Dear Uncle Ned:—I am 5 feet 3 inches tall, have light brown hair and brown eyes, fair complexion and am 11 years old and in the 5th grade at school. I have to walk a mile and three quarters. I think the poem in the M. B. F. "The Wood-box" was a nice poem and I must carry in the wood for the cook stove and I do not like to carry wood in the winter time. We have a river about one-quarter of a mile from our house and in the summer we go swimming. I think it is good sport. Good-bye. Your niece and cousin, Elizabeth Dieterman, R. 4, Marion, Michigan.

85 Pound Standard
Slate Surfaced Roofing
$2.00 Per Roll

Lay Your Own Roofing This Spring

Do it in your spare time. No experience needed. Only hammer and jack knife required. Use our standard Radio Slate-Surfaced Roofing.

SURE QUICK DEATH FOR RATS AND MICE

REMARKABLE TRIPLE STRENGTH VIRUS KILLS EVERY ONE—NOT A POISON

You can now easily and quickly kill all rats, mice and gophers with Triple Strength Virus—the most powerful concentrated virus known—the sure, safe way to destroy rodents. Positively not a poison. Harmless to humans, pets, poultry, stock, etc.—affects only rodents.

RATS DIE OUTSIDE

Rats flee because they become infected with a plague that affects the heart, blood vessels and lungs destroying the blood corpuscles and causing suffocation. Rats rush outside to get fresh air and water. When the diseased rats get outside, they never get back for the disease is then so far gone it kills them. No odor, no dead rats to handle, no live rats to kill.

SPECIAL INTRODUCTORY OFFER

To introduce this powerful Triple Strength Rat Virus, we will make every reader of this paper—for a short time only—a special offer of a regular $2.50 bottle for only $1, postpaid. This $2.50 bottle Triple Strength Rat Virus is enough to clear a poultry house, home or yard of rats and mice. Should you have several buildings infested with rats, it will pay you to send $2.00 for our big $5.00 Jumbo Size bottle. This Jumbo Size bottle contains three times the quantity of Triple Strength Virus as our regular $2.50 bottle. Send order today, sure. Give it according to directions—if after 30 days' trial you find any rats or mice—we will refund your money without question.

If not convenient to send money today—just send your name and address, a postal card will do—pay postman on arrival. Remember, it costs you nothing if it does not do all we claim. Agents wanted in every community.

MICHIGAN BUSINESS FARMER
"The Farm Paper of Service"

IS THE MIDWAY NECESSARY TO SUPPORT OUR FAIRS?

(Continued from page 4.)

should go, there was the usual protest, but the Ohio State Fair, known as the cleanest exhibition of its kind in the country, has continued to make progress. Ed. S. Wilson, manager of the Ohio State Fair says, "The Ohio State Fair has no shows of any kind, no midway or games of any kind on its grounds. We have three riding devices for the amusement of the children; also we sell the novelty privilege and wire jewelry privilege so that patrons may have the opportunity to obtain souvenirs. Aside from the sale of these articles, we have eliminated all small articles from the ground, such as potato peelers and fountain pens. Anything sold on the grounds must be sold from space which is sold for exhibition purposes and no one is allowed to bark or cry their wares. We try to put on a strictly educational show.

"We have the free acts which we pay for ourselves and which we aim to have of the highest order. These are put on in front of the grand stand and in the coliseum at night in connection with the night horse show.

"Our fair has increased in attendance and in the class of its attendance and is considered a model fair. He can see no place at an agricultural fair for cheap shows, gambling devices, etc., and consider that they can do nothing but detract from the real purpose of the fair. The class of patrons these exhibits would draw would in no wise help a fair."

No Wheels of Chance in Iowa

A. R. Corey, secretary of the Iowa State Fair, says, "Practically all the larger and successful fairs have eliminated gambling devices and questionable shows. As for the Iowa State Fair, we have not permitted a wheel of any kind, doll racks or any other kind of such device on the fair grounds for at least fifteen years. We do, however, have a midway. The shows are inspected two or three weeks before a contract is made. Our midway consists largely of riding devices and a few worth-the-money shows. I feel safe in saying that there is no other fair in the United States attended by so many people from the rural sections. We provide free music and put on high class entertainment. We also have automobile races, but they are not of a hippodrome character. We have real copetition in our races."

It seems that the cleaning up process has proved most beneficial to the Ohio and Iowa State Fairs. At these great fairs one no longer is greeted with a blare of discordant clatter of alleged jazz bands; the hammering of gongs and the ear bursting blasts of other noise-making devices in order to attract the attention of patrons to a semi-nude parade of highly painted dames in front of a tent show. They do not have those kind of shows, or the man along with them who slyly winks at the unsophisticated in an effort to convey to them the idea that they can see something rich, rare and racy on the inside. They have gone back to solid ground, realizing that the foundation of all fairs and expositions are constructed on the agricultural, livestock and kindred industries, not forgetting manufacturing and other industries, or the fact that good entertainment and good sports should not be neglected.

We have in the Southwest, as in all other sections of the country, many fairs and expositions. They are all serving a useful purpose and to those who have given their time and energy in building them to their present power may be ascribed much of the progress and development of the country. They have and are yet rendering a service of almost incomparable value to the people. The greatest of all of the fairs is the State Fair of Texas, which for thirty-six years has been the recognized leader in encouraging better livestock, better poultry and diversified agriculture. The Fort Worth Fat Stock Show, the Cotton Palace at Waco, the South Texas Fair, at Beaumont, the Houston Fair, and the Fairs at San Antonia, Wichita Falls, Abilene, Pittsburg, Tyler and the many other county and district fairs in Texas and in other Southwestern States, all have a wide influence in promoting industry. All should receive the patriotic support of the people even to the point of offering suggestions and criticisms. The criticisms and suggestions in this and a previous article are not directed at any particular fair. They are broadcasted to be picked up by director or manager who may desire to tune in.—Texas Farm and Ranch.

THE HUNTED WOMAN

(Continued from page 13.)

now. I hate divorce as I hate the worst sin that bars one from Heaven. It is the one thing that I hate. And it is because of this hatred that I suffered myself to remain the wife of the man whose name is over that grave down there—Mortimer FitzHugh. It came about strangely—what I am going to tell you now. You will wonder. You will think I was insane. But remember, John Aldous—the world had come to hold but one friend and comrade for me, and he was my father. It was after Mindano. He caught the fever, and he was dying."

For the first time her breath choked her. It was only for an instant. She recovered herself, and went on:

"Out of the world my father had left he had kept one friend—Richard FitzHugh; and this man, with his son, was with us during those terrible days of fever. His father, I thought, was the soul of honour, and I accepted the son as such. We were much together during those two weeks of my despair, and he seemed to be attentive and kind. Then came the end. My father was dying. And I—I was ready to die. In his last moments his one thought was of me. He knew I was alone, and the fear of it terrified him. I believe he did not realize then what he was asking of me. He pleaded with me to marry the son of his old friend before he died. And I—John Aldous, I could not fight his last wish as he lay dying before my eyes. We were married at his bedside. He joined our hands. And the words he whispered to me last of all were: 'Remember—Joanne—thy promise and thine honour!"

(Continued in March 17th issue.)

THE TRUTH ABOUT HENRY FORD

(Continued from page 8.)

butcher shop on the way and bought a number of choice steaks so that "J. B." could prepare what he called "brigand steaks." Here are the directions: Place a steak, a slice of bacon and an onion on a long green stick and hold over the hot coals, turning often. Mr. Ford, although he had never mentioned it, hired men to clear up Mr. Burroughs' land and also paid off the mortgage so that the naturalist would not lose his paternal homestead. This Mr. Burroughs mentioned in his will.

Mr. Ford still takes a keen delight in skating, and the small lake on his estate is kept clear of snow from the first freeze to the coming of spring. There Mr. Ford spends many winter evenings gliding over the ice. It is to such pastimes as this, no doubt, that he largely owes his excellent health. He has lived all his life practically in the same spot and even today he seldom leaves the vicinity of Dearborn for any length of time with the exception of a summer cruise on his yacht, a hasty trip of inspection or for a brief trip with old friends.

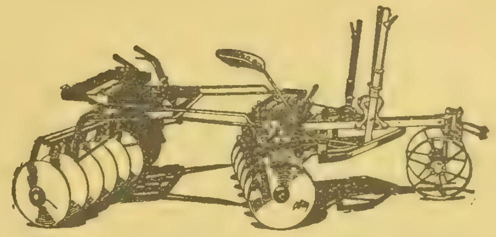
(Continued in March 17th issue.)

The Colonel had a colored hired man who was absent from the farm on Sunday and Monday and finally appeared on Tuesday in a rather dilapidated condition.

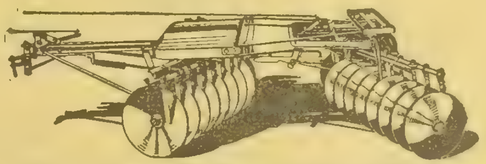
"How's this, Sam?" he inquired. "What's been happening to you?"

"Well, suh, you know Sat'dy was payday, and after supper we gets into a big crap game. 'Long come 'bout two o'clock in de a. m. and Napoleon Sims gets into a li'l friendly argument. Cunnel, befoh I know it he hits me in de mouf and he knocks out fo' teef, and he hits me in de eyes and blacks dem, and he blame near busts mah nose and mah jaw. Den he gets me down on de ground and stomps on me and cracks three ribs. Fo' God, Cunnel Ah never got so tiahd of a man in all mah life."

McCormick-Deering
Tillage
Implements



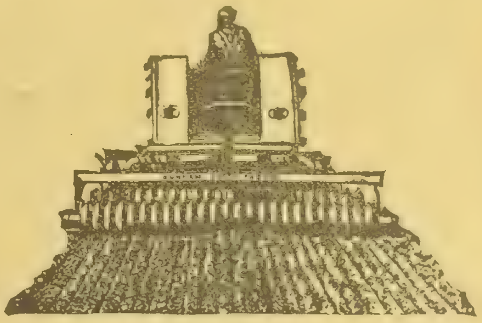
The *McCormick-Deering Disk Harrow* is a simple and efficient implement, built and trussed like a steel bridge, to serve many years. You will like the details and conveniences—the dust-proof bearings and the bearing oil cups set above the frame, the built-in angle-steel weight boxes, the oscillating disk scrapers, the forecarriage, etc. Made in sizes for everybody—4 to 10 feet. All sizes can be equipped with the tandem attachment which is shown above. Double disking is popular—farmers know that it more than pays for itself.



The *McCormick-Deering Leverless Disk Harrow* is a genuine tractor disk, not a made-over horse harrow. It is built for heaviest duty. It is controlled entirely from the driver's seat, without levers, yet it is very simple. Merely backing the tractor automatically sets the angle of both front and rear gangs. When the tractor starts forward the gangs hold that angle until released by a pull on the rope. In 5 to 10-foot sizes to fit your power.

SEED-bed making will call for fast and thorough work this year as always. The planting season will roll around in a twinkling, but no matter how few the days between plowing and planting you can have a profit-building soil by using efficient equipment.

McCormick-Deering Tillage Implements combine the three essentials—good work, long life and convenience. They are of practical design, their construction being based on ninety years of farm and factory experience. They are priced on the basis of economical quantity production, and as an investment they offer you attractive returns.



The *Dunham Culti-Packer* has no equal as a seed-bed finisher. It pulverizes the soil, fills out air spaces, and saves moisture content. Following the drill, it helps the little plants to get a quick start, firmly set in finely mulched soil. Use it to prevent winter-killing of wheat; to rejuvenate meadows, etc. It is far ahead of a roller for small grains. Made in eight sizes, for horse and tractor use.

To Fill All Your Tillage Tool Needs See the McCormick-Deering Dealer. It Pays!

BEGIN AT THE TOP BY USING YOUR HEAD

(That Accounts for its Location)

A woodpecker pecks
Out a great many specks
Of sawdust
When building a hut.
He works like a nigger
To make the hole bigger—
He's sore if
His cutter won't cut.
Doesn't bother with plans
Of cheap artisans,
But there's one thing
Can rightly be said:
The whole excavation
Has this explanation
He builds it
By
Using
His
Head.

MANDY JANE applied this principle when she said, "W'enebber I pray to de Lord to sen' one of my nex' neighbo's fat chickens into my yard, dere is no notice tuk; but w'en I pray dat de ol' man take it into his head to go right ober and get one ob dem chickens, de 'ting is tended to befo' sun up."

We can avoid colds by employing a bit of the same common sense which we all probably possess but which we often neglect to use. This is the time of year when colds are most prevalent and most serious in their consequences often developing into pneumonia and serious bronchial troubles. Let us then refresh our minds with a few don'ts and do's in regard to this really serious and contagious malady.

A generation ago a prominent doctor was asked by a lady how he treated a cold and the answer was, "With contempt, Madam." Well that day is past—now we treat a cold with proper respect and a few remedies knowing that with such treatment it may prove quite harmless.

Here are a few very pertinent don'ts.

If you want to take cold,
Keep your windows shut.

Avoid drafts as if they were a pestilence.

Take no exercise between meals.

Bathe seldom, and in warm water.

Wear heavy flannels, chest-protectors, abdominal bandages, and electric insoles.

Have no heat in your bedroom.

Never let anything keep you away from church, the theatre, or parties, in winter.

Never go out-of-doors when it's windy, or rainy, or wet underfoot, or cold, or hot, or looks as if it was going to be any of these.

Be just as intimate and affectionate as possible with every one you know who has a cold. Don't neglect them on any account.

But if you don't then just remember that if we keep ourselves vigorous, clean and well ventilated, we can defy that cold devil and all his works. Keep the system well flushed by drinking at least two quarts of water daily between meals. One glass of cold water at a meal is enough for any one, more, chills the stomach and retards digestion. Keep the lungs healthy and blood pure with fresh air, not necessarily cold air, for the cold chilly dampness found in the air of a guest-room closed for the winter is full of germs and exceedingly dangerous. There was an old rhyme which went this way, "When a draft blows thru a hole, make your will and mend your soul." We now know that a "draft" of fresh, pure air is going to give us vigor, physical as well as mental. There is nothing more stupefying than a close, stuffy atmosphere.

If your child develops a cold when the weather is mild keep him playing out-of-doors by himself but if stormy and severe keep him in a sunny, well ventilated room by himself, for a few days, he will soon recover and the rest of the family will escape. Give him plenty of warm, easily digested food, eggs, broths, and milk and fruit for laxative purposes. This same treatment is just as good for us grown-ups.

GREETINGS FROM DR. ROGERS.

Dr. Rogers who conducts our Health Department, has been in California since the middle of December. He will return April 1st. Last week the following letter to our readers was received and I am sure you will

The Farm Home
A Department for the Women

Edited by MRS. GRACE NELLIS JENNY

find it interesting. It was particularly interesting to me, who of necessity, do much walking. Verily the law of compensation is still working.

WALKING FOR HEALTH

FEW people walk correctly or know how to stand on the corner and watch other people walk. You will agree with me it is not best to imitate a soldier, his gait is too stiff and stilted. The body should be straight and relaxed. The arms swinging but not too much. The step long and easy with a swing, striking the foot first on the heel but not too hard.

Walking is becoming a lost art and it is one of the finest exercises in the world. The automobiles are largely accountable for it and are the cause of the shortening of the lives of many thousands of Americans.

Everyone should walk at least four miles a day and should be able to do it in an hour or an hour and a quarter, taking all the while long breaths of fresh air. The English people are good walkers and make it a real recreation, we call it hiking to-day. Well call it what you like, but do it any way. Mountain climbing is fine for those who can stand it but we can all do a good deal of walking or running up and down stairs and call it pastime. We are picking roses just now while you people in Michigan are shoveling snow. Does not this make you just a bit envious?—Dr. F. N. Rogers.

—Yes, Dr. Rogers, it does, but just wait, we will also pick roses in a little while and ours have a much sweeter perfume than any you can find in California and our crisp winter air is full of ozone and bottled up pep, that quality that we middle state people are supposed to have a corner on.

NEW EVERY MORNING

Every day is a fresh beginning,
Every morn is the world made new.
You who are weary of sorrow and sinning,
Here is a beautiful hope for you—
A hope for me and a hope for you.
All the past things are past and over;
Tasks are done and the tears are shed,
Yesterday's errors let yesterday cover;
Yesterday's wounds which smarted and bled.
Are healed with the healing which night has shed.
Yesterday now is a part of forever,
Bound in a sheaf which God holds tight;
With glad days, and sad days, and bad days, which never
Shall visit us more with their bloom and their blight,
Their fulness of sunshine or sorrowful night.
Let them go, since we cannot relieve them,
Cannot undo and cannot atone;
God in his mercy receive and forgive them!
Only the new days are our own;
Today is ours and today alone.
Every day is a fresh beginning;
Listen, my soul to the glad refrain,
And in spite of old sorrow and older sinning.
And troubles forecasted, and possible pain
Take heart with the day and begin again.—Susan Coolidge.

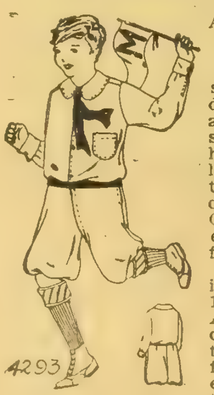
SPRING FASHIONS FOR THE LITTLE FOLKS

Catalogs 12 cents Patterns 12 cents

FASHION BOOK NOTICE

Send 12 cents in silver or stamps for our UP-TO-DATE SPRING and SUMMER 1923 BOOK OF FASHIONS, showing color plates, and containing 500 designs of Ladies', Misses' and Children's Patterns, a CONCISE and COMPREHENSIVE ARTICLE ON DRESSMAKING.

ALSO SOME POINTS FOR THE NEEDLE (Illustrating 30 of the various, simple stitches) all valuable hints to the home dressmaker.

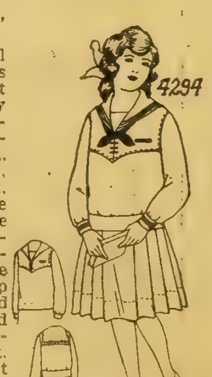


A Comfortable Suit For The Growing Boy

4293. Wool jersey, serge, khaki, linen, drill and gingham are suitable for this style. One could have the blouse of linen or madras and the knickerbockers of cloth or khaki. Corduroy too is an excellent material for the trousers.

The Pattern is cut in 5 Sizes: 6, 8, 10, 12 and 14 years. A 10 year size requires 1 7-8 yard for the blouse and 1 3-8 for the knickerbockers, of 36 inch material.

Pattern mailed to any address on receipt of 12c in silver or stamps.

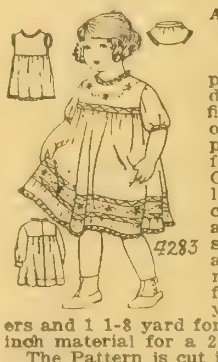


A Popular "Middy" Style

4294. No school girl's wardrobe is complete without several middy blouses, and no garment is quite as comfortable. In drill, Indian head, flannel, khaki, linen and silk, this style will be very pleasing. The blouse may be finished with straight lower edge, or with the now so popular 'hip band." The plaited skirt is to be finished with a band or joined to an under waist.

The Pattern is cut in 5 Sizes: 4, 6, 8, 10 and 12 years. A 10 year size requires 2 5-8 yards for the blouse, and 1 7-8 yard for the skirt, of 36 inch material.

Pattern mailed to any address on receipt of 12c in silver or stamps.

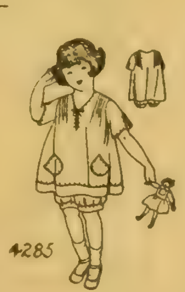


A Dainty Set For The "Little Girls" Wardrobe

4383. This comprises a neat yoke dress that may be finished with or without the ruffle, and a petticoat and comfortable drawers. One may use voile, lawn, batiste or crepe for the dress and cambric or nainsook for petticoat and drawers. It will require 1 5-8 yard for the Dress, 5-8 yard for the Drawers and 1 1-8 yard for the Petticoat, of 36 inch material for a 2 year size.

The Pattern is cut in 4 Sizes: 6 months to 1 year, 2, 3 and 4 years.

Pattern mailed to any address on receipt of 12c in silver or stamps.



A Pretty "Play" Garment

4285. Linen, chambrey, flannel or chintz could be used for this model. A simple finish of stitching or stitchery, or a binding in contrasting color, would be very pleasing.

The Pattern is cut in 3 Sizes: 2, 4 and 6 years. A 4 year size requires 2 5-8 yards of 36 inch material..

Pattern mailed to any address on receipt of 12c in silver or stamps.

LOVE IS MASTER OF ALL ARTS

AS someone has said "Love is master of all arts" I think there is nothing that it can apply to as bringing up children.

To make a success we must love them. Why of course we do. But do they know it? Do not take it for granted that they do. But tell them and explain why they are so dear to us.

How many times as we look back into our own childhood we can easily see what affected us most.

I think we will admit it was when we were taken in a good heart to heart talk when most good came to us. Also when our parents were not angry with us.

I think harsh methods that we sometimes allow ourselves to use only breeds hatred and then we fail entirely.

How many times we do to children what we would not think of doing to some grown up person.

If we expect good tempers, good manners, honesty and happy dispositions we must first set the example.

If you will some time watch their playing with their pets be it dog or cat or dolls or what ever they are interested in, watch if some of your own word and manners are not used.

As mothers we must take time to listen to their troubles (they are real troubles to them) for if we don't the day will come when we will find we are on the outside, and have lost the things that we valued most.

In small children, how they like to have mother or father play with them. A ride down hill, no matter if you are lame the next day—I hear someone say but I haven't time I cannot leave my work.

Make time while you have them and while they want you.

Which is most important whether every speck of dust is moved to lond somewhere else or every dish wiped or whether we give our children the comradship they need?

I think let all unnecessary work go. If we wish we may be model housekeepers when the children have all grown up and gone.

But while we have them in our home—then is the time for us to be real chums with them. And do not forget to let them know how much their good behavior means to us.—Mrs. X. J.

CORRESPONDENCE COLUMN

The formula for a tooth-powder, which you gave in a recent issue, I believe February 3rd, is worth the price of the paper for a year. It is good, cheap and makes your teeth feel just fine. I was another one who wanted a cornstarch cake recipe. Have you any more copies of Lasca? I would like one also.—Mrs. Q.

—I have entirely run out of copies of Lasca and have several requests for same on my desk. I sent out the last one I had and believe if someone will send me another copy I will try to have it published somewhere in our paper to satisfy our subscribers.—Mrs. Jenney.

Who of the readers of the M. B. F., knows the words to the song which begins with these lines:

"Please Mister, take me in your car,
"I want to see Ma-Ma
"They say she lives in heaven
"Is it very, very far?"

I would be very much obliged if you would print it in the Home Department. Mother used to sing it before she left us. What I have written here is all I can remember of it.—Miss M. M.

Mrs. G. H.—A 44 pattern would surely be large enough for you. Get the size by taking the bust measure loosely.

Mrs. McK.—Our book of fashions and catalog are one and the same and a very practical and useful book it is. There are patterns in it for all kinds of underwear for men, women and children. Even a pattern for a splendid home made corset waist which is simple and easy to make and give one good lines for the present-day dress.

I am a reader of the M. B. F. and I notice that someone asks how to remove rust from white linen. The lemon juice and salt are all right, but I have a product that works like magic on rust and ink also without

the aid of the sun. Have handled it for a number of years in Aid Societies to which I have belonged. If any of the readers of the M. B. F., are members of clubs, aid societies, or organized Sunday School classes and are interested in a very practical household product and would like an easy to add dollars to their treasury at the same time, write me and I shall be glad to give you the necessary information. Please enclose stamp.—Mrs. D. F. Warner, Kittanning, Pa.

FLOUR SACK GARMENTS

I GET flour sacks at the baker shops, 12 at a time, wash and bleach them out. I make large pillow cases and take just as much care with them as if I had pillow tubing. Some I put lace on. I make aprons for myself, also every-day underskirts, children's panties and underwaists. My neighbor even makes sheets of them. They make fine picnic spreads, something nice and white and nothing to spoil if things are spilled which always happens at a picnic.

Another help is that I put my two little girls in play skirts for summer. I make them out of khaki cloth. In the warm weather they don't need anything else on. This of course saves washing.

I found when I have trouble with starch sticking on the iron, it can be helped by putting white laundry soap in the starch. Just take the bar of soap and swing it around in the hot starch, it also makes the cloth glossy.

I have canned sausage and I always make it in little pats, and pack it in two-quart syrup pails, seal over with lard, leaving a space in the top of the pail, place a white cloth on top and pack in salt. This seals it air tight.

I think if Mrs. J. M. will try this she will like it very much.—Mrs. E. Short, Manistee County.

ON CHILDREN

I'LL send you a small article on children. I am glad you are bringing it up in your paper. I have two children, a boy of twelve and a girl of eleven years and sometimes I feel like such a failure.

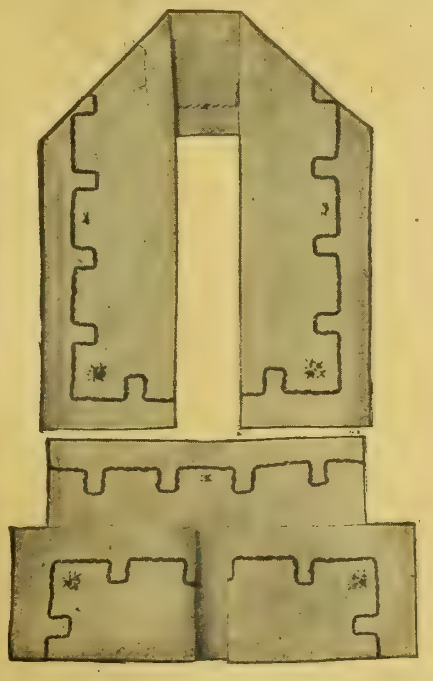
When I am sick, however, they are so good and do so much for me and keep the work done up so well that I feel they are pretty good children after all.

As you have visited on the East side of Trombly mountain I will have to tell you that our home is on the West side and we have such a pretty view from our home at evening when the sun is setting and in the morning at sunrise.

I like your page fine, I think it gives so many helps. Remember our latch-string is always out if you ever come this way. Last June I was so sorry our Farmer's Club reached your office too late to see you.—Mrs. Mark Chamberlain.

COLLAR AND CUFF SET

This Spring brings forth once more the collar and cuff set of organdie. You will find such a set very popular and a nice addition to your wardrobe. Work the design in a heavy rope silk. A vest is also pictured here.



Are your Bakings Always Uniform?

The very first time you use Calumet your baking will be perfectly raised, sweet and wholesome. And you can expect unfailing uniformity just as long as you continue to use it, because

DAIRY and LIVESTOCK

ANNUAL MEETING OF MICHIGAN HOLSTEIN-FRIESIAN ASS'N.

THE annual meeting of the Michigan Holstein-Friesian Association was held in the Agricultural Building at the Michigan Agricultural College, January 31st, President Dudley E. Waters, of Grand Rapids, in the chair.

The President's address outlined a broad program of work for 1923 under the new co-operative arrangement with the Dairy Extension Department of the College by which Mr. James G. Hays is employed as Holstein specialist. Plans are being made to re-organize the county associations and get them started on definite lines of constructive work under the county manager plan, and to organize counties where associations are not already in the field.

Earl J. Cooper, Extension Representative of the Holstein-Freisian Association of America, discussed the calf club program, illustrating many phases of club work with lantern slides. Following Mr. Cooper's talk Mr. D. D. Aitken donated $100.00 to pay special calf prizes for the past year, and a resolution was passed endorsing the calf club program and pledging support throughout the state.

Professor O. E. Reed, of the Dairy Husbandry Department of the M. A. C., addressed the meeting, discussing the work of the Dairy Department and the co-operation with the Michigan Holstein-Friesian Association through the employment of a Holstein Specialist, Mr. James G. Hays, whose time will be devoted to Holstein matters. Mr. Hays will be available to assist county Holstein organizations and will help organize calf clubs, bull associations, and cow testing associations.

After considerable discussion, the dues were changed to $2.00 per year and the Board of Directors was reduced from fifteen to nine members, to be elected for one year.

Officers were elected as follows:

President, E. L. Smith, Adrian; Vice-President, W. R. Harper, Middlesville. Directors: E. L. Smith, Adrian; W. R. Harper, Middlesville; J. Neal Lamoreaux, Comstock Park; James I. Post, Hillsdale; H. W. Norton, Jr., Lansing; S. H. Mumsell, Howell; G. L. Spillane, Flint; M. W. Wentworth, Battle Creek; and R. F. Sloan, Charlevoix.

The Board of Directors will elect a secretary and treasurer at their first meeting, to be held February 17th.

Resolutions were adopted endorsing the five-year program for bovine tuberculosis eradication as outlined by the livestock breeders' conference and urging the passage of bills before the legislature to provide funds for the campaign, and endorsing the filled milk bill now before the legislature.

SHORTHORN FUNCTIONS WELL ATTENDED

THE Forty-second Annual Meeting of the Michigan Shorthorn Breeders' Association was held at the M. A. C., Thursday, February 1st, seventy breeders being present. In the absence of President George A. Prescott, Jr., Vice-President S. H. Pangborn occupied the chair. M. E. Millar of Greenville, Michigan, gave a very interesting talk on "Milking Shorthorn Development," showing something of the progress made by the milking Shorthorn during recent years. The Association was very fortunate in having with them F. W. Harding, General Executive of the American Shorthorn Breeders' Association, Chicago, Illinois, who gave a very interesting talk on "The Present Shorthorn Situation." The following resolution was unanimously indorsed by the breeders present:

"WHEREAS, The Boards of Supervisors of the thirty-three counties in Michigan have already appropriated funds to the extent of $175,000 to co-operate with the State and Federal Bureaus of Animal Industry in the control and eradication of bovine tuberculosis within those counties, and demands for this work are constantly increasing, and

WHEREAS, The funds provided for the Bureau of Animal Industry of the State for carrying on this work are now and have been for some time past, completely exhausted, and

WHEREAS, We recognize the importance of testing all cattle in the State and eradicating this disease as rapidly as possible as a matter of ultimate economy not only to the livestock owners, who bear a large part of the loss, but also to the general taxpayers of the State, and

WHEREAS, We believe that this is one of the most important measures before us at this time as dealing directly with human health and particularly the health and welfare of the children of the State

THEREFORE, BE IT RESOLVED, By the Michigan Shorthorn Breeders' Association in annual meeting assembled, that we go on record as favoring enactment by the present session of the Legislature of adequate measures for the expansion of the work of bovine tuberculosis eradication now being carried on by the Bureau of Animal Industry of the State and the adoption of the five-year program proposed by the Livestock Breeders' Conference held at Lansing, December 21, 1922, as appended hereto, and that we commend highly the action of the Governor and Administrative Board in providing emergency funds in order that this work could be continued during the past year."

The officers elected for the coming year are:

President, S. H. Pangborn, Bad Axe, Michigan; Vice-President, M. E. Millar, Greenville, Michigan; Secretary-Treasurer, W. E. J. Edwards, East Lansing, Michigan. Directors, Frank Lessiter, Clarkston, Michigan; J. Smith, Ann Arbor, Michigan; Fred Hebblewhite, Armada, Michigan; Thomas Martin, Ionia, Michigan, and H. W. Hayes, Chelsea, Michigan.

The annual banquet was held the same evening in the Wildwood Inn, W. C. Kellogg acting as Toastmaster. Among the speakers were R. J. Bidwell, Tecumseh; W. C. Rosenberger, Tiffin, Ohio; Professor G. A. Brown, East Lansing; President S. H. Pangborn, Bad Axe; Dr. J. P. Hutton, Lansing; and F. W. Harding of the American Shorthorn Breeders' Association, Chicago, Illinois.

A shorthorn Show of the sale cattle was held Friday morning. This show attracted a great deal of attention and the placing of the ribbons by Mr. F. W. Harding was watched with keen interest.

The annual Association Sale was held Friday afternoon, February 2nd. A very large crowd of farmers and breeders was present and while the prices obtained were not high, it was quite apparent that those present are looking for improved livestock conditions in the near future.

The top of the sale, May Amaranth 943790, consigned by John Lessiter's Sons, Orion, Michigan, and sold to W. C. Thatcher, of Flint, Michigan, brought $310.00. The highest priced bull, DaleLeader 1113954, was contributed by the same breeder and sold to T. J. Rixon, Britton, Michigan, for $210.00. Twenty-five females made an average of $138.00, while seven bulls sold for an average of $163.00.

RED POLLED CATTLE CLUB

Following is a short report of our annual meeting which was held at East Lansing, Jan. 31, 1923. We had a very interesting meeting and took in several new members following are the officers elected.

President, N. C. Herbison, Birmingham, Mich.; Vice President, R. L. Finch, Saline, Mich.; Secretary-Treasurer, Mark R. Westbrook, Ionia, Mich.; Director, 3 years, Robert A. Randall, Armada, Mich.; Director, 2 years, John E. Killick, Doster, Mich.—Mark R. Westbrook, Secy.

DUROC JERSEY MEN REORGANIZE

The Michigan Duroc Jersey Swine Breeders association, after a lapse of two years in association activities, came to life at the college Tuesday and effected complete reorganization of their groups. Thirty men attended the meeting, and laid plans for future expension of the association's activities.

C. C. Terrell, President of the Ohio Duroc Jersey Swine Breeders association delivered the principal

Spring is Here

All out-of-doors is filled with the bleat of the lamb, the bawl of the calf, the grunt of the pig, and the whinny of the colt.

Youth asserting itself everywhere!

Keep their bodies healthy, and stomachs full.

You can then count on good growth—quick development—and begin to cash in on them before the summer-end.

Let

DR. HESS STOCK TONIC

be your insurance policy

against disease, insurance of good appetite, good digestion. It keeps the worms away.

Then, there are the mothers:

Your COWS need it for its system-toning, bowel-cleansing, appetizing effects. Puts them in fine condition for calving.

Your BROOD SOWS will be relieved of constipation and put in fine fettle for farrowing.

Excellent for MARES in foal—and EWES at lambing time.

It makes for good appetite, and more milk to nourish the offspring.

Tell your dealer what stock you have. He has a package to suit. GUARANTEED.

25 lb. Pail, $2.25 100 lb. Drum, $8.00

Except in the far West, South and Canada.

Honest goods—honest price—why pay more?

address at the session, talking on the general subject of "Salesmanship." Terrell pointed out the need of adequate selling methods in the pure bred hog game, and gave the features which make the Duroc Jersey Breed one of the most popular in America

At the close of the meeting the association passed a resolution favoring raise in pay for federal men working on hog cholera eradication in the state.

DEFICIENCY OF MINERAL MATTER AND BULK IN RATION

I have a Poland China sow, 4 months old, that has been in perfect health up to about a week ago, when I fed her one day, she just started to take her feed when she had a sort of convulsion or fit, fell on her back, with legs stiff and trembles all over, for perhaps 5 to 8 minutes, then she got all right and went to eating, giving a sort of squealing and grunting noise. She is getting poor, and has had the same thing every time I feed her since. No black teeth, quarters clean, but is in a small pen and does not get a great deal of exercise. Pen is about 10x10 feet. Can you tell me the trouble and give a remedy? She has had corn, ground corn, oats, wheat and rye, mixed with skim milk or water for slops, have been feeding 6 or 8 ears of whole corn per day.—A. L. W., Brighton, Michigan.

—From the symptoms which you describe and the ration you are feeding, I believe that this sow is suffering from a deficiency of mineral matter and bulk in her ration, also from a lack of exercise.

I would, by all means, advise turning her out for exercises each day, or better still giving her the run of a barn yard. Likewise, give her access to some clover or alfalfa hay and keep a mineral mixture before her at all times.

Unless some skim milk is available to feed regularly, it would be well to feed a small amount of digester tankage or oil meal in her ration when skim milk is not at hand. If tankage is being used, about one part tankage for each ten parts of the grain which you have would be sufficient. If oil meal was being used, about one-seventh of the ration might well consist of the oil meal.—Geo. A. Brown, Prof. of Animal Husbandry, M. A. C.

PREVENTING HORNS WITH CAUSTIC

Please inform me in your next issue , as to how to remove the horns of little calves with caustic, or is there anything any better?—D. H., Boyne City, Michigan.

—The use of caustic is perhaps one of the best methods of preventing the growth of horns on calves. The horns should be killed as soon as they form a distinct button so that it can be readily relt. This will usually be at about three weeks of age.

The hair should be removed from about the horn, the base of the horn scraped with a knife or other instrument, until the serum starts to ozze out or it becomes moist. The base of the horn should be rubbed with a stick of caustic until a distinct ring appears. Ocassionlly with n experienced operator, a second application is necessary although this is seldom the case.

The stick of caustic should be wrapped with a paper and only the end which is coming in contact with the horn left exposed, as it will burn the fingers very severely if not handled in this way and should be kept in a tightly corked bottle when not used, for if exposed to air, it dissolves.

Care should be taken not to apply too much as if any of the material runs down onto the head, it will burn the calf's head and remove the hair.—Prof. Geo. A. Brown, Dept., of Animal Husbandry, M. A. C.

TURN COW DRY

Please let me know how long should a person turn a cow dry before she comes fresh.—I. E., Grand Junction, Michigan.

—A cow should always be turned dry at least a month before she freshens and better if six weeks. A cow needs this length of time to recuperate and make preparations for the next year. This is one of the most important times in the cow's life as far as milk production is con-

(Continued on following page.)

DE LAVAL CREAM SEPARATOR PRICES

A word about De Laval Cream Separator prices to prospective 1923 purchasers is pertinent at this time.

De Laval prices were reduced last year to practically the pre-war level, allowing for increased capacity and other improvements made meanwhile.

This reduction was made in anticipation of a further reduction in labor and material costs. The reverse has happened. Labor and material costs are going up rather than down.

If they continue to do so De Laval prices will have to be advanced. They are now too low. The economies possible through greatly increased production can alone permit of their remaining so.

In any event, De Laval prices cannot be reduced. They may easily have to be advanced at any time. The safe thing to do is to buy now and take no chances.

This is the more so by reason of the fact that 1923 De Laval machines are even better than ever before, that dairying was never more profitable, and that no one having use for a cream separator could ever less afford to be without the best or to continue the use of an inferior or half-worn-out machine.

Why not see your local De Laval agent at once or write us direct at the nearest address given below?

KOW-KARE
THE HOME COW DOCTOR

Herdsman Tells of Wide Experience with Kow-Kare

Paul A. Chadwick of Corona, Cal., writes us a typical letter on the results of his use of Kow-Kare in the dairy. He says:

"I am a herdsman for the Jameson Estate and I am having difficulty to convince the manager of the value of KOW-KARE. We are troubled with abortion, retained afterbirth, and barrenness, all of which I can prevent with KOW-KARE and I have had 100% results with barrenness, never in sixteen years with several thousand cows in several states failed to get cows with calf after three months' continuous use. I have used about a ton of your product and some Garget Remedy as well as Bag Balm. My father used KOW-KARE when I was very young and never had a case of abortion, and only one case of retained afterbirth in over twenty years."

That KOW-KARE can and does accomplish such wonderful results is not strange. The medicinal properties of the remedy build up and put into healthy operation the digestive and genital organs. It is in these organs that most diseases of cows are centered—and it is these same organs that regulate the flow of milk.

During the months of winter feeding the milk-making functions need outside support.

BOOK FREE

KOW-KARE furnishes this help. Just a tablespoonful in the feed twice a day for one week in each month will show a big increase in the yield of milk. The use of KOW-KARE before and after calving assures more robust cows and healthier calves.

We have a thirty-two page book that tells just what to do in case of cow illness. It is called "The Home Cow Doctor" and is yours for the asking. Thousands of cow owners ask for it each year.

Feed dealers, general stores and druggists have KOW-KARE—$1.25 and 65c sizes. If dealer is not supplied we will mail, postpaid, on receipt of price.

cerned, as well as very important in the life of the young calf. Too many people turn the cow to the stalk field or to the back pasture in the summer time and at least do not feed her very well before she freshens. A cow should have full feed while she is dry and should be fed about the same feed as she would normally receive when about half through her milking period. This gives her an opportunity to build up and fleshen up as nature demands. A cow that is feed well before she calves and comes in in good condition will give a higher percentage of butterfat in her milk than will one in thin condition. She will also give more milk.—O. E. Reed, Professor of Dairy Husbandry, M. A. C.

DIPPING SHEEP

ONE of the most important requisites in the successful management of sheep is that the fleece and skin be kept a clean, healthy condition and free from parasites.

The external parasites that often cause serious lisses are the tick, louse and scab mite. The tick is a blood-sucking parasite. When present in a flock, more feed is required to winter the sheep and the quality of the fleece is injured. The louse is a skin-eating parasite. It causes the sheep considerable pain and result in a large proportion of the wool being pulled.

The scab is a microscopic parasite that feeds on the skin causing a watery exudate that forms a hard scab. Under this scab, the mite feeds and multiplies very rapidly, causing intense irritation, pulling of the wool and rubbing the affected parts, and eventually resulting in the death of the sheep unless proper treatment is given.

Sheep can only become infested with scab through coming in contact with infested sheep or quarters. The flock should be dipped immediately upon discovery of infestation with scab and the dipping repeated in ten days. Every flock should be dipped twice each year to keep the skin and fleece in a healthy condition as well as destroy ticks and lice. If the dipping is done as soon after lambing and shearing as the weather will permit, less dip is required and the she can be handled easier than at any other time. After shearing, the ticks will go from the sheep to the lambs, making it necessary to dip the lambs.

Any one of the standard dips on the market will prove satisfactory. At the College, we have found the coal tar dips especially satisfactory. The water used in mixing the dip should be warmed to a temperature of 90 degrees Fahrenheit and each sheep held in the solution for two minutes, the head being immersed just before leaving the vat.—Prof. George A. Brown, Dept. of Animal Husbandry, M. A. C.

VETERINARY DEPARTMENT

CAUSE OF STERILTIY

I have a large cow weighing about fourteen hundred pounds. This cow is half jersey and half holstein. She has a record that I believe not many cows have. This cow came in with her first calf in Nov., 1916. She has not missed one single milking up to this day. She has had three calves in the six years, she had her last calf July 29, 1920 and is giving eighteen pounds of milk a day now.

I cannot get her with calf this time. She comes in heat every three weeks and is healthy in every way so far as we can see. Is there anything or any way to get her with calf? She would be worth any two cows I have if I could get her with calf.—P. M., Farwell, Mich.

—It is impossible to state the cause of sterility in a case of this kind without a personal examination. Infection of the cervix or of the tuber or both might be factors assocoated with sterility. The fact that this cow has been giving milk continuously for over six years without having a period of rest during that time may be an important factor in sterility. This cow has certainly been overworked and overwork is very likely to lower the potency of an animal. If the cow were dried up for a few months, fed liberally and allowed all the exercise she is inclined to take, her condition might be improved. As soon as pasture is available she should have access to a legume pasture. An examination should be made of her reproductive organs by a qualified veterinarian to determine if there are any changes that might be factors in sterility. The fact that she is coming in heat regularly indicates that the reproductive organs are not likely to be seriously deranged and I am inclined to believe that overwork is the underlying cause of her trouble.—E. T. Hollman, Associate Professor of Animal Pathology, M. A. C.

CAN COMPEL TESTING OF CATTLE FOR TUBERCULOSIS

Can you give your readers the law and rulings on tubercular testing of cattle? Must we submit our cows to be tested every 60 days? We are being told a lot of stuff, I fear is not so. We wish to go right, but it seems like a large problem now in many ways.—W. J. F., Hillsdale, County, Michigan.

—The Attorney General has ruled that the Commissioner of Agriculture has the power to compel the tuberculin test of any herd of cattle. This power is being utilized in those counties in which co-operative tuberculosis eradication work is being conducted. Hillsdale is one of those counties.

Herd tests are required only at reasonable intervals. If a herd is clean, the owner is not required to subject the herd to another test for a year. No effort is being made to subject any herd to a test every 60 days. It is customary, when a herd is demonstrated to be infected with tuberculosis, to conduct tests at intervals of six months.

In Hillsdale county it is possible that tests upon some of the infected herds may be conducted at intervals of less than six months, owing to an effort which is being made to classify Hillsdale county as a Modified Accredited Area.—B. J. Killham, State Veterinarian.

LICKING DISEASE OR PICA

My cattle eat on all the old boards they can get; also rub the root of the tail till it sometimes makes a scab. What will I do for it? F. B., Central Lakes, Michigan.

—The cattle are probably suffering from what is called "Licking Disease" or "Pica" a perversion of the appetite manifested by a craving for unnatural food. The affected animals will gnaw, lick and even eat objects which they would not touch in health.

It occurs most commonly among cattle that are kept stabled continuously and especially during the winter months. The cause of the disease is not known. The course of the disease is chronic at times animals show improvement, then getting worse again. A change of food will sometimes bring about a cure. The cattle should be kept in a stable that has plenty of good light and ventilation. If stable is damp that should be corrected.

There is no specific drug for this disease. Apomorophine given three times daily for three days in succession in two or three grain doses has been much recommended.—John P. Hutton, Asso. Prof. of Surgery and Medicine, M. A. C.

55 YEARS OF WEDDED LIFE

Dear Mr. Slocum—As we think so much of your paper, I am taking advantage of your offer and am sending you one dollar to renew my subscription for one year from 1923 to 1924, and adding a new subscriber for one year. We have taken quite a few farm papers in our 55 years of wedded life, but we think yours beats them all in truth and honesty. Yours in sincerity, Geo. W. Dwagart, Clinton County, Michigan.

MICHIGAN CROPS

RENEWING STAND OF ALFALFA

Having had considerable experience in renewing alfalfa I wish to say to inquirer N. S. A. (page 11, Feb. 3rd issue) that I would leave the alfalfa. Half a stand will pay well, and if left you can see just where the bare spots are and apply the necessary elements where needed to renew the fertility of the soil. Harrow whole field or just spots, sow seed and harrow again. Sow between April 1st and August 1st whenever conditions are right. A good time is immediately after cutting. If doubtful about results you can use white blossom sweet clover (on account of cheapness of seed) until desired results show.

I had many bare spots on sandy soil and cured them all with additional applications of marl. Use three to ten yards per acre. Experiments with Sudan grass on these light gravely soils have proven mostly failures.—V. P. Kalamazoo.

SWEET CLOVER AS FERTILIZER

I would like to ask through the Business Farmer if sweet clover is as good for fertilizer as barnyard manure.—R. L. M., Breckenridge.

—Sweet clover is a leguminous crop and when inoculated is able to make use of the free nitrogen of the air. If grown continuously for several years on the same field and plowed under the nitrogen and organic matter of the soil should increase. When this organic matter decays it is quite likely that additional phosphorus and potash will be made available. However, the total supply of phosphorus and potash in the soil will not be increased.

Barnyard manure contains nitrogen, phosphorus and potash and also considerable organic matter that is in a more or less decaying condition. Consequently, barnyard manure will increase the nitrogen, phosphorus and potash content of the soil while sweet clover will increase the nitrogen content only.—C. R. Megee, Farm Crop Department, M. A. C.

PLANT FLAX WITH OATS

I have a piece of ground which I wish to seed down in oats, and most of it has been manured quite heavily for two years. I think under a normal year my oat straw would grow so tall that a strong wind would lay it flat. Can I seed flax with my oats for a support and will the flax and oats get ripe at the same time and can they be threshed successfully with the threshing machine? And if so how?—C. H., Posen, Michigan.

—Oats and flax planted together under Michigan conditions mature at nearly the same time. Flax usually ripens a little earlier but will stand without damage until the oats are ripe. The practice of seeding oats and flax together was quite common during the war years when oil meal was at a high price. The oats and flax can be threshed together with the ordinary threshing machine and separation can be made later by use of the fanning mill.

Under present conditions I believe you will get better results by seeding a stiff strawed variety of oats without the flax, using two hundred and fifty pounds per acre of acid phosphate. The Worthy variety is known to be much stiffer strawed than ordinary oat varieties and should give good results under the conditions you describe.—J. F. Cox, Professor of Farm Crops, M. A. C.

CLOVER ON SAND

Is it better to sow Mammoth clover alone in early March or with oats in April, on sandy soil? Will oats rob the clover of moisture later on? —Mrs. A. G., Rothbury, Michigan.

—On slight sandy soil Mammoth clover will stand a better chance of producing a crop when seeded alone than when seeded with a nurse crop like oats. The oats tend to shade the clover and also utilize moisture that is needed very badly by the young seeding.

In some sections it is advisable to sow a small amount of oats, three or four pecks, with the seeding to prevent sand particles from blowing and thereby causing considerable injury. A large amount of the damage caused by a nurse crop is done the last three weeks that it is on the ground. In this case it is advisable to cut the oats for hay, which will allow the seeding to make use of availible moisture.—C. R. Megee, Farm Crops Dept., M. A. C.

SOWING SWEET CLOVER

Would like to have some advice on sweet clover. I have a field I wish to seed to sweet clover this spring to plow under. Red clover grows good on this field, would it pay me to sow the sweet clover? Would it make more growth to plow under? Can it be seeded the same way you would sow red? Of course I do not know about the acidity, but the red clover grows rank considering the difference in cost of seed and amount of growth to turn under. Would you try it once?—H. B. Vermontville.

—Sweet clover is a little more sensitive to soil acidity than red clover but since you state that red clover grows quite rank you are not likely to experience any difficulty in securing an excellent growth of sweet clover. Sweet clover will produce a higher tonnage of dry matter in both tops and roots the first season than will red clover. The seed of sweet clover is also somewhat cheaper and for a crop to plow under we believe that under the present conditions is the more economical one. —C. R. Megee, Asso. Prof., Farm Crops Department, M. A. C

DIAGRAM FOR SCARIFYING MACHINE

Please give digram of sweet clover scarifying machine.—J. S.

—A diagram for the Ames sweet clover scarifying machine may be secured from the Farm Crops Department of the Iowa State College, Ames Iowa. This machine was invented by Professor Hughes who is Chief of the Crops Department at Ames. A diagram for constructing the machine may be secured from him free of charge.—C. R. Megee, Farm Crops Dept., M. A. C.

A Six-Horse Hitch

C. L. Brody, Secretary-Manager, of Michigan State Farm Bureau, and J. W. Nicolson, Mgr. of Seed Dept., inspecting seed at threshing time near Oasis, Utah.

Utah Common Alfalfa Seed

Farm Bureau Brand Utah Alfalfa Seed is the cheapest, Michigan adapted Alfalfa Seed on the market.

Inspected while growing and after threshing by representatives of the Farm Bureau Seed Department.

Grown at an altitude of 4500 feet under severe climatic conditions our high quality strains, free from noxious weeds, will give results.

For short rotations we recommend this seed. For permanent fields use Grimm, Cossack or Michigan grown Farm Bureau Brands.

About 10,000,000 pounds of Alfalfa Seed has been imported each year for the last three years.

Don't take a chance on these imported seeds. We do not handle them.

Contagious Abortion
Can be Stopped in Cows and Sows

Erick Bowman
Discoverer of the
Bowman Abortion Remedy

That statement applies to Your herd. It's no use to worry about past losses which this dread disease may have caused. The important thing to do is to save yourself from future losses by stamping out every trace of Contagious Abortion Now.

The Bowman Abortion Remedy has behind it a record of positive results in the thousands of cases where it has been used. These should recommend it to anyone facing the problem of how to eradicate Contagious Abortion. The experience of satisfied users is your best guide. The Bowman Abortion Remedy will positively rid your herd of Contagious Abortion. Any farmer can administer it with ease. Cattle and hogs like it and take it readily when it is given to them.

Read what Mr. Dodge says:
Rochester, Minn. Jan. 17, 1923.
I feel that it is my duty to write you and let you know how I am getting along since I treated my cows with your remedy.
I believe it was the fore part of August that I gave your remedy to my entire herd. Before treating them I had lost several calves; since that time conditions have changed. One come today, which makes ten calves and in every case the afterbirth came away in a short time. I have three more to calve soon, but shall lose no sleep, as I believe the trouble is over.
I never saw any medicine that is so easy to give as your remedy. I gave the medicine according to directions and the second morning the cattle were running in every direction to get in the barn to get their share. And another good thing about it is that a person doesn't have to spend a lot of extra time and labor. Just giving the medicine does the job. Will write you later.
ELMER E. DODGE.

Write Today for Bowman's Bulletin

It is FREE. Gives full information about Contagious Abortion and how to eradicate it, as well as the experience of many farmers who have used Bowman's Remedy. A postal sent today will bring you a copy by return mail.

IMPORTANCE OF EARLY HATCHING

IN order to keep chickens profitable it is of prime importance that at least part of the pullets each year are hatched early. The early hatched pullets are the most profitable from every standpoint. The early hatched cockerels are also the most profitable.

Too few people appreciate the importance of early hatching. The following winter they would like to get winter eggs, when they command a high price, but they are not willing to prepare for it in time. It is a great mistake not to practice early hatching. It will be noticed that early hatching is growing more and more important all the time.

One reason early hatching is very profitable is because this automatically necessitates hatching from the best in the flock. The good layers are laying at that time of the year. The poor layers are not laying, and hence all the chicks hatched early as a rule come from the best laying flock. This is in itself a great advantage. The hen that is laying in January and February is a good winter layer, hence hatching at that time necessitates hatching eggs laid at that time of the year by hens that are laying at that time of the year. Early hatching automatically culls the poor layers from the flock, especially if practices for a series of ten years or more.

Often the question is asked, "What is the best way to get winter layers?" We can only say, "Hatch in the winted time." It is easier to get eggs from pullets that come from hens that can lay in the winter time. It is no secret to get plenty of winter eggs, but it is necessary to make plans now. Those plans are to get a flock of early hatched pullets. February is not too early to hatch a large number of pullets. Some of them may go through a partial molt, but if you feed them carefully you will get a good and profitable egg-production before they do that. The trouble with too many people is that they expect a good winter egg-production from hens. It is a fact that winter egg-production can be profitably realized from pullets. Many people keep hens until they are three or four years old and expect a good winter egg-production. From the egg-production standpoint, after a hen has passed the three-year-old period, she has passed her time of usefulness. It is a fact that as a general rule, from the market egg-production standpoint, it seldom pays to keep a hen longer than two years. There are, of course exceptions to this rule, and they are that the exceptional good layer may be kept a year longer.

Another very good reason for practicing early hatching, is that the early hatched chicks are the strongest and the easiest to raise. We have found this to be true year after year. At this writing we have close to 4000 chicks in our brooder houses. All are doing fine, appear healthy and strong. It stands to reason that the hen is in a better physical condition early in the year before she has had time to drain her body of vitality, by heavy laying for a long time. The egg produced in January contains a healthier and stronger germ than the egg laid in May or June. Every time a hen lays an agg she reduces the vitality in her system. For this reason the early chick is much stronger and therefore much easier to raise than the late hatched chick. In spite of the fact that the early hatched chick may encounter more severe weather it will outgrow and outlive the late chick. It is also a fact that we sometimes have

BOWERS Colony Brooder

More Chicks---Less Cost

This brooder is a chick-saver and a money maker. It raises more and better chicks, at less cost than other brooders. Stove is best in the world to hold fire—air-tight and self-regulating. It burns soft coal—the cheapest brooder fuel—perfectly. Cuts fuel costs in half. Stove will also burn hard coal, wood, coke, etc. Regulator maintains even heat night and day. No trouble. Sizes for 500 or 1000 chicks. Low priced Write TODAY.

more pleasant weather for raising chicks in February and March than in April or May. This year, so far, we have had very beautiful weather for raising early hatched chicks, although by the time this article gets into print it may no longer be true. Nobody can tell about Texas weather, therefore, it is just as well to go ahead and make plans and ignore the weather entirely.

In raising chicks it must be remembered that we get as many cockerels as pullets as a general rule. For this reason they are an important factor to consider. The early hatched cockerel can be sold as a small broiler, and then must be sold in the majority of cases at an actual loss. Last year we sold our early hatched cockerels at the farm at 75 cents each when they weighed about one pound each and less. The late hatched cockerels we delivered at 35 cents each when they weighed about one and a half pounds each. The late hatched cockerels we produced and sold at an actual loss. That seems to be true in the majority of cases. The early hatched broiler is a rare article, and therefore commands the price. The late hatched cockerels come on the market when every farmer is selling young chickens on the market, and hence the low price. We believe that from the standpoint of profitable marketing of the early hatched cockerel alone we can afford to bring off our chicks early rather than late.

We have always noticed that the early hatched chicks grow better, faster and, when mature, are larger and better developed. The early hatched pullets in the small breeds will easily average at least a pound heavier than the late hatched pullets among the small breeds like the Leghorns. Among the medium weight breeds the pullets will average close to a pound heavier than the late hatched pullets. This is an important consideration. If your stock is running small practice early hatching.

Matures for Fall Fairs

The early hatched pullets and cockerels will mature in time to be in excellent show condition during the fall fairs and poultry shows. If you are planning on showing at any of these shows or fairs, it is absolutely necessary to hatch some of your chicks not later than February. We have found it wise to hatch out a number in January, February and March. This insures some individuals that will be in fit condition to show the entire fall. We know of some breeders that get a good number of chicks hatched in December. The early chicks will win in the early shows, where the late chicks have no chance whatever. Early hatching is the secret of getting birds in good condition for the fall and early winter fairs and shows. A pullet or cockerel is in the best show condition when she is getting ready to lay her first egg.

It certainly is a fact that the early hatched chicks get a good start, and therefore are better able to stand the hot weather when it comes. Cold weather is better for chicks than hot weather. For this reason the mortality in early hatched chicks as a rule is less than half that of the late hatched chicks. The excessive heat and the greater number of lice and mites are a serious worry to the late hatched chicks and, therefore, they seldom do as well as early hatched chicks.

SPRING WORK IN POULTRY YARD

AFTER being more or less closely housed for the greater part of the winter, chickens often are bothered with insect pests, not to mention that yards and runs may have become foul. In addition to this, unless great care has been observed in managing the flock, the hens may have low vitality—little power to resist the beginning of any disease.

If nothing has heretofore been done to get the flock to working on a business basis, now is the time to commence. It has been proved that few other departments of farm work will pay better than poultry when rightly managed, and a resolution made now that you are going to get your share of poultry profits will help greatly.

Beginning with the house, clean it up thoroughly the first warm

days that come. It may take two or three days to do it properly, and may discommode the flock, but it is worth it. If it appears to be very dirty, or if insect pests are numerous, perhaps the best thing is to scald the house from top to bottom, and not allow the poultry in it again until it has dried. While you are about it, it is as well to whitewash it inside and out. The lime in whitewash greatly discourages the spread of both insects and disease, not to mention the fact that it makes the houses look better and gives an added attraction to the work of the poultry. The coops should also be given some whitewash. The best whitewash is made from the Government formula, as follows: Slack a half-bushel of lime with boiling water, covering during the process. Dissolve a peck of salt in water. Boil three pounds of ground rice to a paste. Dissolve a pound of joiner's glue in water. All these added together while the lime is still hot, and then a half pound of Spanish whiting added, to the whole is added five gallons of hot water, and the whole is set aside, covered, for a few days. To use, stir it up well and apply while hot, heating in any convenient manner.

Of course, all old nesting material should be burned now and new material used. It is not so essential to cleanup the yards and runs if the flock is allowed the freedom of the farm, but if any part of the flock, including chicks, is to be kept close in, the yard must be clean. A common ailment of poultry is gapes, and this is almost invariably caused by a filthy yard. It may look alright when raked up, but it is not if it has been constantly used for a long time. If you have an earth floor in any of your houses, pens, or sheds, sprinkle lime freely upon it. The yards and runs can be treated in a different manner, as you can get to them to clean them. My plan is to put down a little lime over the yard, and then plow it up. You will be surprised at the number of worms in the soil. Probably a great percentage of these are gape worms. They stick in the throat of the chickens when swallowed, and cause gapes when the chickens make an effort to dislodge them. For this reason, it is best to exclude the flock from the yards or runs for at least one day when you plow. After plowing, put down a little more lime and rake it off. These gape worms can exist in a soil that is covered with a grass sod just as well as in bare soil, so do not think the soil is free of them just because the grass is growing thickly. However, where the grass grows well you can usually be sure there is not a large flock to keep the soil very dirty.

Just remember you want setting eggs in large numbers. You can get the eggs all right, but I found it pays to get the hens in fine condition before setting their eggs. The eggs may be fertile, yet not hatch because of the low vitality of the hen that laid it. In this connection, however, it has been my experience that it is best to change rations for the hens very gradually. And if you can select a pen of hens that are not exhausted by winter laying you will get better hatching eggs, especially if the older, tried hens thus selected are mated with a young, vigorous cockerel that has inherent in himself the qualities you want to keep up in your flock.

BAD HABITS OF HENS

EGG eating hens usually form this habit because of lack of lime or meat food in their ration. The taste is most often acquired in the winter when meat food is scarce and when eggs are apt to be frozen and broken in the nests. One egg-eating hen will soon teach others the trick.

Egg-eating hens can be cured by baiting the eggs with ground mustard or strong pepper or powdered aloes.

Prevent further trouble by better feeding. Give all the oyster shell, meat meal, table scraps, and green food they will eat.

Feather Pulling—This habit is worse during the spring, it often results from confining active fowls. It is caused by lack of meat food or by lack of grit, or by irritation from lice and mites.

Feather-pulling hens prefer young, succulent feathers, whose quills are full of blood.

In case of valuable exhibition birds, smear the feathers with lard or vaseline mixed with powdered aloes.

If egg-eating and feather-pulling hens can't be reformed, use them for Sunday dinners.

Hens given free range are not apt to form these bad habits.

HOW TO DETERMINE GOOD AND POOR LAYERS

CULLING as a means of increasing egg production is given especial attention in the United States Department of Agriculture Poultry Exhibit. One lot of 12 hens is shown, which was not culled, and which in one year ate 900 pounds of feed costing $20.70; the 12 hens laid 100 dozen eggs. Contrasted with this loss is one of 8 hens which were culled and which laid the same number of eggs, but ate only 600 pounds of feed at a cost of $13.50. The lot of 12 hens that was not culled ate 50 per cent more feed than the lot that was culled and produced no more eggs. The extra cost of feed, is but one of the larger costs. Others are the extra labor, extra housing room, and extra capital invested.

To enable the poultrymen to cull his hens properly, the exhibit gives the points to be looked for when determining a poor layer, or a good layer. The outlines are as follows:

How to Determine a Poor Layer

Comb—Shrunken, dull and whitish scales.

Eye—Sunken, dull and listless.

Beak—Deep yellow (on yellow-shanked breeds).

Shank—Deep yellow (on yellow-shanked breeds).

Pelvic bones—Thick, rigid, close together.

Abdomen—Rather hard and shallow from pelvic bones to end of keel.

Vent—Small, puckered, dry.

A poor producer moults early, in July and August.

How to Determine a Good Layer

Comb—Full, bright, red, waxy.

Eye—Bright, prominent, alert.

Beak—Pale or white (on yellow-shanked breeds).

Shanks—Pale or white (on yellow shanked breeds).

Pelvic bones—Thin, flexible, wide apart.

Abdomen—Flexible and deep, as measured from end of keel to pelvic bones.

Vent—Large, expanded, moist.

A good producer molts late, in September and October.

HENS STOP LAYING

Can you tell me why my hens stop laying? They look good and feel good. They get scratch feed containing corn, wheat, and buckwheat, plenty of buttermilk but no eggs. The pullets were laying but they stopped also.—H. H. J., Old M[illegible], Michigan.

—[illegible] and pullets frequently stop laying at this season is due to faulty nutrition. Very frequently the early hatched pullets will produce two or three dozen eggs and suddenly go into a hackle or complete body moult. This moulting condition is generally induced by either poor breeding. or faulty management, and more especially faulty nutrition. If the birds are not properly fed and are in production they will invariably lose weight. Loss of weight is almost a certain indication that production will drop. The birds will go into a slightly off condition which will be immediately followed by a moult. One of the problems is to develop more rugged stock that carries more weight and greater resistance to disease.—E. C. Foreman, Associate Professor of Poultry Husbandry, M. A. C.

CAN USE PULLETS EGGS FOR HATCHING

Kindly advise me if pullets eggs will be strong enough for hatching. They are large Barred Rocks.—Mrs. R. J. A., Owosso, Michigan.

—We do not usually get quite as strong chicks from pullet eggs as from eggs laid by older birds, we very frequently use them for breeding purposes, particularly if they are well matured strong pullets from which we are anxious to get some stock.—Clarence M. Fergerson, Dept. of Poultry Husbandry, M. A. C.

HIGHEST QUALITY CHICKS

Michigan's Old Reliable Hatchery
(The most modern and best equipped Hatchery in the state)

PURE BRED English and American S. C. W. Leghorns; S. C. Anconas; Barred Plymouth Rocks and R. I. Reds. Strong, well hatched chicks from tested Hoganized Free range stock that make wonderful winter layers.

CHICKEN AND EGG VALUES LOWER LAST YEAR

THE combined farm value of chickens raised and eggs produced in 1922 is estimated at $854,207,000, by the United States Department of Agriculture. The value in 1921 was $900,820,000.

About 543,000,000 chickens were raised on farms in 1922, with a farm value of $354,199,000, as compared with 510,000,000 chickens raised in 1921 valued at $362,253,000. Egg production totaled 1,962,356,000 dozen eggs with a value of $538,567,000 in 1921.

Of the chicken eggs produced in 1922, large quantities were consumed in industries in the manufacture of other than food products, and about 113,000,000 dozen were used to produce chickens, the department says.

The average farm price of chickens raised in 1922 was 65c per fowl, compared with 71 cents in 1921, and with 86½c in 1920. The average farm price of chicken eggs was 25.5 cents a dozen in 1922, compared with 29.3 cents per dozen in 1921 and with 44.4 cents in 1920.

It is estimated that there were 412,000,000 chickens on farms January 1, 1922, a time of year when the number of chicks is low. There were 386,000,000 chickens on farms January 1, 1921, and January 1, 1920, there were 360,000,000, according to census figures.

SOME HEN!

THE daily press reports that a man living in Sharpetown, Maryland, has a hen that taps on the door at 11 a. m., each day. When admitted, it walks to a rocking chair, hops up, lays an egg, and then hurries to the door to be let out. If her pecking on the door on arrival brings no response she flies to the window to attract attention.

Some hen! we say. Take this out to the chicken house and read it to the hens. Maybe after hearing this, your flock will decide to follow her example. Then all you will have to do is to teach them to lay their eggs in a basket instead of the rocking chair and your nest-finding and egg-gathering troubles are over. You can hire someone to stand outside the door to regulate the traffic and keep the hens in line. Then when the basket becomes full you can set it aside and place another. Or maybe you can teach them to lay the eggs right in the crate and save handling over. It might be worth trying. If you do try this on your hens let us know how you come out.

GOVERNMENT BULLETINS OF INTEREST IN MARCH

A SMALL list of Farmers' Bulletins and Circulars of general interest during March is believed to be of value to our readers. Copies may be obtained free by addressing the Division of Publications, United States Department of Agriculture, Washington, D. C. Specify the number and name and whether Farmers Bulletin or Department Circular.

Farmers' Bulletin 181, Pruning; 206, Milk Fever: Its Simple and Successful Treatment; 440, Spraying Peaches for the Control of Brown Rot and Curculio; 597, Road Drag and How Used; 609, Bird Houses and How to Build Them; 639, Eradication of Cattle Tick in Dairying; 766, The Common Cabbage Worm; 863, Irrigation of Grain; 947, Care and Repair of Mowers, Reapers, and Binders; 961, Transferring Bees to Modern Hives; 979, Preparation of Strawberries for Market; 1017, Cattle Scab and Methods of Control; 1045, Laying Out Field for Tractor Plowing; 1150, Parasites and Parasitic Diseases of Sheep, 1175, Better Seed Corn; 1176, Root, Stalk, and Ear Rot Diseases of Corn; 1181, Raising Sheep on Temporary Pastures; 1185, Spraying for the Alfalfa Weevil; 1189, The Handling of Spinach for Long Distance Shipment; 1211, Home Canning of Fruits and Vegetables; 1220, Apple-Orchard Renovation. Department Circular 214, Fusarium Tuber Rot of Potatoes.

Rheumatism
A Remarkable Home Treatment Given by One Who Had It

In the year 1893 I was attacked by Muscular and Sub-Acute Rheumatism. I suffered as only those who are thus afflicted know for over three years. I tried remedy after remedy, but such relief as I obtained was only temporary. Finally, I found a treatment that cured me completely and such a pitiful condition has never returned. I have given it to a number who were terribly afflicted, even bedridden, some of them seventy to eighty years old, and the results were the same as in my own case.

I want every sufferer from any form of muscular and sub-acute (swelling at the joints) rheumatism, to try the great value of my improved "Home Treatment" for its remarkable healing power. Don't send a cent; simply mail your name and address, and I will send it free to try. After you have used it, and it has proven itself to be that long-looked for means of getting rid of such forms of rheumatism, you may send the price of it, One Dollar, but understand I do not want your money unless you are perfectly satisfied to send it. Isn't that fair? Why suffer any longer, when relief is thus offered you free. Don't delay. Write today.

MARK H. JACKSON
265J Durston Bldg., Syracuse, N. Y.
Mr. Jackson is responsible. Above statement true.

MARKET FLASHES

MARKET SUMMARY

All grains are quiet after decline on opening of week. Beans unchanged. Potatoes firm. Butter and eggs inactive. Receipts of poultry exceed demand and prices decline. Demand for dressed calves good but hogs not wanted. Cattle active to steady. Hogs active but prices lower. Small demand for sheep. Provisions easy.

(Note: The above summarized information was received **AFTER** the balance of the market page was set in type. It contains last minute information up to within one-half hour of going to press.—Editor.)

FOOTE'S MARKET LETTER

By W. W. Foote

OUR Michigan farmers, in common with those of adjoining states, who are so situated financially as to require no assistance from the banks have no cause for complaint, even if affairs abroad are uncertain and extremely unsatisfactory; while farmers are requiring money to tide them over for a short period are told by their county bankers that they are prepared to furnish funds to meet their needs. It may be said truthfully that the financial problem has been settled so far at least as where the farmer is solvent and producing average crops. It is especially cheering that banks stand ready to loan money to farmers who desire to purchase live stock for feeding purposes. Rates of interest are much lower than during the war or a year ago, and the Chicago banks are making loans on collateral at 4¾ to 5¼ per cent. Bank deposits are much larger in farming districts generally than a year ago, and bankers are giving legitimate borrowers the preference over speculators except in some instances in the leading cities. A world of grain is being converted into beef and pork products, and flocks of sheep are getting their full share, for live mutton sells so exceptionally high that owners realize the importance of giving them the best care. Just now the big markets are largely supplied with lambs fed in Colorado, for which very high prices are paid, lamb and mutton being a luxury, but Michigan and Ohio are doing their share in the production of mutton and wool. The consumption of wool and the stocks of wool are now nearly as large as before the war, and more domestic wool is being consumed than at that period. Sheepmen now have but one cause for dissatisfaction, and that is the fierce discrimination made by the packers against lambs of heavy weight, the public have been long accustomed to eating lamb chops, although in England heavy chops have the preference. Many farmers are still showing their faith in the production of beef, and more feeders have been shipped from cattle markets than a year ago, although beef cattle have declined in value in recent months. Hog feeding goes on actively, although huge marketings have made lower prices.

The Grain Markets

Grain is still exported to European war countries, even to Germany to a fair extent, but quite recently our exports have undergone a decided falling off. A striking feature of this foreign trade in our surplus grain is the steadily large rye shipments, this cereal being much cheaper than wheat and much desired for making bread. Much less corn is exported than a year ago, nor are the exports of oats on a large scale. Wheat is bringing good prices, and after sharp breaks rallies have taken place, but prices are much lower than a year ago. Corn is being fed very extensively to live stock, and more oats are being fed on farms than usual because of their cheapness. The visible wheat supply in this country is smaller than it was last year, while the rye supply in sight amounts to 12,946,000 bushels, comparing with 7,273,000 bushels a year ago. The visible oat supply is 30,266,000 bushels, comparing with 67,857,000 bushels a year ago. The corn in sight is much less than a year ago, although ample. The Department of Agriculture states that the exports from this country to Germany are mostly paid for in foreign currencies, and only in rare instances is credit extended to a German buyer. May wheat has been selling in the Chicago market around $1.19, comparing with $1.44¾ a year ago; May corn at 75 cents, comparing with 66 cents last year; May oats at 45½ cents, comparing with 41¾ cents last year; and May rye at 87 cents, comparing with 98 cents a year ago.

The Cattle Market

One of the signs of the times is the marked falling off in the demand for stocker and feeder cattle in Chicago and other western markets to ship to feeding districts in the surrounding territory, for desirable offerings have sold relatively higher than beef cattle of quality. Common cattle can still be bought at low prices it is true, but experienced stockmen have demonstrated that feeding inferior stock is not likely to pay, particularly when the price of corn is high. Of late the demand has centered in well-bred steers suitable for making choice beef, and some sales were made at $8 per 100 pounds and over, with most sales at $6.50 to $7.75.

Most stockmen in preparing cattle for the market are practicing short feeding, and very few beeves that class as choice are arriving in packing points. The bulk of the cattle offered on the Chicago market sell far below the top figures, steers that sell at $10 and over cutting very little figure. Steers are bought by the packers largely at $7.75 to $9.75, with the best at $10.25 and common lots at $6.25 to $7.50. A year ago the top was $10.90.

Hog Feeding Popular

A few months ago the United States Department of Agriculture announced that many more cattle, hogs, and sheep were held in feeding districts than a year earlier, and the receipts of cattle and hogs have demonstrated the truth of this by showing big gains over recent years, but such gains are not shown by the marketing of sheep. As was anticipated early in the winter packing seasons, there has been steadily increasing marketing of hogs, and the predicted large decline in their prices has taken place, as owners have become panic-stricken and hurried so many swine to market that it was out of the question to dispose of them without putting prices materially lower. For a long period heavy hogs greatly predominated in the western markets, causing their sale at a big discount from prices paid for light hogs, but within a short time more of the light weights have been marketed, the higher prices for corn being one of the reasons for shortening the feeding time. Meanwhile the home consumption of fresh and cured hog products has been extremely large, while in spite of the political complications across the Atlantic, our exports of lard and cured hog meats have been running for larger in volume than a year ago. The spread in hog prices has narrowed considerably, and while prime light bacon hogs still top the market, they sell at a smaller premium over the best heavy butchers than a few weeks ago. Late sales were made of hogs at $6.65 to $8.25, comparing with $9 to $10.90 a year ago.

Heavy Lambs at a Discount

As happens every year, heavy Colorado lambs are discriminated against severely by buyers, although sellers contend that heavy chops and roasts are sold in the butcher shops at the same prices as those asked for light weights. Killers greatly prefer lambs weighing from 80 pounds down, while the lambs marketed weigh largely from 85 to 90 pounds and have to be sold for 50 cents to $1 discount. Extremely few feeding lambs are coming on the Chicago market, and because of their scarcity they have been selling higher in some instances than prime killers. The Colorado lambs are being marketed freely, with Chicago getting its share, and it is stated that about 25 per cent of these youngsters have gone to market. Our Michigan farmers do not need any advice on the sheep industry, for they know that it is one of the most successful of farm industries, and they are not going to abandon it, although it does not follow that they are going to pay fancy prices for thin feeding lambs. It is quite likely that some of these feeders will make some money for their owners, but there is such a thing as paying too much at the start. On a late Monday a Michigan stockman bought in the Chicago market 300 head of choice 70-pound feeder lambs at $15.40, but larger sales have been made at $14.50 to $14.75. Recent lamb sales took place at $12.50 to $15.40.

WHEAT

Prices in the wheat market declined during the past fortnight and the trading was dull. The Chicago feeling is that the market for wheat is weak and belief is general that dealers in that market are nearly all on the short side of the market. Outside dealers are long and are carrying all the grains. Stocks of wheat are heavy and the supply will prove more than enough if some way is not found by which Europe will be enabled to purchase the American surplus. The Ruhr trouble is believed to be the cause of the slow European buying and bulls are anxious that something be done that will bring this tangle to a satisfactory finish. Those who expect an early settlement are bulls and those who look at the supply and demand situation by itself are bears. It appears that dealers are heavily short and commission houses in Chicago are advising customers to avoid the short side, fearing that the bears may be forced to cover. The general outlook is considered bearish because of abundant supplies and lack of export buying. Very little American wheat is going out of the country and there is scarcely and fresh buying by foreigners. Reports were around last week that two or three European countries were going to buy a large quantity of American wheat before the week closed but these proved to be only rumors; however, grain is going out of the country as exports last week amounted to 4,351,000 bushels compared with 3,688,000 bushels for the previous week.

Prices

Detroit—Cash No. 2 red, $1.35; No. 2 white, $1.35; No. 2 mixed, $1.33.

Chicago—No. 2 hard, $1.18½.

New York—No. 2 hard, $1.27½.

Prices one year ago—Detroit, No. 2 red, $1.40; No. 2 white, $1.37; No. 2 mixed, $1.37.

CORN

Trading in the corn market has been inactive and the tone easy. Many dealers sold out of corn because of the declines in wheat prices. There were bulls in the market who came out from time to time to support the market and losses were only moderate. Receipts are smaller than they have been and farmers seem to be inclined to hold their corn at prevailing prices. Export trade has been fair. Reports show that 1,177,000 bushels were exported last week or 2,000,000 bushels more than the previous week. Receipts at Chicago last week aggregated 3,722,000 bushels and shipments were 1,117,000 bushels. This market has many friends who believe higher prices will come in spite of the dull fortnight the market has just passed through. We are inclined to take a bullish stand and expect prices to advance.

Prices

Detroit—Cash No. 2 yellow, 79c; No. 3, 77c; No. 4, 75c; No. 5, 73c.

Chicago—No. 2 yellow, 71¾@72½c.

New York—No. 2 yellow, and No. 2 white, 90½c.

Prices one year ago—Detroit, No. 2 yellow, 66½c; No. 3, 64½c.

OATS

Oats followed other grains. The market firmed up on the close of last week but values did not change. Receipts showed a decrease and demand was unchanged. The larger markets of the country received about the same amount of grain as they did a year ago and they expect to receive less this week as country offerings are practically nothing. Oats will continue to follow other grains.

Prices

Detroit—Cash No. 2 white, 49½c; No. 3, 48c; No. 4, 46½c.

Chicago—Cash No. 2 white, 44@45c; No. 3, 42¾@44c.

New York—Cash No. 2 white, 55½c.

Prices one year ago—Detroit, Cash No. 2 white, 42c; No. 3, 39⅛c.

RYE

Rye looks weak at the present time and trading is quiet with prices steady. The price has declined slightly but such facts as can be secured on this market indicate this grain will advance.

Prices

Detroit—Cash No. 2, 87c.

Chicago—Cash No. 2, 83¼@84c.

Prices one year ago—Detroit, Cash No. 2, $1.05.

BEANS

The bean market finished last week with an easy tone and a decline of 10c per cwt. at Detroit, but the price is still above that quoted in our last issue. Demand fell off some the fore part of February but since that time buying has been more satisfactory. Students of the market declare that all the factors concerning this product lead one to believe that beans will rule from firm to stronger, with slight declines from time to time from now until the new crop. Regarding the future trend of this market the Bean and Pea Journal states:

"The main reason for belief in higher prices—not so much higher, but some—is the quantity of beans on hand at this time in comparison with former years. Michigan and California are the only two producing states with any considerable quantity of beans on hand. At the present rate of consumption, these stocks will all be gone by new crop. Oriental beans are coming in to some extent, but they can be absorbed easily and scarcely affect the domestic market. Beans from the Danubian states and other producing districts also are finding their way to the states, but the same holds true of them."

Prices

Detroit—C. H. P., $7.80 per cwt.

Chicago—C. H. P., $8.15@8.50 per cwt.

Prices ane year ago—Detroit, C. H. P., $6.35 per cwt.

POTATOES

Cold weather during the past couple of weeks has caused a decrease in receipts and the market has become firm. Demand is slow and only the better grades are moving. Cars are still scarce and not much relief is expected before warm weather when box cars can be used for getting the potatoes to market.

Last week Grand Rapids hotels, high class cafes and the more particular consumers were paying 10c per pound for Idaho baking spuds while growers a few miles from Grand Rapids were getting around 40c per cwt. for their best stock. A prominent Chicago potato dealer says its the color and the Potato Growers' Exchange say it is the grade. The Chicago dealer believes that the farmer in this state should raise white potatoes instead of russets but the potato men of Michigan state that if the potato growers will observe more closely the rules of production and marketing, grading their product more carefully, they can get

WINDMILLS! 45 YEARS OLD

Mr. B. A. Constable of Indiana, writes that he is watering 100 head of stock with a Perkins Windmill that has been on the job since 1877.

PERKINS WIND MILLS

A silent, powerful steel mill—Hyatt Roller Bearing equipped. Blades are heavily reinforced with outside and inside bands. Has automatic safety regulator. Pumps in faintest breeze. Quite, durable, and dependable.

Grease only once in two years. Large, easily filled grease reservoirs keep working parts perfectly lubricated.

the Michigan tuber back on a price level with other producing centers. Commission merchants are expecting an improved demand at western markets within the near future.

Prices

Detroit—Michigan, $1.07@$1.13 per cwt.

Chicago—Wisconsin round white, 90c@$1.05 per cwt.

New York—Michigan, $1.27@1.38 per cwt.

Prices one year ago—Detroit, $2.08 per cwt.

HAY

Hay markets generally are steady to firm with prices showing little change from a week ago. Country loadings are reported very small on account of storm conditions at many shipping points. Receipts are therefore only fair and markets show more strength in consequence.

Prices

Detroit—No. 1 timothy, $16@16.50; standard, $15.50@16; light mixed, $15.50 @16; No. 2 timothy, $14@15; No. 1 clover mixed, $13 @14; No. 1 clover, $13@14.

Chicago—No. 1 timothy, $19@21; No. 2 timothy, $15@17; No. 1 light clover mixed, $17@18; No. 1 clover, $12@14.

New York—No. 1 timothy, $25; No. 2 timothy, $24; No. 1 light clover mixed, $25; No. 2, $23@24.

Prices one year ago—Detroit, No. 1 timothy, $19@20; standard, $18 @19; No. 2 timothy, $17@18.

Chicago—Alfalfa, No. 1 and choice, $24@27; No. 2 and standard, $17@21.

WOOL

Quieter European markets, less activity in the west and a more waiting attitude in eastern centers have resulted in taking the edge off wool trading in the midwest, with many operators feeling that prices have reached their peak. The tone is still firm, however, with no recessions from the top price levels, and with fair amounts of the various grades of wool moving.

MISCELLANEOUS MARKET QUOTATIONS

Detroit, Tuesday, February 27.

BUTTER—Best creamery, in tubs, 50@51c per lb.

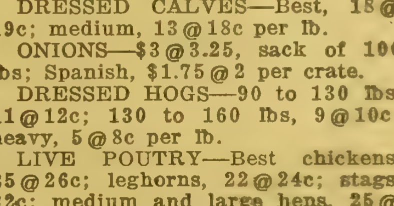
Sheep pelts, 50@$1.50; No. 2 hides 1c under No. 1, calf and kip 1½c under No. 1.



Week of March 4

FOR the week as a whole temperatures will average below normal and precipitation above.

Michigan temperatures will be on the upward trend as this week begins continuing until about Thursday or Friday when a maximum of about 44 degrees will be reached. These figures are based from central Western Michigan; counties to north and east will be lower while those to the south and east will be the same or a little higher. Temperatures will fall suddenly near the close of the week but rise again the next day.

Tuesday will be unsettled if not actually stormy on or immediately after the middle of week there will be an increase in wind, rain or snow. These conditions will continue thru the rest of the week with storm damage more or less certain in various sections.

Week of March 11

Cold, fair weather and with temperatures more or less steady are the conditions expected during opening days of this week. For the last half readings will continue lower each day reaching a minimum about Friday.

Centering on about the 15th, Michigan will experience rain, sleet or snow and gales. By end of week the sky will clear and temperatures reach moderately cold readings but rapidly begin rising. In fact, conditions are such as to bring on a decided warm wave at the end of this or beginning of next week. Maximum temperatures of about 50 degrees will occur in central and southern Michigan at this time.

With the warm temperatures will be some severe local storms of wind, rain or hail. Heavy local rains, if not cloud bursts, are probable although the greatest damage will most likely be from wind.

This predicted warm spell will not mark a record for Michigan March warmth nor will the cold to follow next week constitute a record but we believe the change will be rapid and marked enough to cause inconvenience to many.

IF YOU CAN RAISE TON OF PORK FROM LITTER

(Continued from page 3.)

bers may nominate any litter or litters of pigs farrowed on their farms between March 1 and May 15 for an award. 2. Litters must be nominated at the time of inspection on the special blank provided for this purpose. 3. Nominations must be certified by the committee on inspection and forwarded by this committee through the county agent to the state leader of the club immediately after inspection.

Official Weights of Litters—1. Litters shall be weighed on the day they are 180 days old, if possible. If this is not possible they may be weighed any time within three days preceeding or following this date. The gain for the intervening days shall be pro-rated at the average daily gain made by the litter since birth and added to or subtracted from the scale weight. 2. Litters shall be weighed by a committee of two or more disinterested farmers, representing the swine or general agricultural interests of the county or township. 3. Reports on weights and the eligibility of litters to an award shall be certified by the committee on weighing on the special blanks provided for this purpose, and forwarded through the county agent to the state leader of the club immediately after weighing.

Basis of Awards—1. Only one prize shall be awarded to a member. 2. Awards shall be made on the basis of the weight of the litter as herein provided, but no award will be made unless all the requirements set forth under memorandum of rations, earmarking of litters, inspection of herds, nomination of litters and official weights are complied with fully and correctly. 3. Awards shall be made by the executive committee of the Michigan Ton Litter Club, under the conditions outlined in the paragraph above. 4. Prizes shall be presented at the annual meeting of the Michigan Swine Breeders' Association.

Officers of the Club—1. The officers of the Michigan Ton Litter Club for 1923 shall consist of the Presidents of the various Swine Breeders' Associations of the State, namely: W. E. Livingston, Parma, Michigan, of the Michigan Poland China Swine Breeders' Association; F. W. Alexander, Vassar, Michigan, of the Michigan Chester White Swine Breeders' Association; O. F. Foster, Pavilion, Michigan, of the Michigan Duroc Jersey Swine Breeders' Association, and Lloyd Aseltine, Okemos, Michigan, of the Michigan Hampshire Swine Breeders' Association, with V. A. Freeman, Michigan Agricultural College Extension Specialist in Animal Husbandry, East Lansing, Michigan, acting as State Leader of the Club.

Deaf Can Hear Says Science

New Invention Aids Thousands

Here's good news for all who suffer from deafness. The Dictagraph Products Corporation announces the perfection of a remarkable device which has enabled thousands of deaf persons to hear as well as ever. The makers of this wonderful device say it is too much to expect you to believe this, so they are going to give you a chance to try it at home. They offer to send it by prepaid parcel post on a ten-day free trial. They do not send it C. O. D.—they require no deposit—there is no obligation.

They send it entirely at their own expense and risk. They are making this extraordinary offer well knowing that the magic of this little instrument will so amaze and delight the user that the chances of its being returned are very slight. Thousands have already accepted this offer and report most gratifying results. There's no longer any need that you should endure the mental and physical strain which comes from a constant effort to hear. Now you can mingle with your friends without that feeling of sensitiveness from which all deaf persons suffer. Now you can take your place in the social and business world to which your talents entitle you and from which your affliction has, in a measure, excluded you. Just send your name and address to The Dictograph Products Corporation, Suite 1302Y, 220 W 42nd St., New York, for descriptive literature and request blank.

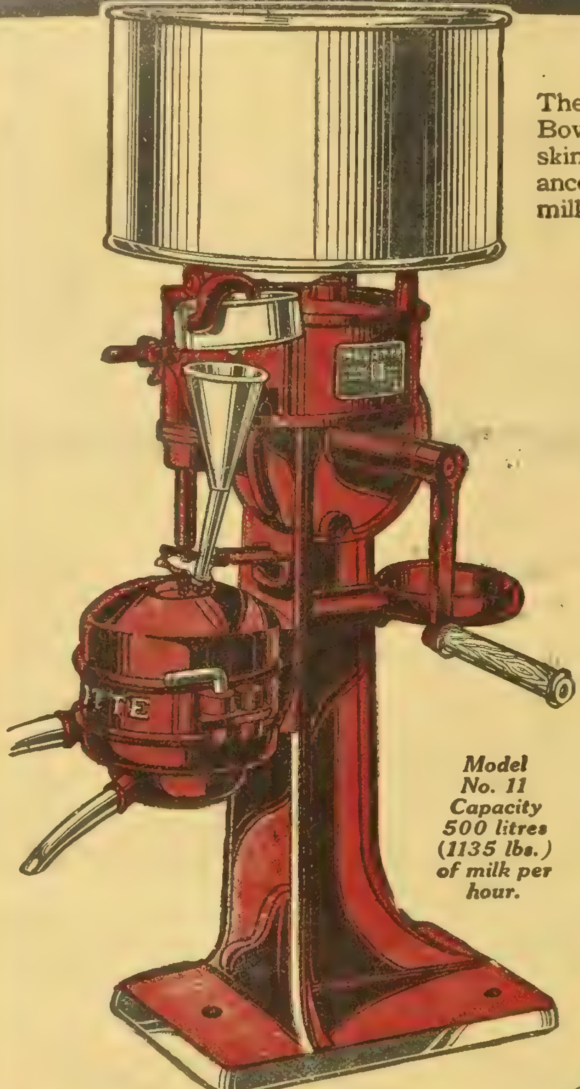
Belgium Melotte
Imported Separator



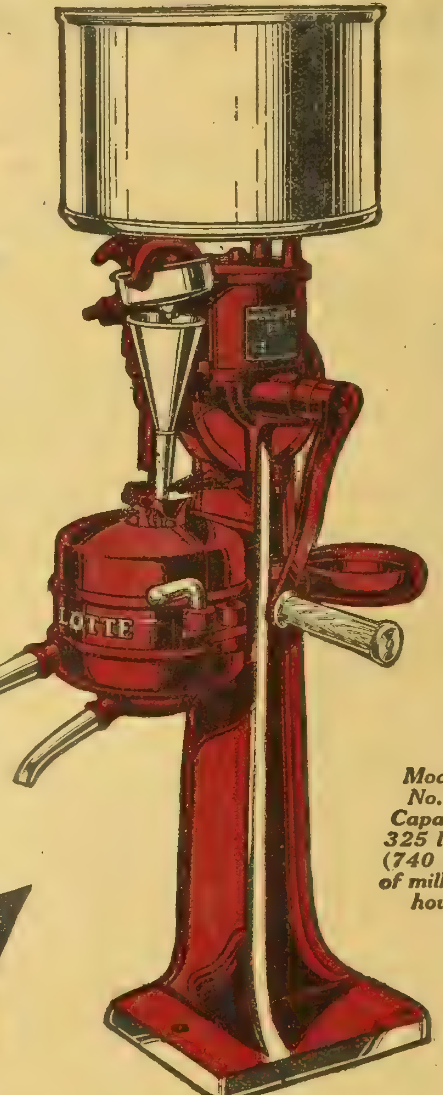
Model No. 11 Capacity 500 litres (1135 lbs.) of milk per hour.

Self-Balancing Bowl

The Belgium Melotte is the only single-bearing-bowl separator ever made. This patent Bowl hangs from one frictionless ball bearing and spins like a top. It is *self-balancing.* It skims as perfectly after 15 years of use as when new. Positively cannot ever get out of balance—cannot vibrate and thus cause cross currents which waste cream by remixing with milk. Send coupon below today. Get the Free Book that tells about this great Melotte.

$7.50 After Trial

We will send an imported Belgium Melotte Cream Separator direct to your farm on 30 days' absolutely Free Trial. Use it just as if it were your own machine. Put it to every possible test. Compare it with any or all others. The Melotte is easy to keep clean and sanitary because it has only one-half the tinware of other separators. Turns so easily that bowl spins 25 minutes after you stop cranking unless brake is applied. No other separator has or needs a brake. After you have tried it for 30 days and you know it is the separator you want to buy, pay $7.50 down and balance in small monthly payments.



Model No. 7 Capacity 325 litres (740 lbs.) of milk per hour

Free Trial

Your choice of any of these three models. NO MONEY DOWN—FREE TRIAL—SMALL MONTHLY PAYMENTS—DUTY FREE. This wonderful Belgium Melotte Separator has been picked by a jury of thousands of farmers—picked by dairy experts throughout the world to be the "king" of all separators ever manufactured. It has broken all records for Efficiency of Skimming, Ease of Turning, Convenience of Operation and Durability. Send coupon below for Big Free Book.

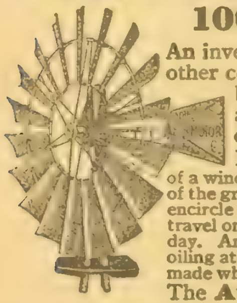
4 TIMES Around the World with ONE OILING
100,000 Miles Without Stopping for Oil



An inventor who could develop an automobile, a railroad car or any other conveyance on wheels which would perform such a feat would be considered a wonder. But such is the record of regular accomplishment by the Auto-oiled Aermotor during the past eight years in pumping water.

Did you ever stop to think how many revolutions the wheel of a windmill makes? If the wheel of an Aermotor should roll along the surface of the ground at the same speed that it makes when pumping water it would encircle the world in 90 days, or would go four times around in a year. It would travel on an average 275 miles per day or about 30 miles per hour for 9 hours each day. An automobile which keeps up that pace day after day needs a thorough oiling at least once a week. Isn't it marvelous, then, that a windmill has been made which will go 50 times as long as the best automobile with one oiling?

The **Auto-oiled Aermotor** after 8 full years of service in every part of the world has proven its ability to run and give the most reliable service with one oiling a year. The double gears, and all moving parts, are entirely enclosed and flooded with oil all the time. It gives more service with less attention than any other piece of machinery on the farm. To get everlasting wind-mill satisfaction buy the Auto-oiled Aermotor, the most efficient windmill that has ever been made.

Current Agricultural News

RIVALRY MUST STOP, LEADING CATTLE BREEDERS AGREE

AT a meeting called in Washington, February 5, by the Chief of the Dairy Division, United States Department of Agriculture, representatives of five dairy cattle breeders associations agreed to make special efforts to suppress destructive rivalry and to work together in every way possible to develop the dairy industry and particularly the purebred dairy cattle business. The breeds represented were the Ayrshire, Brown Swiss, Guernsey, Holstein—Friesian, and Jersey. More than 20 representatives were here from various parts of the country, including the presidents of four of the breed associations and the secretaries of all five.

Resolutions passed at the conference called attention to the need for more widespread testing for production records among breeders of purebred cattle; means of causing a wider distribution of purebred cattle; the recognition in counties and states of superior sires; rules governing sales of purebred cattle; means of lowering the cost of recording animals in herd books; supervision of production records; means of making the showing of cattle at fairs more educational to farmers and other visitors; rules governing public sales; scope of the work of field representatives of breed associations; and other subjects concerning the conduct of breed associations and the furthering of the interests of purebred dairy cattle. The need of more support for tuberculosis eradication by the area method was also emphasized.

BEET GROWERS ASS'N DIRECTORS MEET

A VERY important directors meeting of the Michigan Sugar Beet Growers Association was held February 23rd in Owosso at the Hotel Wildurmuth. The meeting was called to order by President Tom C. Price of Saginaw.

A sworn itimized financial report was presented by General Manager C. E. Ackerman in which it was shown that $2,992.90 came into his hands from the 113 local organizations in the state. The balance, $1,156.72 after all bills were paid. handled directly by him, was turned over to Sec'y-Treas. R. P. Reavey of Caro, Michigan. A great many locals sent their money direct to Sec'y-Treas. Reavey which is not included in the above figures. A complete report will be made in Saginaw to the Growers at their annual meeting which will be called by President Price in the very near future. The recorded membership of the organization is around 10,000 members. Membership fees were $100.00 each one-half of which was to be paid the state organization. Many locals have not as yet remitted their share and on this account the organization is hampered somewhat.

The new 50-50 contract was indorsed unaminously by the directors of the organization and a resolution was passed in which all growers of beets were urged to give the Owosso Sugar Company their acreage for beets on one of their contracts, for beets enough to give them a full capacity run this year. Being the first to recognize the principal of the 50-50 contract and their willingness to meet with this organization and iron out the details of sugar beet contracts all efforts will be made by this organization to assist the agricultural department of this company and any and all other companies that recognize the principal of the 50-50 contract for beets as the Owosso Sugar Company has done.

Mr. C. D. Bell, Sec'y & Gen. Mgr. of the Owosso Sugar Company was present at the meeting and explained their position to the directors in every detail to the utmost satisfaction of the board.

The meeting adjourned amid much feeling of good will and all expressed their desire to do everything possible to co-operate for the general good of the sugar beet industry and will ask all farm organizations and farm papers to also co-operate in making this important step a success and of financial gain to the farmer and all industry connected with the beet industry.

This organization will get out circular letters to every member explaining the new 50-50 contract in a general way and showing its merits and the importance of this great step in Michigan agriculture.

All local beet growers organizations will be asked to co-operate and call meetings at which the state organization will furnish speakers if possible to explain to the growers all the details and answer all questions pertaining to all three of the contracts now offered. Since all banks and all chamber of commerce boards are directly interested in the welfare of the farmer and his welfare they also are asked to co-operate with this organization in their efforts to place great Michigan industry on a little firmer basis.

Since the U. S. imports three-fourths of the sugar it is one of the crops that cannot be over producted easily so long as Europe, where half of this sugar was produced, must devote their acres to producing grain to feed their hungry millions who have not the money to buy our excess crops of wheat, rye, corn, pork and potatoes, at prices that we can afford to raise them. It seems a few acres of beets may be a good investment for the farmer for 1923 and a good cash crop to chance especially since the consumption of sugar is increasing rapidly and also the price is advancing rapidly.—C. E. Ackerman, Manager, Mich. Sugar Beet Growers Ass'n.

MEXICAN TARIFF FAVORS WHEAT IMPORTS

A DEMAND for American wheat is looked for throughout the Saltillo and other Mexican districts following the recent increased duty on imported flour. Flour mills of Saltillo, in spite of the fact that they are located in the heart of Northern Mexico's richest section, have been closed for some time on account of depleted stocks of wheat, says Vice Consul Earl W. Eaton, Saltillo, in a report just received by the Department of Commerce. The mills have not been buying in the United States on account of the hope that the Mexican of four centavos per kilo might be removed, this duty making it impossible for the mills to compete with flour from the United States bearing a Mexican duty of but five centavos per kilo.

U. S. STOCKMEN FACING RIVALS

AMERICAN agricultural interests and farmers can expect real competition from Argentina in the next few years, in the opinion of A. M. McKinstry, vice-president of the International Harvester Co., who has completed an extensive tour of this country and Brazil.

He said he found an increasing demand for North American agricultural machinery in Argentina and felt that, aside from the low ebb in the livestock industry, the farmers here were in as good condition as those in the United States.

"I never saw such splendid Shorthorn cattle," said Mr. McKinstry, discussing his trips to the big Argentina ranches. "They mean that sock raisers in the United States have serious competition. The same is true of the grain that they raise here. The soil in the grain country is similiar to that of Iowa, and the crops are immense. Argentina is developing some splendid farmers. They are coming along rapidly in adopting the most up-to-date farming methods.

"The Argentina corn crop has been quite seriously hurt by the intense heat this summer, and the wheat crop will fall short of early predictions."

EXPORT MARKET FOR U. S. PRODUCTS

Secretary Hoover announced last week that under appropriation made recently by Congress, the Department of Commerce is at once undertaking an exhaustive investigation of all the facts bearing upon the present situation and the outlook of our export market in agricultural products with the cooperation of the Department of Agriculture.

Entered as second-class matter, August 22, 1917, at the post-office at Mt. Clemens, Mich., under act of March 3rd, 1879.

Can We Reduce Taxes, Yet Increase Receipts?

Business Farmer's Correspondents Suggest Many Novel Plans to Answer this Paradox which is Uppermost in Minds of Our Farmers. If You Do Not Agree, Let's Have Your Plan

THE State of Michigan could wipe out debts amounting to $63,500,000 within the next ten years if a four per cent income tax were adopted, as such a tax would yield a sufficient surplus over the amount needed to run the state to accomplish this task.

If the income tax law were drawn in such a manner as to require the reporting of all incomes, large or small, the grand total reported under the law would not be far from two billion dollars in an average year. From this amount would be deducted the personal exemptions allowed. If such exemptions averaged $1,000 for persons reporting, they would amount to about $1,400,000,000. The income subject to the four per cent tax rate in an average year would therefore be around $600,000,000, and the tax thereon would amount to $24,000,000.—David Friday, President of Mich. Agricultural College.

TAXING FARMERS OR TAXING INCOMES

MICHIGAN farmers and wage earners recently helped to defeat an income tax. They are coming to see that they should not have defeated it; sometime they will correct their mistake, and Michigan will have an income tax that will exempt such incomes as those of wage earners and farmers.

A tax on gasoline is now proposed, and some farmers and some wage earners are supporting it. The proposal should be considered a bit carefully. To put a tax on gasoline might be making another mistake that would have to be corrected. Taxing gasoline was a real issue in Nebraska lately. Farmers and wage earners there gave unusual attention to it, and they defeated the tax.

There are three chief sources of mechanical power: steam, electricity and gasoline. Steam and electricity give power for railroads, factories and big business generally. Gasoline is the fuel of the farm engine, the tractor, the truck. Big business almost entirely escapes a gasoline tax. Michigan's power dams would escape it. Railroads would have no gasoline tax to pay. On the contrary the truck would be taxed, and the truck is the railroad's chief competitor, the railroads have good reason for supporting a gasoline tax: it would tend to free the railroads from taxation and to keep trucks from competing with them. The truck has been the farmers' reliance and hope in avoiding high freight rates; a gasoline tax would serve the railroads by handicapping trucks, by helping to put trucks out of business.

More is said about the rich man's automobile than about the farmer's Ford, which also uses gasoline. An income tax would reach the big income and would not touch the farmer's income, but a gasoline tax would be a tax on every trip the Ford makes to town with cream or eggs. Farmers have to go to town now and then, for marketing, for repairs to machinery, or to see a doctor. The car proves cheaper than horses for such trips, and commonly a farmer finds that he has to have a car. In general, the farmer who has no car is hoping to have one. Taxing gasoline is not a help to the farmer; it is taxing his Ford, his tractor, his buzzsaw. To tax the men best able to pay, a gasoline tax is not necessary; an income tax will do the work.

Living far from town is a disadvantage. A gasoline tax makes the disadvantage greater; the farmer who has ten miles to go must pay five times the tax paid by the farmer who has two miles to go. It is an unfair tax, not a tax proportioned to ability to pay.

A gasoline tax is a sales tax, and a sales tax is wrong in principle; it is a tax on the consumer, the man least able to pay. Organized farmers and organized labor have thought the subject through, and national organizations are positively on record against sales taxes. They have defeated sales tax proposals in Washington.

Sales taxes are no new thing. They were tried out in Egypt and Babylon and have been tried out very many times since. Regularly wherever they have been tried they have made trouble. It was sales taxes that started the American Revolution. A national sales tax would be a device to put the cost of the world war on men least able to pay it. A great American authority on taxation (Professor Seligman of Columbia University) says that it would make such trouble in this country as the country has never yet known. Nebraska farmers chose to stop sales taxes before they started; and the gasoline tax proposal was an attempt to start them. Michigan farmers may yet decide that they want an income tax and no sales taxes.

Taxation should be according to ability to pay. A graduated income tax is a tax of exactly that kind. Small incomes are exempt because they are needed; they can not be taxed without lowering the standard of living of the taxpayers. Big incomes may be taxed without any harm; but men who have big incomes are interested in advocating taxes of other kinds. The way to tax the rich man is to tax his income, not his gasoline.

A state income tax is not unfair even for meeting some local expenses, such as the expense of the country school. The incomes of millionaires are not derived from their own school districts; they are contributed by farmers and other producers who must pay for freights, gasoline and farm implements (including Ford cars). Some of the tribute that the people pay to the profit system should come back to them in support of local schools by a state income tax. A real unfairness is giving a poor education to a child merely because the child's parents happen to live in a poor district; that unfairness may be seen in many places in Michigan. There is talk of discontinuing the help that the state now gives to rural schools; instead, that help should be increased. An income tax would supply the money to increase it.

Taxes on farm lands are clearly too high. They are among the reasons why Michigan no longer produces its own food and why the farm population of the United States was 1,700,000 less in 1920 than in 1910 while cities were growing rapidly. Unless some change is made in the system of taxation, Michigan farm lands are likely to have more to pay. There is now a project to prohibit the sale of "lands absolutely unfit for agricultural purposes." Nobody will pay taxes on land that can never be sold. Sending lands back to the state would make heavier taxes to be paid by the rest of the land. That land also would tend to become "unfit for agricultural purposes" because the taxes would be more than farmers could pay.

The project seems honest but a few years ago Kalamazoo celery land and other good Michigan lands were held worthless by everybody. In its time the whole state has been condemned as worthless. We know that our plains are seldom "absolutely unfit" to grow potatoes and cherries, for example. If farming were more profitable, more of Michigan's land could be farmed. Michigan land does not need investigation as much as the marketing system that makes cities pay ten cents apiece for such apples as Michigan farmers can not sell.

There is not need to tax farm land more heavily; there is no need for the state to tax it at all. There is no need to discourage the use of gasoline. The Wall Street Journal says that the profits of the Ford Motor Company in 1922 were over $125,000,000. This is one of the indications that income taxes could easily pay the total expenses of state government in Michigan without hardship to anybody, without lowering anybody's standard of living. In comparison, a gasoline tax is too little a thing to talk about; but the little thing will do much harm if it keeps people from thinking about an income tax and getting it.—C. F., Ansley, Mich.

TAXES $120 IN 1905, JUMP TO $602 IN 1921

I HAVE just read the article by David Friday published in The Business Farmer of February seventeenth, which is interesting. Dr. Friday states the farmers should not expect prices of farm produce to go higher, and I believe Dr. Friday is right. I read an item in the "Grand Rapids Press," written by Ed. Kissenger, of Ashton, who owns one of the best farms in Osceola county. Mr. Kissenger says "tax farms according to their producing value, and tax gasoline 4c per gal., tax cars by their weight, have every one pay a poll tax of $5. In fact try and get every one to bear their share of the tax burden," and Mr. Kissenger is right. Everyone says something must be done for the farmers or our country will go to ruin, and everyone is right, but what must be done?

At our first good roads meeting held in LeRoy, in 1913, one of our progressive farmers (John A. Nelson) stated it was not our work to build the public roads, it was the Federal Government's job, the same as was done in the country he came from, and many other countrys, and Mr. Nelson is right, but when will it be done?

With the present auto traffic the government should build and maintain all Trunk Line and mail routes, it is the only perminent cure for our present condition. Any other system must be inferior, and a make shift, owing to the present distribution of our wealth. Our law makers in Washington are wasting a lot of wind and have been for several years but have done very little to benefit our hundred million people. One bunch wants to cover the ocean with U. S. Ships to compete with foreign countries, another bunch wants to build another Panama canal, another bunch wants to increase the farm loan from $10,000 to $50,000. All this is rot and a damage to our country. Any farmer who demands more than $10,000 is a capitalist, and should be able to farm without suffering.

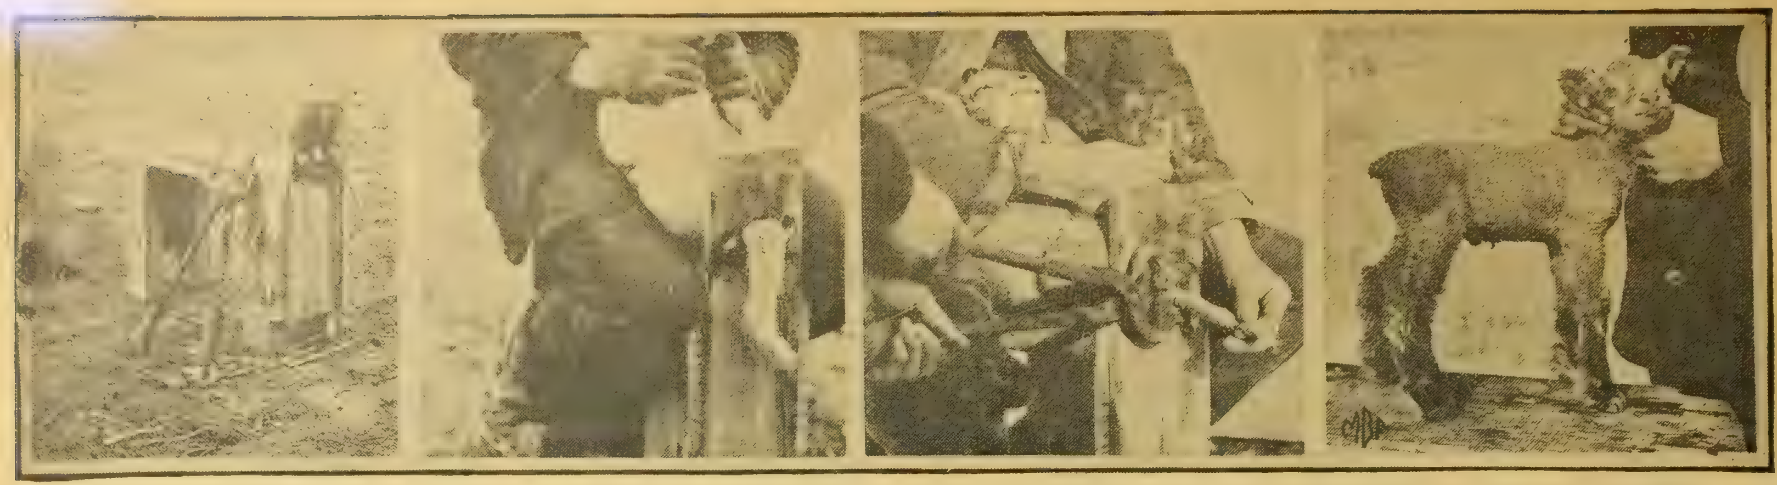
What do we want with another Panama canal, or why build more ships while our harbors are full of them rotting. Our country cannot compete in ocean freight rates with countries where wages are so much lower, and we must have lower rates if we sell our produce. With the great auto factories turning out thousands of cars every day, and the public calling for more roads and better roads, and our state school department demanding of our rural school districts more expensive equipment and continually raising the amount of tuition they must pay the graded schools, and the higher wages for teachers added to our regular township, county and state tax, has raised the taxes to about six times what they were in 1905. I have just looked up my tax receipts for 1905, and I paid on a certain lot of property, $120.69, and on the same property without any improvements made since 1905 the tax for 1921 was $602.82 and the prices on farm products are not much different. Many farmers are leaving their farms and taxes unpaid, this will bring bad results, some of our statesmen are trying to find a remedy, but have met

(Continued on Page 15.)

Growers Should Get 50c Pound for Wool

I HAVE had repeated requests for advice on wool markets and prices. I have several folios of reports, forecasts and subject matter relating to foreign and domestic wool conditions. These can be reduced to advices on prices which is that the average Michigan wool clip should bring the grower 50c per pound. Any forecast or price advice based on statistics may be negatived by a concerted effort to lower the market by buyers during the marketing season, or by the timidity of the sellers failing to hold to a fair market value. There is little possibility of local dealers exerting marketing influences as in the case of beans, for example. Many dealers are "financed" or are simply commission buyers for some wholesaler. Unfortunately there is no community of advices in agriculture operating to advise sellers and acquaint them of the common demononator of values, as Master of the Mich. State Grange A. B. Cook says, the "mark to shoot at."

From the consensus of markets in London, Boston and feelers being tried out in the west, the figures quoted seem probable. Based on production costs, the price is also equitable. However if losses sustained during the last three years are considered the price is low. The general price level of wool on this basis is according to the price index 166 as compared to 100 in 1914. The general price level of all commodities is 164. Iron 170. Lumber 193. Railroad rates 188. Cotton 209. Wool at 50c per pound is not out of line with other staple products. Michigan is second only to Ohio in the production of bright wools, producing around ten million pounds, this including pulled wools. Wool west of the Mississippi river is rated lower than Ohio and Michigan. Ohio and Michigan can make their prices to correspond to the cost of production by consistantly holding for 50c per pound for average clips of wool.—Jas. N. McBride, Pres. Michigan Sheep Breeders Assn.



Lambs for market should be docked as they are more attractive to the buyers. Docking makes the hind-quarters appear more blocky and it also adds to the cleanliness of the animal.

Properly Prepared Lambs Bring Top Price

Market Value of Lambs Greatly Increased Through Docking and Castration

DOCKING and castration of lanbs destined for the market materially increases their market value because of improvement in quality, according to the United States Department of Agriculture.

There are several reasons for this. Docking makes the hind-quarters of lambs appear more blocky and deep and it also adds much to the cleanliness of the animals. Thus they appear more attractive to the buyer when they reach the market. Ewes which are to be kept in the breeding flock should also be docked as a large portion of the undocked ewes will fail to breed.

Ram lambs over three months of age tend to grow thin and develop coarse shoulders and neck. Thin-fleshed, coarse, open-shouldered lambs are not of a desirable quality and when they reach the market they are discriminated against by the buyers because of these features. If the lambs are castrated and docked when they are a few days old their growth will not be retarded. On the other hand they will present a better appearance and if they have been properly fed will have a smooth, desirable finish at four months of age. Lambs of good quality in this condition command a premium over bucky and undocked lambs at the markets. Oftentimes during the period when the Jersey City market is receiving large numbers of lambs from the Eastern states, lamb prices at that market fluctuate sharply because of the high percentage of undocked and bucky lambs which are discriminated against by buyers seeking a high-quality priduct. Improving the quality of the lambs intended for that market will help to stabilize prices, according to members of the trade represented there.

Wether lambs are quiet and easily handled. They feed well and make good gains in flesh, particularly in the hind-quarters, the region of the high-priced cuts. Thus a better quality of carcass is secured together with higher market prices for wether lambs. Meat of this quality when sold by the retailer will result in a well satisfied customer and a future demand for more meat of the same quality. It is often stated that lambs which are to be shipped to the market before they are four months old need not be castrated. This is a mistake as some of the ram lambs will begin to worry the rest of the flock and to lose flesh before this time. Furthermore, the market may not be strong at the time the lambs reach this age and they may be held back by the owner for several weeks for higher prices. During this time the ram lambs will not only rapidly lose in weight but if kept with the rest of the flock they wll also cause the ewes and ewe lambs to lose flesh.

Neither docking nor castrating are dangerous operations if properly performed. Lambs should be docked and castrated when they are from seven to fourteen days of age, as there is practically no retarding of growth and less pain than is the case when they are older. Lambs may be both docked and castrated at the same time, thus avoiding the necessity of handling them twice. The operations should be performed on a clear, cool morning and care should be taken that the animals are not excited or overheated either before or after the work is done.

A sharp knife or some type of docking irons may be used to do the docking. In either case the tail should be cut at the first joint which occurs about one inch from the body. If a knife is used the lamb should be held with the feet up, the rump resting on the top of the fence or upon the knee of the person assisting in the work. There is less pain when the knife is used but there is more loss of blood and it is sometimes necessary to tie a string around the stump to prevent the lamb from losing a large amount of blood. This string must be removed a few hours later. When hot irons are used it is necessary to rest the lamb on a board. The irons sear the stump as the cut is made and this prevents the loss of blood. The wound will heal more slowly, however, than when a knife is used.

In castrating, the lamb should be held in the same position as for docking. The lower third of the schotum should be cut off and the testicles pulled straight out. It is highly important that the wound be washed with an anticeptic solution and that the hands and knife be disinfected for each operation. It is also necessary to furnish clean quarters for the lambs in order to prevent infection of the wounds.

More and Better Potatoes to the Acre

MY certified seed was grown on five acres of well manured clover-sod ground. On four acres I used two tons of commercial fertilizer but did not use any on the other. On the four acres I planted certified seed; on the other mixed seed, mostly Russets. The unfertilized seed yielded 252 bushels; the other four acres 419 bu. In experimenting with the fertilizer I used one ton on the first acre and one third of a ton each on the other three. The one acre yielded 504 1-2 bushels, the other three averaged 390 1-3 bushels. The potato rows were thirty inches apart each way, with an 85 percent stand. I am a firm believer in more and better potatoes to the acre rather than more acres.

My certified seed won first prize at the Michigan potato show in Grand Rapids in December. I also won four other prizes at the exhibit.

I hill-select my seed to plant, taking hills with vines free from disease and with from nine to nineteen perfect potatoes in each.—By E. Sutton, First Prize Winner at Michigan Potato Show, 1922.

"How Shall I Apply Fertilizer to My Corn Crop to Increase the Yield?"

By Special Correspondent

THIS is a question of interest to many corn growers in Michigan and one on which there is not a little difference of opinion among farmers and students of soil fertility as well. The best method, undoubtedly, will vary somewhat in accordance with soil and climatic conditions and with farm practice. Sandy soil, low in organic matter, and heavy clay soil rich in organic matter respond very differently to fertilizers. Rainfall during the growing season is also an important factor in determining the results to be obtained from an application of fertilizer.

Some farmers prefer to apply the corn fertilizer in the hill or row, while others are convinced that it should be drilled solid or broadcasted. The arguments for and against the two methods can be stated briefly.

Fertilizer is applied in the hill so as to be near the seed and give the young corn a "running" start. The corn gets ahead of the weeds and can be cultivated several days ahead of corn that has been fertilized broadcast. The increased yield is usually larger in proportion to the amount of fertilizer used in the case of hill or row application. The claim is made, however, that when only 75 to 125 pounds of fertilizer are applied in the hill or row, it is all used up by the corn crop or if there is a residual effect on the next crop it is only in the old hills or rows and not of much value. It is also claimed by some that small applications of fertilizer cause the crop to draw more heavily on the supply of plantfood in the soil. But so does anything else that is done to increase the yield, such as the use of good seed or careful cultivation. The old adage, "You can't eat your cake and have it," applies very well in this instance. Every bushel of corn takes its toll of plantfood and the only question is, how can this plantfood be supplied most economically?

There is a common impression that fertilizer in the hill cause "bunching" of the roots and that as a result corn fertilized in this way is more likely to be injured by summer drouth. The Michigan Experiment Station has carried on a careful investigation and has concluded that there is no "bunching" of roots nor injury from drouth that can be traced to hill application. The Wisconsin Experiment Station has obtained similar results and it would therefore seem that this objection to hill application of fertilizer may not be so important as was formerly thought to be the case.

There is no need for explanation as to where fertilizer was applied in this field and where it was not—results speak for themselves.

Fertilizer attachments for corn planters are, in many cases, poorly constructed. They too often drop the fertilizer in a "bunch" and do not mix it with the soil. Some of them even deposit the fertilizer in direct contact with the seed and this is very likely to delay or even to prevent the germination of the seed. There is little if any danger in the hill fertilization of corn if the fertilizer is distributed so that it is mixed with the soil near the seed but not in direct contact with the seed.

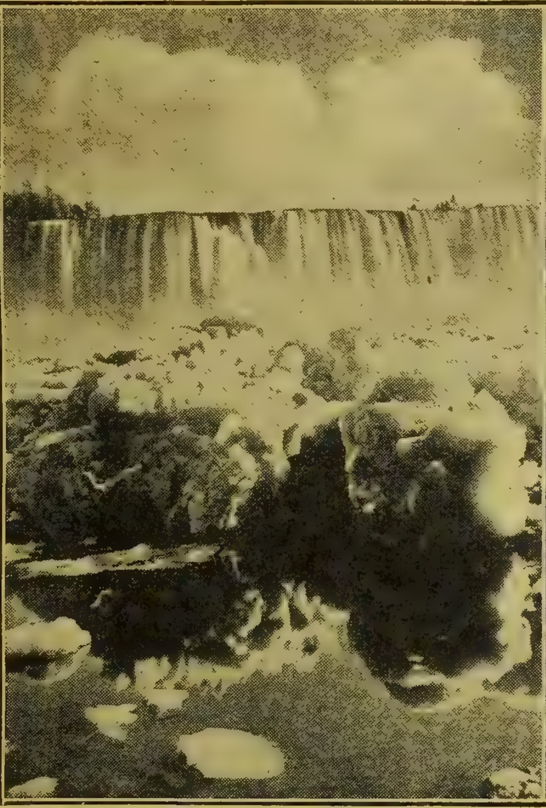
It is pretty generally agreed that the bulk of the fertilizer used in a general rotation should be applied broadcast. Corn fertilized in this way, however, starts slowly and is not benefited materially by the fertilizer until several weeks after planting. There is, of course, a large residual effect from a broadcast application of 200 to 300 pounds of fertilizer on corn.

All things considered, the best results will be obtained if a small amount of fertilizer, say 75 to 125 pounds, is applied in the hill or row and the rest of it applied broadcast. In this way the advantages of both methods of application can be obtained. The corn will be given a quick start, the demand of a larger crop for plantfood will be met, and the residual effect on the following crop will be worth while.

PICTURES FROM FAR AND NEAR

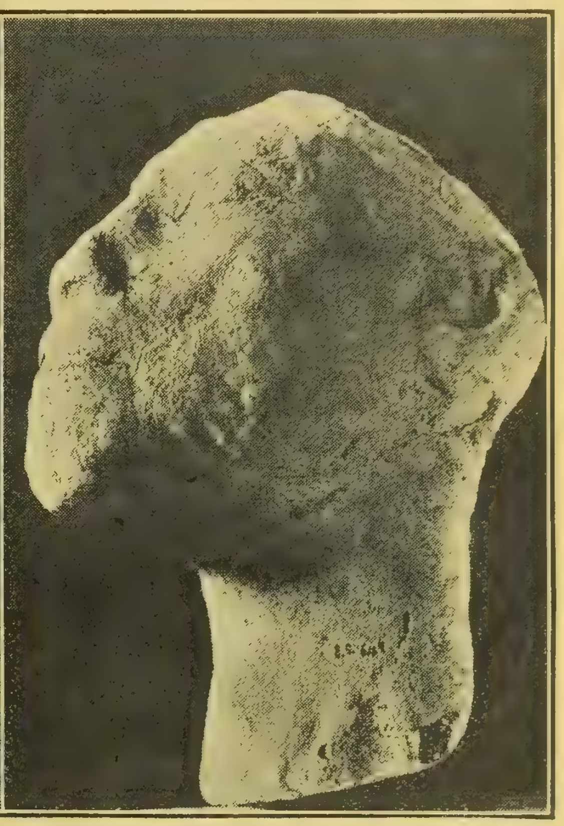
MICHIGAN WOMAN FIRST TO TALK OVER TELEPHONE.—"As near as I can recollect it was in the summer or 1874," says Mrs. E. G. Sovereign of Bay City, first woman to speak over the telephone. "The first words I spoke were, 'Can you hear my voice?' and was surprised when I turned to listen to hear Dr. Bell answer, 'Yes, I can hear what you say.'" This conversation took place over a wire one and one-half mile long at Brantford, Ont.

COW TESTERS MEET AT M. A. C.—The members of the Michigan Association of Cow Testers met last month at the M. A. C. The aim of the meeting was to get a better understanding of the value of the work being done by the testers. The officers and members are as follows, reading from left to right: Front row—B. L. Peck; Harold J. Schaner; S. P. Sexton, Director; Roy Chilberg; Eldon Bruce; Karl S. King; Nicholas Gordon; J. H. Mathieson, Secretary-Treasurer; H. F. Simmons. Middle Row—Ernest Johnson; H. E. Frank; Leslie Wilcox; Fred Leonard, Vice President; Hans Kardel; Oscar Sundell; Hoyt Shisler, President; Eldron Barclay. Back Row—Percy Parkyn; R. G. Powell; Paul Hayward; L. J. Carter, Director; Jesse Huggett; L. D. Leisenring; Fred Walker.



KING WINTER PLACES HIS SEAL.—Together with Mother Nature, he has produced a picture that for loveliness and grandeur surpasses anything mere man could do. Here is Niagara Falls, in the winter time, with ice and snow adding to the splendor of the scene.

JACKIE COOGAN ACHIEVES AMBITION OF HIS LIFE.—Little Jackie. 8-year-old screen actor, reached the height of his ambition when under the kindly instruction of the big traffic cop on 42nd St., and 5th Ave., New York City, he told them when to "stop" and "go".



RELICS OF KING TUT'S FATHER-IN-LAW.—Cast of a death mask of Akhnaton, father-in-law of King Tut-Ankh-Amen, whose tomb was opened recently. The death mask was found in an undertaker's establishment at Tel-el-Amarna, Egypt, and is now on view in the University Museum, Philadelphia, Pa.

SEVEN CHILDREN IN FOURTEEN MONTHS.—That is the record of this southern Maryland ewe. It is rather hard to believe, but here is the record: Twins first in November 1921 and again in May 1922 and final triplets January 1923. The home of this prodigy of the sheep world is the birthplace of Francis Scott Key, author of our national anthem "The Star Spangled Banner."

COMPLETES PAINTING OF PRESIDENT HARDING.—Miss Margaret Lindsay Williams, an artist of renown, came here from Cardiff, Wales, to paint a portrait of the president for the London branch of the English speaking union. Miss Williams completed her work and had the president for his last sitting at the White House, where he consented to be photographed with the artist and her canvass.

85 Pound Standard
Slate Surfaced
Roofing
$2.00 Per Roll
Lay Your Own Roofing This Spring

Ward's Radio Roofing Guaranteed 15 Years

Do it in your spare time. No experience needed. Only hammer and jack knife required. Use our standard Radio Slate-Surfaced Roofing.

Approved by Fire Underwriters
Spark proof. Fire resisting. Better protection than wood shingles. Extra durable and not affected by heat or cold.

Best Standard Quality You Can Buy
Only $2.00 per roll (enough to cover 100 sq. ft.). For old or new roofs, or over old wood shingles.

Red or Green
Non-fading crushed slate surface beautifies as well as protects your home. Guaranteed for 15 years but should last longer.

You Can Do The Same!
"I saved 50c a roll, buying my roofing from you."
Geo. Webber, Hookstown, Pa.

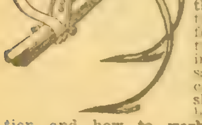
ALL AROUND SATISFACTION FOR ANY CULTIVATION PURPOSE



It's through the right kind of cultivation that foul growths are kept down and can be eradicated. THE KOVAR DIGGER has opened the field for the right kind of cultivation and having exclusive features, will give satisfaction which no other machine will produce. Thousands of farmers have been convinced and we want to show you. Write for free booklet on [illegible] and cultivation and how to work foul growths. KOVAR has the most successful Spring Tooth Corn Cultivator, also Harrow Cart. Write for further information and prices.
JOS. J. KOVAR, OWATONNA, MINN.

FREE MEAT CURING BOOK
To learn the best methods of curing meat, write to E. H. Wright Co., 850 Broadway, Kansas City, Mo., and get absolutely free a new $1 book, "Meat Production on the Farm," which tells all about meat curing. Free to farmers only. Send name today.—Adv.

Farmers Service Bureau

(A Clearing Department for farmers' every day troubles. Prompt, careful attention given to all complaints or requests for information addressed to this department. We are here to serve you. All inquiries must be accompanied by full name and address. Name not used if so requested.)

WORKING FARM FOR THIRD

Please inform us the terms working on a farm for a third.—Mrs. C. E. G., Concord, Michigan.

—Under the one-third stock lease the landlord furnishes farm machinery and all stock and tenant furnishes the labor and gets one-third of the proceeds. Such expenses as thresh bill, seeds, etc., are divided in same proportions as proceeds.

If the landlord furnishes nothing but the farm and the tenant furnishes horses, machinery and labor, he is entitled to one-third of the small grains as the proceeds and the tenant pays for the seed and thresh bill.

The hay is usually divided equally and if baled the landlord pays half. Such crops as hay the landlord furnishes the seed.—F. T. Russell, Prof. of Farm Management, M. A. C.

ENTITLED TO HALF OF STRAW

I have been working on a farm on shares beside of my own farm. The man that is agent of the farm reserves the house and I am working the fields. We do not keep any stock on the farm, raising mostly grain. The agent of the farm sold the straw and refuses to pay me half. The contract doesn't say anything about the straw but it does say: "Each to get one-half the proceeds derived from the the sale of all grains, produce, etc., taken off said farm." Am I entitled to one-half the money from the straw? This straw amounts to about $70.00. I raised the straw and consider I ought to have half of it. Will the farm hold the straw in such a case.—P., Concord, Mich.

—The clause in the contract providing that each shall receive one-half the proceeds derived from the sale of grain, produce, etc., taken from the farm would include proceeds derived from the sale of the straw, and in the absence of a stipulation relative to the straw, each would be entitled to one-half the proceeds from its sale. Some settlement might have to be made to cover the cost of marketing of the straw.—Asst. Legal Editor.

APPLICATION FOR DRAIN

I am working a farm which is owned and occupied by my father and mother. My father ditched the farm several years ago but made no outlets and we have no county ditches in our neighborhood and father's ditches are not large enough to take the water away. What must I do in order to have the drain commissioner establish a drain as such a drain is badly needed and would be a great benefit to the neighborhood? Would I have the right to get out an application the same as if I owned the land and would I have the right to sign an application were one made out and how many signers would it have to have in order to secure the drain?—Subscriber. Vassar, Mich.

—If you have the power of attorney from your father and mother, giving you general powers to deal with their property you would thereby be authorized to sign an application for the construction of a drain.

Section 1 of Ghapter 3 of the Drain law provides that a commissioner will have authority to act upon receipt of an application signed by not less than one-half of the free holders whose lands are traversed by the drain. You should therefore obtain an application from the Drain Commissioner of your county and procure the signatures of not less than half of the property owners whose lands would be traversed by the drain to be applied for.—H. H. Partlow, State Highway Dept.

QUESTION OF NEGLIGENCE

Two of my horses got out in the road. I went after them, while driving them home I met a car. It was just getting dark. A few rode in front of the car the horse walked up into the road. The car struck it and broke its leg. I called a veterinary and he advised me to kill the horse. The driver claims he did not see the horse although he had the lights lit. He was driving at the rate of about fifteen miles per hour. His car was slightly damaged and he told me that he would expect me to settle his bill, on the ground that I was not carrying any light. Can I get pay for my horse?—C. C., Lake Odessa, Mich.

—Your recovery in this case would depend upon the question of negligence. In a recent case, the Michigan Supreme Court held that it is negligence for the driver of a car to drive at such a rate of speed that he is unable to stop within the distance covered by the range of his lights. If your horse had been standing still in the road, it would be negligence on the part of the driver to fail to see it in time to stop. However, if the horse ran into the road in front of the car so as to take the driver by surprise, his failure to stop his car in time would not be negligence. The only way you can recover is by showing that the driver was negligent and that you were not negligent.—Asst. Legal Editor.

NATURAL GAS

I know where there is a place that if you light a match and pass it over it burns like gas. No snow lies on it in winter and it burns till smouthered and there is no smell of gas.—H. L., Gladwin, Mich.

—I would advise that very probably the inflamable gas is actually natural gas. It may have a slightly different composition than ordinary natural gas which will account for the lack of smell. I suspect that you have found one of the numerous gas seepages which occur in a number of areas in this State.

In southwestern Macomb and southeastern Oakland counties the farmers use some of the surface gas, which is struck in wells, for heating and lighting their homes. A gas spring in Montmorency county is so large that probably if the flow could be successfully trapped it would be sufficient for lighting a group of houses. Gas wells of considerable size have been struck in Manistee county around Portage Lake. Such signs are not significant since they are in areas of leakage and not of accumulation. The pool, if the gas is derived from one, in most cases is distant from the seepage. Drilling in the vicinity of such signs therefore would be of little use in most instances. Many wells have been drilled on the basis of these signs and nothing worthy of mention has been found.—R. A. Smith, State Geologist.

REFUSES TO PAY DEBTS

Your Service Bureau seems to answer all questions I would like a reply to this one. A signs notes with B to the extent of $2,000.00 and secures no mortgage. B in about two years refuses to either pay interest or notes or to even renew them. A gets a judgement on stock and machinery being forced to hold a sheriff's sale, and secured about $300 that way. B and his wife own 90 acres in joint deed and A has been told that there is no way to secure a hold on this farm as it is held in a joint deed. If this is a law in Michigan, why couldn't any man that holds a joint deed with his wife on property, refuse to pay his honest debts?—G. G., Breckenridge. Mich.

—The property could not be reached for the satisfaction of the debt. However, if the husband purchased the property after the debt accrued, taking a joint deed with his wife, his undivided half interest could be levied upon for the debt.

Before any person extends credit to another or takes his note without security, he should be sure that the debtor is financially responsible, and if he is depending on certain property out of which to satisfy the debt, he should ascertain whether that property can be reached by creditors.

The law always looks to the securing to every man of his rights and aims to protect him in those rights from unscrupulous practices by others. However, it expects in return that every man will exercise reasonable prudence in his business dealings, and it cannot always furnish a remedy when the injured party has not taken proper precaution in protecting his own interests.—Asst. Legal Editor.

JOINT STOCK LAND BANK

Could you explain the joint stock land bank and how loans are obtained from them, and the difference between is and the federal farm loan. —J. N., Sanilac County, Mich.

—The Federal Farm Loan Act provides for a dual system of banking, consisting of Federal Land Banks and Joint Stock Land Banks. Both are under the same supervision. Federal Land Banks loan their funds through National Farm Loan Associations, and each borrower must take 5 per cent of his borrowings in stock with a double liability on that stock, and must help maintain the association while he is a member. These associations are limited to loans of $10,000.00 and to men who are actually living on the farm. This bank is limited to loans not to exceed $37,500.00 to one individual, but is not limited to men who actually live on the farm, just so they use the funds for agricultural purposes.

The purpose of these two types of banks was to give the farmer the choice of joining a co-operative institution or making a loan direct through a Joint Stock Land Bank without any further liability. This is the reason why there has always been a difference of one-half of one per cent between the interest rate charged by the Federal Land Banks and by the Joint Stock Land Banks. The actual cost of the money to the Borrower is the same.

There is no commission charge in our loans. The total charge we make is a flat charge of $5.00 per thousand to cover the services of the Federal Appraiser and the Title Examiner. We require that every application coming to us be accompanied by an application fee of $12.50, which is credited to the $5.00 per thousand charge when the loan is closed. Our Mortgages are exempt from the Mortgage Registration Tax in the State of Michigan.

On account of the limited profits, however, to Joint Stock Land Banks in this business, it is necessary that we receive a number of applications at one time in order to enable us to make all inspections at a reasonable cost, unless an application is for a large amount.

If any of your neighbors or friends whom you feel would be desirable moral risks, and who own well managed farms, wish to avail themselves of this type of financing, we will gladly write them at your or their request.—John H. Kraft, Vice-Pres., First Joint Stock Land Bank, Cleveland, O.

HUNTING WITH FERRET ON OWN FARM

I would like to find out if a person is allowed to hunt with a ferret on their own farm, and do they have to get a permit to have one in possession?—W. K., St. Charles, Mich.

—The law provides for the issuing of permits to farmers and fruit growers only, to use a ferret in hunting rabbits on their own lands. Thse permits are issued at the discretion of the Director of Conservation.—Dept. of Conservation.

LOGS FOR BARN FLOOR

Would poplar logs eight inches through at small end flattened on one side be strong enough for barn floor with three lengths for barn 36 feet wide? That is with 12 feet between supports in basement. 16 feet to eaves of barn. How close would they need to be spaced? Would peeling them when green help the strength of them?—R. R., Farwell, Mich.

—Poplar logs 8 inches through at small end placed 18 inches apart would give sufficient strength. Peeling them would lessen the likelihood of their decaying and would be advisable.—F. E. Fogle, Asst. Professor of Farm Mechanics, M. A. C.

HOW TO PROCEED TO COLLECT NOTE

On Dec. 12, 1921, our rural carrier borrowed $25 from me. He said some of his checks were lost in the mail and he needed the money. I gave him a check for $25 and he gave me a note for $30 due in six months. When the note was due in June I asked for the money. He said he could not pay until July. In July he put me off until August and in August he said he would pay it in the fall. In December, 1922, I left the note at the bank for collection. The cashier of the bank sent him notice to which he paid no attention. This man has no one to care for but himself. Would you please let me know how to collect this money. Any information you can give will be greatly appreciated.—F. O., Minden City, Mich.

—If there were any indorsers on the note, you could proceed against them, after making proper presentation to the maker for payment, and after giving notice to the indorsers, your only recourse would be to sue on the note.—Asst. Legal Editor.

SMALL WHITE BUG AROUND LILY ROOOTS

I have a lily and there are small white bugs in the ground around it. When I put water on the lily they come to the top and float on the water and when water settles down they go back in the ground again. What can I put on to kill them? The lily is doing fine. The bug has been in the ground about one year.—A. W. H., Fairgrove, Mich.

—I cannot, of course, be sure what the insect is but I would suggest that a little black leaf forty or fifty percent nicotine sulphate be added to the water which is applied to the plant, about one teaspoonful to a pint of water should be sufficient and if this is used several times in watering the plant I have no doubt that the insects will be destroyed without injury to the plant.—R. H. Pettit, Professor of Entomology, M. A. C.

ENTITLED TO DOWER INTEREST

I am writing for information. Can an old lady, marrying an old man, collect anything from the estate on the death of man, the woman not helping accumulate any of the property but merely taking care of man? —H. D., Big Rapids, Mich.

—Upon the death of the husband without having made a will, the widow would be entitled to her dower right interest, that is, the use during her natural life of one third of the lands which her husband owned while they lived together. Or she may choose instead of dower, her interest as an heir of her husband. In the latter case, if the husband had two or more children, the widow would receive one-third and the children two-thirds of the estate. If there were only one child, the widow would receive one-half and the child one-half. If there were no children, nor heirs of a deceased child, the widow would receive one-half and the husband's father, mother, brothers, sisters, nephews or neices one-half. If there were neither of the above named relatives living, then the widow would receive the entire estate.—Asst. Legal Editor.

HIRING SCHOOL TEACHER

Can a director alone or the three officers of a school district alone hire a teacher at the time of the Xmas vacation or first of January? Has the law changed in the last few years when they used to take a vote of all the one at the school meeting in July? A few years ago no teachers were hired until the night of the school meeting in July. Last Xmas our director hired the teacher again for another year.—E. M., Clifford, Mich.

—The board of education is the authority for the employment of teachers and they may do so at any time during the school year. The director alone cannot legally hire a teacher. The legal voters have not had the right to direct the employment of the teacher in over forty years at least. Section 13 of Chapter 3 of Act 164 of the Public Acts of 1881 provides that the board is the authority for employing the teacher and such has been the law ever since.—W. L. Coffey, Dept. of Public Instruction.

CAN MOVE OR SELL

A rents a house and barn from B for cash rent, no land included. A buys feed for all his stock, draws it there and feeds it. Is B entitled to the manure because it is not on boards or can A move or sell it if he wishes?—L. B., LeRoy, Mich.

—Under the circumstances you mention, the manure would be personal property, and A could remove it. The fact that it is not on boards makes no difference except that it is more difficult to ascertain the amount A is entitled to.—Asst. Legal Editor.

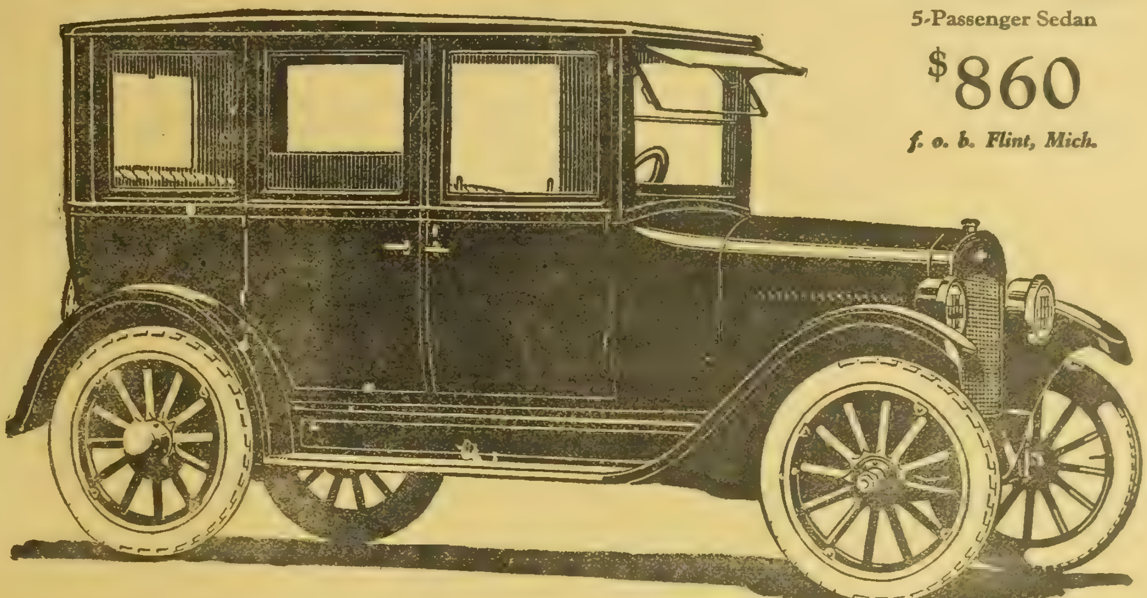
CHEVROLET

for Economical Transportation

SUPERIOR Model
5-Passenger Sedan
$860
f. o. b. Flint, Mich.



Holds First Place Among All Show Cars in Number of 1922 Sales

During 1922 the public bought more than 50% more Chevrolets than of any other fully equipped car, giving Chevrolet first place in number of cars sold among all cars exhibited at the 1923 N. A. C. C. Shows.

The remarkable rise of Chevrolet during the last twelve months has proved that the Chevrolet Motor Company has correctly gauged the shift of public sentiment towards the most economical unit of transportation that also meets modern requirements as to quality.

Just count the Chevrolets along the great highways and parked at the curbs of every town and city.

The Truth About Henry Ford

By Sarah T. Bushnell

Mr. Ford and Religion—His Wife and His Home

(Copyright by Reilly & Lee Co.)

(Continued from March 3rd Issue)

The Ford residence is of gray native stone and built along the Gothic lines. His study is in the round tower. Long bookcases shelter his books, the technical ones among them showing plainly their constant use, and a large window looks toward the bungalow which Mr. Ford built in the first days of his prosperity as a resting place where he would be safe from intrusion. Its broad veranda and great fireplace surrounded with easy chairs make it comfortable in summer or winter. The study windows overlook what at first glance seems an Indian mound, but which is the natural shelter for the electric boat which Mrs. Ford drives up and down the river. All the windows give a view of the River Rouge, which has been compared to the James in Virginia.

Within a short distance of the residence is the gray stone garage in which are Mr. Ford's laboratory and experiment rooms, and where he perfected the tractor on which he worked harder than on any other of his inventions. In reality this garage building is a modern power plant with exceptionally heavy walls to shut in all noise. Here the inventor often labors until late in the night, just as he did in the red brick barn in Bagley street, Detroit, where he made his first car.

* * * *

About ten years ago a certain clergyman in Detroit, who was ambitious to build a costly church, went to Mr. Ford for a contribution, hoping to get a large sum.

"No," replied the millionaire, "I don't believe in expensive churches."

"Then," said the clergyman, "will you come to my next service and let me preach a sermon especially for you? I hope to convince you that you are wrong.".

The following Sunday the minister cast a searching eye over his congregation; then he announced his text. It was from I Chronicles, 17 chapter and first verse; "And it came to pass, when David dwelt in his house that David said to Nathan, the prophet: 'Lo, I dwell in a house of cedar, but the ark of the covenant of the Lord dwelleth under curtains.' " The minister raised his eyes from his Bible and exclained: "The word curtains used here means tents." He followed the text by reading the verses one, two, four, five and nine with especial emphasis on the fourth, fifth and ninth. Then he turned the pages to II Samuel, 7 chapter, and read:

"And Nathan said to the King, 'Go, do all that is in thine heart; for the Lord is with thee.'

"And it came to pass the same night, that the word of the Lord came unto Nathan, saying:

" 'Go and tell my servant David, "Thus saith the Lord, Shalt thou build me an house for me to dwell in.

" 'I have been with thee whithersoever thou wentest and have cut off thine enemies from before thee and I will make thee a great name, like unto the name of the great ones that are on the earth.' "

The Clergyman launched into his sermon. After he was well started he fixed his eye on Henry Ford and said: "The church is the dynamo of the Lord's business. It is right and proper that churches should be beautiful and should be as lovely as it is possible to make them. Why should we live in fine houses, houses of cedar, and worship the Lord in tents? There is a rich man in this city, a very rich man, who considers that his engine is the dynamo of his factory. It has always been the custom to place such engines near the rear, in an ugly section of a factory, facing an alley. This rich man had put his engine in the front part of his factory, it is in a beautiful room with pure white tiling. He keeps men constantly polishing and cleaning it; he has surrounded it with handsome plate glass windows. The engine faces the most expensive thoroughfare in our city. Sightseers stop to admire its immaculate beauty. The very rich man loves this engine; he surrounds it with the best that money can buy. He considers it the dynamo of his business. This is true with churches. They are the dynamo of the Lord's business. They should have in and around them everything that is lovely and beautiful. No expense should be spared in the construction of a church nor its location."

The minister went on and on with his argument. The following week he went to see his richest parishioner. No mention was made of the sermon until he was leaving.

"I haven't changed my mind," said Mr. Ford then. "I feel just as I did. I don't believe in expensive churches. But I do think that a minister should be paid a salary that will enable him to live in comfort, and lay by something, so that he can buy a home or a farm or a little place in the country where he can round out his last days. I'm going to disappoint you; I'm not going to give you anything for your new church." He handed the minister an envelope. "Please give that to your wife when you get home, just a little token of my regard for you both."

When the rector returned home he told his wife of the disappointing visit and handed her the envelope. In it were twenty one-hundred dollar bills.

The rector later built his big church. He succeeded in his ambitions. He was taken abroad, and sent to various parts of the country by the millionaire; eventually he received a large salary.

Eventually the minister and his wife drove into the country; they found a little fruit place, with a tiny house on it, something to tie to in case of old age or misfortune.

It is characteristic of Henry Ford that he took no offense to the frankness of the sermon, but did not change his mind.

* * * *

In order to keep his factory running full blast through December, 1920, Mr. Ford took a loss of fifteen millions. Against the advice of his business associates he kept production going until after Christmas Day. When New York reporters telephoned his office he refused to give his reasons for the shut down, his idea being that a statement regarding his retrenchments and the re-organization of his business might depress the market. Immediately there arose wild rumors that he was in financial difficulties. Happily, these were untrue. His aversion for borrowing has placed his gigantic undertakings on a safe financial footing. Detroit is not New York; Griswold is not Wall Street, but a prominent Detroit banker has said: "If Henry Ford should need large sums of money, Detroit will secure it for him."

However, it was the serious illness of his son, who went through an appendicitis operation, which caused Mr .Ford grave concern during the winter of 1920-21, and not financial difficulties.

A joy he is getting from his money is refurnishing his mother's old home, which he bought from his brother, John. As stated before, the town line when finally surveyed ran through this house. The county commissioners ordered the house moved so that a road called "Townline" could be built. Accordingly, the dwelling was thrust back to make way for progress, and the forest trees in the yard were hewn down because they interfered with the grading. Mr. Ford is having similar trees placed around the old home. He has gone into the attics and barns of his brothers' houses and has found discarded furniture which he associates with his mother's memory and he has said to the rest of the family: Before many years roll by we will begin to grow old. We will fix the home place like mother and father had it. We were so happy when we were children there together."

More than his vast wealth, Mr. Ford's real riches consist of a wife, whose constant thought is his health and well being; a loving son and two small grandsons, who are his pride and joy.

CHAPTER X

His Wife and His Home

No one could hope to write an adequate review of the development of Henry Ford's life and character without including some account of the wife who has meant so much to him in so many ways from the day he devised the watch with four hands, through all his struggles, disappointments and successes, down to the present time. During all these years the home life of Mr. and Mrs. Ford has been ideal.

One must know Mrs. Ford intimately to understand fully her part in the Ford achievements. She is thoroughly home-loving, capable and charming. So considerate is she, so unpretentious and gracious, that visitors to the Ford home forget that their hostess is one of the richest women in the world, owning in her own right a one-third interest in the corporation that is reported to pay an annual tax of eighty millions.

Mrs. Ford dresses in shades of brown or blue, and mink and sable are her favorite furs. She is small of figure, youthful in appearance, with chestnut eyes. Her voice is low and musical. We sat one winter afternoon in the sun parlor of her home watching the birds about the weather-worn stump on which each winter day she places fresh grain for her feathered friends. Beyond, the River Rouge wound in and out among tall forest trees, snow covered the ground and the frozen water was a sheet of gray ice. Behind us in the drawing room, which is paneled in French-bleached American walnut and furnished with cozy chairs and heavy velvet draperies of mulberry color, long hickory logs were crackling cheerfully in the carved white marble fireplace. The conversation drifted to the part that woman must take in present day affairs.

"There are so many demands for help that it would be unfair to take them lightly or to consider them in a haphazard, happy-go-lucky fashion," she said softly. "If they are handled carefully and systematically women can uplift, not pauperize, those they seek to help. Every village, city and state has its problems to solve. It seems to me that every homeloving woman should use her personal influence to cope with all the issues that directly and indirectly touch her home. If she does this," she added with a smile, "she will be compelled to take an active interest in politics. She may have to get out her school books and brush up on community civics and the science of government; for woe be unto her if she fails to understand exactly what she is undertaking. Of course," she added whimsically, "it would be easier and pleasanter to sit at home by the fire and knit, or chat idly over our teacups; but those times are slipping from us."

Mrs. Ford seldom has an ilde moment. Large wealth has brought her pleasures and privileges; it has also brought heavy responsibilities. Each day she receives volumes of mail. Her desk overflows with appeals for help; to answer them personally would be an endless task. Her name and assistance are sought by local, state, national and international welfare workers. Personally she visits the detention homes; she lunches at the House of Correction; she consults with the women's police board officials. Each case she seeks to help is first investigated by experts through authorative channels. Some of us know of thousands of families she helped while the factories were closed; many of those she visited; to others she sent her agents. She works constantly for the Girls' Protective League and other active organizations. For many years she has been treasurer of the Priscilla Inn, a home in Detroit, where girls can lead carefully chaperoned lives and enjoy comforts not easily obtained in an overcrowded manufacturing city like Detroit.

Dearborn estate, and half-way between Detroit and the University of Michigan at Ann Arbor, is a square red brick home, "Valley Farm." Passers-by, in automobiles, gaze at it with frank curiosity. It is understood that Mrs. Ford is deeply interested in social welfare problems and that this Valley Farm belongs to her. If the inventions and vast wealth of Henry Ford have made him a world figure, they have made the activities of his wife of interest wherever their name is known. The general public knows little of the work accomplished at Valley Farm; except that it is some sort of rescue work. The old house is bravely facing new conditions. It is doing ultra-modern work; developed scientifically, by professionally trained workers, for the benefit of posterity. This is possibly the strongest link in the chain of work of the Dunbar Memorial Woman's Hospital, and the most far-reaching of all the great and good achievements of Detroit women. The farm, thirteen miles out in the country, has proved a boon to the hospital in Detroit, which is located on the busy, noisy corner of Frederick and St. Antoine.

Through Mrs. Ford's courage and thoughtfulness in sponsoring this work, its results will be felt to many generations. It has meant the salvation of thousands, whose successful reclamation has blezed the trail for welfare workers.

What has actually been accomplished is of more importance than any general theorizing. Mrs. Ford has been affectionately called "the erring girl's friend." She says, "Men are willing to help boys and pulsiveness have brought trouble and distress to many girls and to their families. It is wonderful what has been done for them by those in charge at Valley Farm. They do it beautifully and sympathetically. They reach the girls when they are friendless, depressed and often bitterly antagonistic to the world. The quiet activities include two months' training and hygiene, household arts and parental duties. The kindly, far-sighted board of trustees and the tireless, unselfish trained nurses assist each one to secure work and establish a clean, wholesome home."

* * * *

Mrs. Ford has opened the door of opportunity for many ambitious people, and has put success within the grasp of others. She is constantly lending a helping hand to those who need it most. Each day she is confronted with a round of duties, for she is the energetic, capable type of American womanhood which is playing a tremendous part in world affairs today. Her creed is that "Money should be used to make the world better, not to create envy and breed selfishness."

Being a musician, Mrs. Ford has a concert piano in her family living room; a pipe organ in the walls of her drawing room; in her library, which is lined from floor to ceiling with much-read books, is a Victrola; in her sun-parlor an Edison. "Music is refreshing," she says.

She organized the Dearborn Garden Club, of which she has long been president, and through her influence the members combine well-fare work with nature study. This club holds two annual flower shows. Blue Ridge Mountain rhododendron, which in June is laden with gorgeous pink blossoms, flanks the Ford doorway and the lovely graystone mansion is very comfortable, very homelike.

Seven thousand acres are in the estate. The land stretches back to the city limits and in the opposite direction toward the tractor plant a River Rouge. The first home built by Mr. Ford still stands in the grounds. It is an attractive, frame farm house, with awide veranda and green roof, and is furnished as it was during their early housekeeping days. Near it is a rustic bungalow, where guests are sometimes entertained.

In spring and summer a rush of lilac and heliotrope fragrance surges through the open windows of Mrs. Ford's rooms. These purple flowers are banked around the gray-stone walls, border the flagstone walk and cluster under the big trees. The heliotrope trees she propagated are from slips which the mistress of the house raised with infinite care. In autumn they are taken into the conservatory; the following spring they are re-set outdoors. This cycle, followed year by year, has produced specimens five feet in height, with trunks four inches in circumference. Some of her other flowers are blue larkspur, yellow gaillardias, bronze salpigolossis, blue seabosa, sweet peas, asters, shirley poppies, marigold and gourds which she raises to please her grandchildren. The rose garden is the only bit of formal landscape. She said one day while talking about her flowers: "I cannot buy everything I crave. Like my mother I love old-fashioned pinks. I haunted florists' shops, old homes and cemeteries in search of these tiny, red-flecked, spicily scented plants. It was my dress-makers sister who, generously, sent the basket of roots to form the nucleus of my large beds."

Two miles from the estate can be seen the twinkling lights of the little village of Dearborn. To it she has given a library site, and has built and given to the Episcopal church a large brick rectory; she is a member of the social service committee of her church. Greenfield, where she was born and reared, is five miles from Dearborn. In the summer Mrs. Ford takes a family party for a cruise on their yacht. She has traveled the world over, but, with the exception of a small place at Fort Myers, Florida, which Thomas Edison persuaded them to purchase next to his winter cottage, the Fords have never owned a home outside of Detroit or Wayne County. "We have lived here always," she say, "and here we love to stay."

Persistent sightseers have made it necessary to keep the gates of the estate locked and guarded. All the servants, both in and outside the mansion, have held their positions many years. They have an air of courteous consideration and softness of voice which they seemed to have caught from the owners of the home.

The country and the wide outdoors hold for Mrs. Ford more attractions than the social life of any city, yet in her home she has entertained inventors, statesmen, capitalists and titled visitors. John Burroughs was a frequent guest. He enjoyed the birds, flowers and native trees which are under the care of Longfeather, a southern Indian. In the library is an autographed set of Burroughs' books; in a secluded part of the grounds is a rough bronze statue of him, and on the drawing-room table an exquisite miniature of the great naturalis.t John Burroughs once sent to Mr. and Mrs. Ford a carload of red sandstone from the Catskill mountains of his beloved native state, New York. These stones were worked into a sort of shelter for the bronze figure and for the bird pool near it. This spot the Fords called their "Burroughs Nook." Many rare birds, including Kirkland's Warbler and other unusual members of the feathered family, tarry at this quiet retreat, and here Burroughs, himself, discovered several northern birds, including the Bohemian waxwing, which he had long hoped to see, but had never been able to find elsewhere.

Since his death Mrs. Ford and Mrs. Edison have been made members of the executive board of the Burroughs Memorial association. They attended his funeral and went to New York two weeks later to formulate plans for preserving Woodchuck Lodge, Slab Sides (where Burroughs had his study and where he used to write his books) and Riverby, which was a more pretentious home near Poughkeepsie, just outside of the small town of West Park, New York.

Hidden Values

They Keep Essex Young

From the first Essex wins the admiration of owners.

But the greatest Essex enthusiasts are those who have driven their cars 50,000 miles or more. They have discovered the hidden values.

Design and construction details not observable in the new car assert their importance as use increases. They keep the car young.

Essex values extend to the minute details. The finest bearings made are used throughout. They are to an automobile what jewels are to a watch. Parts that wear are inexpensively replaced.

In chassis and body, Essex throughout possesses qualities essential to long hard service. That means economical service, always.

If Ruptured Try This Free

Apply it to Any Rupture, Old or Recent, Large or Small and You are on the Road That Has Convinced Thousands

Sent Free to Prove This

Anyone ruptured, man, woman or child, should write at once to W. S. Rice, 408B Main St., Adams, N. Y., for a free trial of his wonderful stimulating application. Just put it on the rupture and the muscles begin to tighten; they begin to bind together so that the opening closes naturally and the need of a support or truss or appliance is then done away with. Don't neglect to send for this free trial. Even if your rupture doesn't bother you what is the use of wearing supports all your life? Why suffer this nuisance? Why run the risk of gangrene and such dangers from a small and innocent little rupture, the kind that has thrown thousands on the operating table? A host of men and women are daily running such risks just because their ruptures do not hurt nor prevent them from getting around. Write at once for this free trial, as it is certainly a wonderful thing and has aided in the cure of ruptures that were as big as a man's two fists. Try and write at once, using the coupon below.

FARM MECHANICS

SAFE AND EFFICIENT TOOLS FOR THE USE OF EXPLOSIVES

TO use high explosives with the maximum of safety and efficiency, various tools and accessories are necessary or desirable. Of course the character of the work governs to a great extent the kind of tools required and to certain extent the blasting accessories also.

A four-pound hammar and a drill are necessary tools for shooting boulders that can not be blasted in any other way. A round soil punch bar pointed at one end and with an expanded head on the other, with a heavy sledge hammer or maul is necessary for quick work in shooting stumps or tree planting or subsoiling in hardpan or dry clay. A punch bar of different type is useful in moist ground, muck and swampy land. This consists of a length of two inch galvanized iron pipe about five feet long, pionted at one end and threaded to receive a "T" at the other. Two shorter pieces of pipe about a foot long each threaded into this "T" which forms a handle. This make a convenient punch for one or two men to operate where the soil permits but it is not adapted to being driven down by a hammer. An axe or mattock are convenient tools for clearing brush around stumps and boulders and a sawed off broom stick or rake handle makes a very efficient tamping stick. A shovel handle with the rounded end sawed off square, leaving the offset end to hold by, makes a convenient tamping stick in some kinds of work. The tamping stick is used for pressing the charges of dynamite into the bore hole and for pressing in the tamping such as earth, clay or sand to confine the charge. It is not safe to hammer this at any time; in fact, it is extremely dangerous. The charges are pressed in firmly but not pounded.

Various types of soil augers are used, but an ordinary two inch wood auger with an extension welded on the shaft which ends in a ring through which a wagon spoke can be used as a handle, answers the purpose very well. Do not make the mistake of using too small an auger: Two inches in diameter is about the minimum. A straight steel bar sharp pointed at one end and chisel-pointed at the other, about seven feet long, made out of one-inch or one and one-quarter inch drill steel makes a very handy tool for making holes under stumps and boulders, getting between roots which the auger becomes tangled with, and for cutting off rootlets with the chisel end.

In the blasting accessories line you will require besides the dynamite, some blasting caps and fuse or electric blasting caps, leading wire and a blasting machine. The electrical method is much safer than the can and fuse method but the initial cost is somewhat greater as you have to buy a blasting machine and leading wire. The electric blasting caps however do not cost much more than blasting caps with the required amount of fuse. Cap crimpers are a desirable and necessary part of your equipment if you use the cap and fuse method, and are convenient even with the electrical method, as one leg of the crimper is pointed for the purpose of punching a hole in the dynamite cartridge in which the electric blasting cap is inserted. The most convenient leading wire is called duplex wire because it has two wires laid parallel to each other and insulated from each other and from the ground. This is generally sold in lengths of 250 feet. A shorter amount than this is not particularly safe for shooting large size stumps in the open. The No. 2 blasting machine is the best all round arrangement for generating current for electric blasting as the terminals are dead except at the moment the machine is operated. Many accidents have occurred when dry cells or storage batteries are used, due to the fact that their terminals are always alive until the battery runs down.

A necessary rule in all kinds of electrical blasting which is put with all possible emphasis is this: Disconnect the leading wire from the battery immediately after firing a shot of attempting to fire one. In looking for a broken wire anywhere in your circuit, first make sure that the battery is disconnected, otherwise there may be an accident.

A galvanometer for testing the continuity of the circuit is desirable but not absolutely necessary, for the general run of agricultural blasting unless you expect to go into the business. The same may be said of the rheostat which is an instrument for testing the blasting machine to see that it is in working order.—Arthur LaMotte, Mgr. Technical section, Explosives Dept., E. I. du Pont de Nemours & Co.

FRUIT AND ORCHARD

Edited by FRANK D. WELLS

MAKING UNPROFITABLE ORCHARDS PAY

MEASURED by the abundance and regularity of the crops of high-grade fruit produced, there are many apple orchards of bearing age that are not successful. Because a large number of these unprofitable orchards can be made to yield good crops of high-quality fruit by special treatment, the United States Department of Agriculture has prepared Farmers' Bulletin 1284, Apple-Orchard Renovation, by H. P. Gould, which discusses the principal practices found useful in bringing neglected trees back into profit-producing condition.

Orchards in need of renovation are found not only in sections where the home orchard or fruit garden is the prevailing type of fruit growing, and in regions where orchards of considerable size occur only occasionally, but also in the recognized commercial apple-growing districts. Some orchards are not worth the time and expense necessary to renovate them. In deciding what is to be done the following factors need to be considered: The orchard must be on a good site with no rock ledges or hardpan near the surface, well drained and without unusual danger from frosts; the trees must have good vitality, without decayed trunks, cankers that girdle the limbs, or weakness that would make good growth impossible; finally, the varieties must be good unless it is practicable to top-graft the trees.

A neglected orchard is always a menace to other orchards in the neighborhood and in sections where there are many commercial plantings much damage may be done by insect pests and diseases that have their source in badly infected trees. In some states a neglected orchard is practically declared by law to be a public nuisance and is treated accordingly. If the owner will not clean it up, public officials do it and the expense becomes a lien on the property until paid.

As a rule, says the author of the bulletin, a much-neglected orchard does not justify its existance. If an orchard is worth keeping it is worth giving good attention; otherwise, the trees merely encumber the ground and interfere with its use for other purposes. If an apple tree is not of value for fruit production it may be worth converting into tool handles, plane blocks, and other useful things.

Persons interested in renovating orchards or those who wish to decide whether or not a certain orchard is worth the attempt should get the bulletin, which may be obtained without cost from the Department of Agriculture, Washington, D. C.

RENEWING THE STRAWBERRY BED

RATHER than plow it up and set a new one, the old strawberry plantation may be renovated when it has become unprofitable. As soon as the berries have been picked, and new runners have begun to root, plow up the row, leaving a strip a foot wide in the center between rows where plants have rooted. Then harrow down level. Some of the plants will be destroyed with the harrow, but if an old bed has been al-

Your Tractor

For threshing, plowing, road grading, or any other kind of *heavy* work you want a Tractor that will deliver ample power easily—surely—steadily—and continuously day after day and week after week until the job is done.

Then it must be ready for the next job.

In addition you want a tractor that is so strongly and well built that it will stand up under this heavy work for a long period of time, with a low up-keep cost.

Ability to do the required work for a long period of years and at low operating and upkeep costs makes a heavy duty tractor profitable.

All these requirements are met in the

NICHOLS-SHEPARD
Oil-Gas Tractor

It's a *strong, well-built* tractor designed to do *big work.*

Has a slow speed, 2-cylinder powerful motor that burns kerosene perfectly at all loads.

Starts easily on the coldest mornings.

Does not burn out or shake itself to pieces like the light-weight, high-speed tractors.

It has the power—at all times—and is a giant for work.

The Nichols-Shepard Oil-Gas Tractor drives a thresher with just as steady, even motion as a steam engine.

Is is THE Tractor for heavy duty.

Grown From Select Stock—None Better—53 years selling good seeds to satisfied customers. Prices below all others. Extra lot free in all orders I fill. Big free catalogue has over 700 pictures of vegetables and flowers. Send your and neighbors' addresses.

R. H. SHUMWAY, Rockford, Ill.

lowed to fill out solidly from row to row there will still remain plenty of plants. The fresh earth that is dragged around the plants will be of benefit, while the teeth of the harrow will loosen the crust. After ground has produced two or three crops of berries it is likely to need fertilizer, and this may be scattered along the plowed strip between the new rows. The strip that has been plowed up should be stirred frequently through the summer, and as much fresh soil as possible pushed in between the plants. If the plants should be very thick, a strip even less than a foot in width will be sufficient for the new row. Stable manure should be used only when the ground may be cultivated to destroy weeds and grass.—H. F. Grimstead.

PRUNING AND PROPAGATING BOX

Is it possible to root boxwood from cuttings? The kind I have is the tall-growing variety; not the low bushes, usually found in old gardens along the path. Is this the proper time to trim them?—C. H. P., Mich.

—Boxwood can be rooted from cuttings made of young shoots, 4 or 5 in. long, either in the spring or fall. Some growers are quite successful in rooting them planted in sandy soil in early spring, but the surest and most successful method is to handle them under glass, either in the green house or cold frame. In either case they should be planted in good propagating sand, and the glass shaded with whitewash to keep the temperature down on bright days. Boxwood, like mostly all other evergreens, may be pruned any time that the wood is not frozen.

PRUNING CHERRY TREES

I have some cherry trees, planted last year and year before, and ask just where they should be pruned.—V. W. B.

—When planting is done in the fall there should be no pruning until spring. If one-year-old trees are planted, they should not be touched except to be headed off at the proper height in case they would otherwise make too high a head. If older trees are planted, all branches not needed for the framework of the tree should be removed, and the remaining branches should not be pruned. The newly planted tree should have plenty of foliage, and as soon as possible. The last year's growth which is left for the framework will give more foliage if left entire, since the large perfectly developed buds at the ends of the branches, which would be removed if pruned, are the buds which give the most luxuriant foliage in the shortest time. Further than this it is not good practice to prune cherry trees at all, except to remove dead and broken branches incident to picking, and to remove entire such other limbs as are not desired.

SAVING THE HAY THROUGH RADIO

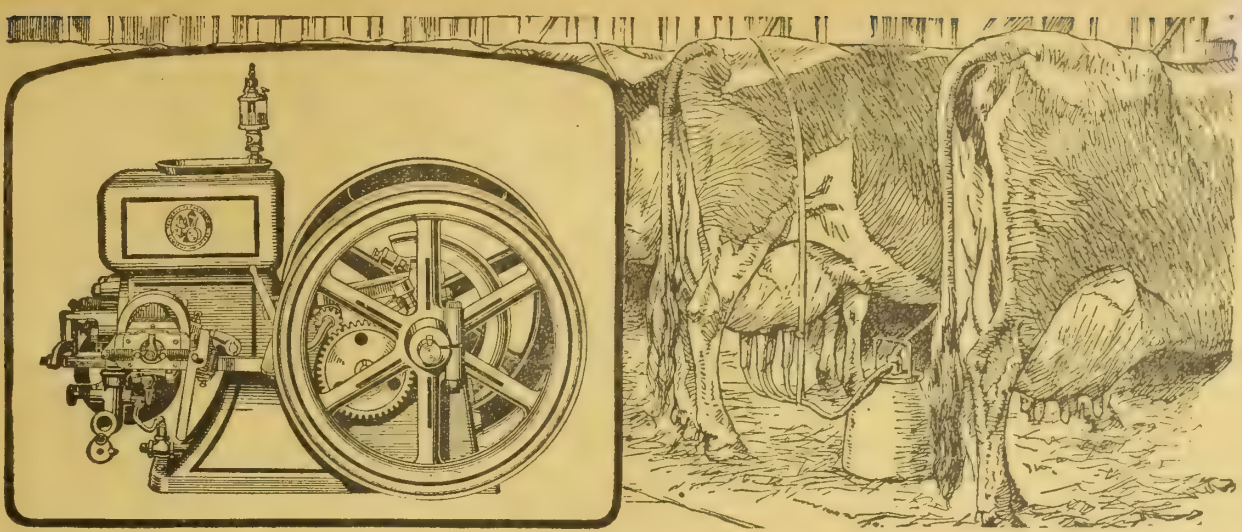
LAST June and July were two of the wettest months so far as rainfall is concerned that New Jersey has ever seen. Farmers all over the state lost thousands of tons of hay because the heavens wept so continuously that it was impossible to get hay sufficiently dry and well enough cured to put in the barns before it had turned black with rot and spoiled. If a farmer could always know exactly when the rain was coming he could beat the game by not mowing down his hay until old Sol, the sun and boss of all hay makers was going to show his face.

E. Smith Hoover, Manager of the State Farm of Annandale obtained this information over the radio and as a result has his barns full of an one-hundred percent crop of fine alfalfa and clover hay. He never lost a load all summer.

During haying season every morning at eleven either Mr. Hoover or his wife tuned up their set and listened for WJZ, the Newark Broadcasting Station of the Westinghouse Company, which gives out the U. S. Weather Bureau forecast. As soon as the news came Mr. Hoover knew wether to tell his boys to mow down more hay for the morrow or to stop cutting and hustle that which was curing in the mow.

A REAL "BROTHER"

Dear Mr. Editor: Enclosed please find one dollar for which enter my brother's name on your list for one year along with my renewal for one year. I think it is a worthy little paper to be in the house as it gives good reading for all in the house and I know my brother will appreciate it very much.—C. C. McC., Petersburg, Mich.



"Seven and a half years' service —and still going strong"

IN Rummerfield, Pennsylvania, Mrs. Boyle runs a dairy farm with the help of one steady man and a Hercules Engine. The herd consists of from twenty-five to thirty cows and she says that one man can do the milking in two hours. Here is an extract from her letter:

"Our 1½ H. P. Hercules Engine has spent seven and one-half years running a five-single-unit milker. . . . I could not speak too highly of the engine, as it has been run by all sorts of help. The cost of operating and repairs has been a very small item. 5000 hours would not cover the running time of this little servant."

Mrs. Boyle's farm is one of more than three hundred and fifty thousand where the Hercules is bearing the brunt of the hard work—doing the milking, running the dairy, grinding feed, running the washing-machine, the workshop, the water-pump, the grindstone—doing the thousand and one things that must be done and that are downright hard work.

A boy can run a Hercules. It starts easily, winter or summer. *And sticks to the job till it's done.*

Operating costs are surprisingly low. One Hercules owner wrote us that his engine "pays for itself three times every year."

There is a Hercules for your farm. They range in size from 1½ H. P. to 12 H. P. Back of every one of them is the five-year guarantee of The Hercules Corporation.

There should be a Hercules dealer near you. If there isn't, drop us a postal. Let us show you how you can lighten the burden of work on *your* farm. An inquiry puts you under no obligation.

ELECTRICITY from the WIND!

A complete electric light plant that generates current by wind power alone. AEROLECTRIC — invented and perfected by Perkins —a leader for 60 years in windmill manufacturing.

FREE Fuel!

Consider this! From the AEROLECTRIC you get all the "juice" you want for light and power and it doesn't cost you a cent for fuel. Wind is as free as the air you breathe and there is no engine to fuss with and care for.

AEROLECTRIC

Current for 11 days without wind

No fear of wind shortage with the AEROLECTRIC. Charges on faintest breeze, as low as 6 miles an hour. Big batteries have ample storage for enough "juice" to last 11 days even if no wind blew for that length of time. And the government says this never happens.

AEROLECTRIC has 14 ft. Perkins Wind Wheel with a Westinghouse Generator built in. Hyatt Roller Bearings and finest equipment throughout. Current is carried along a wire to the batteries where it is ready for instant use for either light or power at the touch of a button and at no expense. Aerolectric completely installed for $800 plus freight. Insurance Policy FREE insuring against wind blowing mill down.

Rheumatism
A Remarkable Home Treatment Given by One Who Had It

In the year 1893 I was attacked by Muscular and Sub-Acute Rheumatism. I suffered as only those who are thus afflicted know for over three years. I tried remedy after remedy, but such relief as I obtained was only temporary. Finally, I found a treatment that cured me completely and such a pitiful condition has never returned. I have given it to a number who were terribly afflicted, even bedridden, some of them seventy to eighty years old, and the results were the same as in my own case.

I want every sufferer from any form of muscular and sub-acute (swelling at the joints) rheumatism to try the great value of my improved "Home Treatment" for its remarkable healing power. Don't send a cent; simply mail your name and address, and I will send it free to try. After you have used it, and it has proven itself to be that long-looked for means of getting rid of such forms of rheumatism, you may send the price of it, One Dollar, but understand I do not want your money unless you are perfectly satisfied to send it. Isn't that fair? Why suffer any longer, when relief is thus offered you free. Don't delay. Write today.

(Copyright by James Oliver Curwood

SYNOPSIS

JOANNE GRAY is one of the passengers on the train bound for Tete Jaune Cache, the home of "The Horde," where she has no friends and all will be strange to her. The train stops at a town composed of several tents, she goes in search of food and a bath. She is directed to "Bill's Shack" and here she meets Bill Quade, who not only owns and operates "Bill's Shack" but is also leader of the lawless men of the town. Quade says he has a room she can rent and that he will show it to her. As they pass out of the room a newcomer enters the doorway leading off the street. The newcomer is John Aldous, a well known novelist. He sees the strange girl enter the place and believes she has made a mistake and as he stands in the doorway his eyes rest upon the curtained doorway through which they have passed. In but a moment the girl steps out, face flaming and eyes flashing. Quade follows her apologetically. He starts to offer the girl money but before he can do so Aldous steps to the girl's side and floors Quade with a terrific blow. Aldous hurries the girl away from the scene to the home of friends. Joanne tells Aldous she is going to Tete Jaune to find her husband, Mortimer FitzHugh. Aldous decides to go with her to protect her from Quade and his partner Culver Rann. Aldous believes FitzHugh is dead and locates a friend who declares he has seen the grave. Upon their arrival at Tete Jaune they are met by friends of Aldous, the Blacktons, at whose place they are to stay during their stop. Later they secure horses and supplies and start off into the wilderness accompanied by Donald MacDonald, a friend of Aldous. They locate the grave and return to the Blacktons.

(Continued from March 3 Issue)

FOR a moment Joanne stood facing the little lake, and when she spoke again there was a note of thankfulness, of subdued joy and triumpt in her voice.

"Before that day had ended I had displeased Mortimer FitzHugh," she said, and Aldous saw the fingers of her hands close tightly. "I told him that until a month had passed I would not live with him as a wife lives with her husband. And he was displeased. And my father was not yet buried! I was shocked. My soul revolted.

"We went to London and I was made welcome in the older FitzHugh's wifeless home, and the papers told of our wedding. And two days later there came from Devonshire a woman a sweet-faced little woman with sick, haunted eyes; in her arms she brought a baby; and that baby was Mortimer FitzHugh's!

"We confronted him—the mother, the baby, and I; and then I knew that he was a fiend. And his father was a fiend. They offered to buy the woman off, to support her and the child, They told me that many English gentlemen had made mistakes like this, and that it was nothing—that is was quite common. Mortimer FitzHugh had never touched me with his lips, and now, when he came to touch me with his hands, I struck him. It was a serpent's house, and I left it.

"My father had left me a comfortable fortune, and I went into a house of my own. Day after day they came to me, and I knew that they feared I was going to secure a divorce. During the six months that followed I learned other things about the man who was legally my husband. He was everything that was vile. Brazenly he went into public places with women of dishonour, and I hid my face in shame.

"His father died, and for a time Mortimer FitzHugh became one of the talked-about spendthrifts of London. Swiftly he gambled and dissipated himself into comparative poverty. And now, learning that I would not get a divorce, he began to regard me as a slave in chains. I remembered, one time, that he succeeded in laying his hands on me, and they were like the touch of things that were slimy and poisonous. He laughed at my revulsion. He demanded money of me, and to keep him away from me I gave it to him. Again and again he came for money; I suffered as I cannot tell you, but never once in my misery did I weaken in my promise to my father and to myself. But—at last—I ran away.

"I went to Egypt, and then to India. A year later I learned that Mortimer FitzHugh had gone to America, and I returned to London. For two years I heard nothing of him; but day and night I lived in fear and dread. And then came the news that he had died, as you read in the newspaper clipping. I was free! For a year I believed that; and then, like a shock that had come to destroy me, I was told that he was not dead but that he was alive, and in a place called Tete Jaune Cache, in British Columbia. I could not live in the terrible suspense that followed. I determined to find out for myself if he was alive or dead. He is down there—dead. And I am glad that he is dead!"

"And if he was not dead," said Aldous quietly, "I would kill him!"

He could find nothing more to say than that. He dared trust himself no further, and in silence he held out his hands, and for a moment Joanne gave him her own. Then she withdrew them, and with a little gesture, and the smile which he loved to see trembling about her mouth, she said:

"Donald will think this is scandalous. We must go back and apologize!"

She led him down the slope, and her face filled with the pink flush of a wild rose when she ran up to Donald, and asked him to help her into her saddle. John Aldous rode like one in a dream as they went back into the valley, for with each minute that passed Joanne seemed more and more to him like a beautiful bird that had escaped from its prison-cage, and in him mind and soul were absorbed in the wonder of it and in his own rejoicing. She was free, and in her freedom she was happy!

Free! It was that thought that pounded steadily in his brain. He forgot Quade, and Culver Rann, and the gold: he forgot his own danger, his own work, almost his own existence. Of a sudden the world had become infinitesimally small for him, and all he could see was the soft shimmer of Joanne's hair in the sun, the wonder of her face, the marvellous blue of her eyes—and all he could hear was the sweet thrill of her voice when she spoke to him or old Donald, and when, now and then, soft laughter trembled on her lips in her sheer joy of the life that had dawned anew for her this day.

They stopped for dinner, and then went on over the range and down into the valley where lay Tete Jaune. And all this time he fought to keep from flaming in his own face the desire that was like a hot fire within him—the desire to go to Joanne and tell her that he loved her as he had never dreamed it possible for love to exist in the whole wide world. He knew that to surrender to that desire in this hour would be something of a sacrilege. He did not guess that Joanne saw his struggle, that even old MacDonald mumbled low words in his beard. When they came at last to Blackton's bungalow he thought that he had kept this thing from her, and he did not see—and would not have understood if he had seen—the wonderful and mysterious glow in Joanne's eyes when she kissed Peggy Blackton.

Blackton had come in from the work-end, dust-covered and jubilant.

"I'm glad you folks have returned," he cried, beaming with enthusiasm as he gripped Aldous by the hand. "The last rock is packed, and tonight we're going to shake the earth. We're going to blow up Coyote Number Twenty-seven, and you won't forget the sight as long as you live!"

Not until Joanne had disappeared into the house with Peggy Blackton did Aldous feel that he had descended firmly upon his feet once more into a matter-of-fact world. MacDonald was waiting for the horses, and Blackton was pointing over toward the steel workers, and saying something about ten thousand pounds of black powder and dynamite and a mountain that had stood a million years and was going to be blown up that night.

"It's the best bit of work I've ever done, Aldous—that and Coyote Number Twenty-eight. Peggy was going to touch the electric button to Twenty-seven to-night, but we've decided to let Miss Gray do that, and Peggy will fire Twenty-eight to-morrow night. Twenty-eight is almost ready. If you say so, the bunch of us will go over and see it in the morning. Mebby Miss Gray would like to see for herself that a coyote isn't only an animal with a bushy tail, but a cavern dug into rock an' filled with enough explosives to play high jinks with all the navies in the world if they happened to be on hand at the

"Fine!" said Aldous.

"And Peggy wants me to say that it's a matter of only common every-day decency on your part to make yourself our guest while here," added the contractor, stuffing his pipe. "We've got plenty of room, enough to eat and a comfortable bed for you. You're going to be polite enough to accept, aren't you?"

"With all my heart," exclaimed Aldous, his blood tingling at the thought of being near Joanne. "I've got some business with MacDonald and as soon as that's over I'll domicile myself here. It's bully of you, Blackton! You know——"

"Why, dammit, of course I know!" chuckled Blackton, lighting his pipe. "Can't I see Aldous? D'ye think I'm blind? I was just as gone over Peggy before I married her. Fact is, I haven't got over it yet—and never will. I come up from the work four times a day regular to see her, and if I don't come up I have to send up word I'm safe. Peggy saw it first. She said it was a shame to put you off in that cabin with Miss Gray away up here. I don't want to stick my nose in your business, old man, but—by George!—I congratulate you! I've only seen one lovlier woman in my life, and that's Peggy."

He thrust out a hand and pumped his friends limp arm, and Aldous felt himself growing suddenly warm under the other's chuckling gaze.

"For goodness sake don't say anything, or act anything, old man," he pleaded. "I'm—just—hoping."

Blackton nodded with prodigious understanding in his eyes.

"Come along when you get through with MacDonald," he said. "I'm going in and clean up for to-night's fireworks."

A question was in Aldous' mind, but he did not put it in words. He wanted to know about Quade and Culver Rann.

"Blackton is such a ridiculously forgetful fellow at times that I don't want to rouse his alarm," he said to MacDonald as they were riding toward the corral a few minutes later. "He might let something out to Joanne and his wife, and I've got reasons, Mac—for keeping this affair as quiet as possible. We'll have to discover what Rann and Quade are doing ourselves."

MacDonald edged his horse in nearer to Aldous.

"See here, Johnny, boy—tell me what's in your mind?"

Aldous looked into the grizzled face, and there was something in the glow of the old mountaineer's eyes that made him think of a father.

"You know, Mac."

Old Donald nodded.

"Yes, I guess I do, Johnny," he said in a low voice. "You think of Mis' Joanne as I used to—to—think of her. I guess I know. But—what you goin' to do?"

Aldous shook his head, and for the first time that afternoon a look of uneasiness and gloom overspread his face.

"I don't know, Mac. I'm not ashamed to tell you. I love her. If she were to pass out of my life to-morrow I would ask for something that belonged to her, and the spirit of her would live in it for me until I died. That's how I care, Mac. It wouldn't be the square thing. And yet she won't remain in Tete Jaune very long. Her mission is accomplished. And if—if she goes I can't very well follow her, can I, Mac?"

For a space old Donald was silent. Then he said, "You're thinkin' of me, Johnny, an' what we was planning on?"

"Partly."

"Then don't any more. I'll stick to you, an' we'll stick to her. Only"

"What?"

"If you could get Peggy Blackton to help you——"

"You mean——" began Aldous eagerly.

"That if Peggy Blackton got her to stay for a week—mebby ten days—visitin' her, you know, it would'nt be so bad if you told her then, would it, Johnny?"

"By George, it wouldn't!"

"Yes——"

"Bein' an old man, an' seein' mebby what you don't see——"

"Yes——"

"That she'd take you, Johnny."

In his breast John's heart seemed suddenly to give a jump that choked him. And while he stared ahead old Donald went on.

"I've seen it afore' in a pair of eyes just like her eyes, Johnny—so soft an' deeplike, like the sky up there when the sun's in it. I seen it when we was ridin' behind an' she looked ahead at you, Johnny. I did. An' I've seen it afore. An I think——"

Aldous waited, his heart-strings ready to snap.

"An' I think—she likes you a great deal, Johnny."

Aldous reached over and gripped MacDonald's hand.

"The good Lord bless you, Donald! We'll stick! As for Quade and Culver Rann——"

"I've been thinkin' of them," interrupted MacDonald. "You haven't got time to waste on them, Johnny. Leave 'em to me. If it's only a week you've got to be close an' near by Mis' Joanne. I'll find out what Quade an' Rann are doing, and what they're goin' to do. I've got a scheme. Will you leave 'em to me?"

Aldous nodded, and in the same breath informed MacDonald of Peggy Blackton's invitation. The old hunter chuckled exultantly. He stopped his horse, and Aldous halted.

"It's workin' out fine, Johnny!" he exclaimed. "There ain't no need of you goin' any further. We understand each other, and there ain't nothin' for you to do at the corral. Jump off your horse and go back. If I want you I'll come to the Blackton's 'r send word, and if you want me I'll be at the corral or the camp in the coulee. Jump off, Johnny!"

Without further urging Aldous dismounted. They shook hands again, and MacDonald drove ahead of him the saddled horses and the pack. And as Aldous turned back toward the bungalow old Donald was mumbling low in his beard again, "God ha' mercy on me, but I'm doin' it for her an' Johnny—for her an' Johnny!"

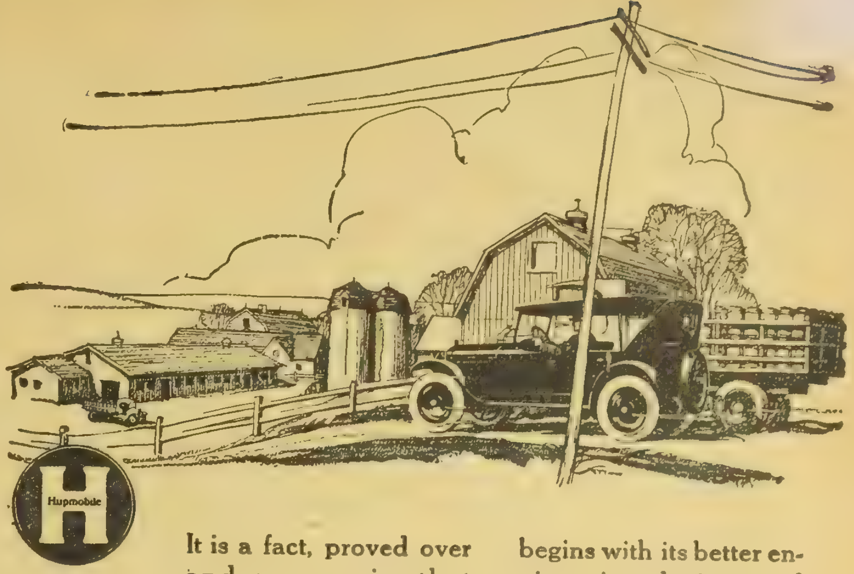
(Continued March 31st issue)

UGANDA CATTLE AID TO MATRIMONY

SINCE the earliest days in the Uganda territory of Africa, the measure of wealth of the various tribes have been the number of domestic animals owned. Practically all of the live stock in the territory is owned and raised by natives. Animals constitute the natives bank accounts and chief trading assets. Even since the introduction of coins, animals form an important medium of exchange and in some parts of the colony one cow may be owned by several people, says a report from Consul William L. Jenkins, Nairobi, to the Department of Commerce. According to official figures for 1921 the cattle in that country numbered 680,764, while there were 632,206 goats and 221,524 sheep, with the exception of certain provinces from which no statistics could be received. It is believed, however, that the cattle population of the Protectorate is about one million. Family life is still dependent upon the ability of young men to acquire the number of animals demanded by his prospective father-in-law. These young men are often-times up against it, because the country is very susceptable to cattle diseases.

"Without my hogs," said Nathan Boggs,
"I surely would be lost;
My nice purebreds, both blacks and reds,
Bring in twice what they cost."

I am taking advantage of your offer to get something for nothing and am inclosing check for one dollar and coupon to renew subscription. We enjoy the paper and are interested in the letters concerning the schools and taxation especially as we are in a newly consolidated school and have had chicken-pox, whooping cough and pink eye, our doctor bill for same and one hundred dollars extra school tax besides the loss of sleep and damage to temper and expect to have the itch before spring. Wishing the paper success along with the farmer, I am.—Wm. A. Smith, Wexford County, Mich.



It is a fact, proved over and over again, that the Hupmobile costs less to maintain over a period of three years, or longer, than any other car built today.

Owners of passenger car fleets have demonstrated Hupmobile's unequalled economy beyond any possibility of doubt.

After experimenting with various cars, they have finally standardized upon the Hupmobile as giving lowest cost service in the long run.

There is no secret about Hupmobile economy. It begins with its better engineering design, and comes down to the fact that finer, more durable parts are used where wear and durability promote longer life and lower costs.

Most of these parts are concealed within the motor, transmission, or rear axle, where the average owner never sees them.

Any disinterested repair man will tell you, however, that, judged solely by the way it is built, the Hupmobile is really a fine car at a low price.

Touring Car, $1115; Roadster, $1115; Special Touring Car, $1215; Special Roadster, $1215; New Two-passenger Coupe, $1385; Four-passenger Coupe, $1535; Sedan, $1675. Cord tires on all models. Prices F. O. B. Detroit—Revenue Tax Extra

ONE DOLLAR PER YEAR

The date following your name on the address label shows when your subscription expires. In renewing kindly send this label to avoid mistakes. Remit by check, draft, money-order or registered letter; stamps and currency are at your risk. We acknowledge by first-class mail every dollar received.

Advertising Rates: 45c per agate line. 14 lines to the column inch, 772 lines to the page. Flat rates.

Live Stock and Auction Sale Advertising: We offer special low rates to reputable breeders of live stock and poultry; write us.

RELIABLE ADVERTISERS

We will not knowingly accept the advertising of any person or firm who we do not believe to be thoroughly honest and reliable. Should any reader have any cause for complaint against any advertiser in these columns, the publisher would appreciate an immediate letter bringing all facts to light. In every case when writing say: "I saw your advertisement in The Michigan Business Farmer!" It will guarantee honest dealing.

"The Farm Paper of Service"

ADJUST PRODUCTION TO DEMAND

"FARMERS have just as much right to organize to control their output as union labor has to organize for the purpose of shortening hours and increasing wages. They have as much right to cease production wholly or in part as union labor has to strike. It is no more wrong for farmers to reduce products when prices are below cost of production than it is for the United States Steel Corporation to cut pig iron production in half when prices are rapidly falling."—H. A. Wallace, in a recent address.

THE FARMER IS A BUSINESS MAN

REPORTS of the success met by the acreage men of the sugar factories in Michigan who have adopted the now famous "50-50" contract by which the farmer becomes a co-partner of the factory, in the profits derived from the manufacture and sale of beet sugar, seems to prove the fact which The Business Farmer has reiterated so many times; that the farmer is not afraid to take every risk which the business man in any other line will, if he is given an equal chance at the profits.

There is, of course, the possibility that everything possible will be done this fall by the manufacturers who have refused to enter into the growers contract, to discourage its further practice, even if they find it necessary to curtail their own profits by lowering the price of sugar to do it.

Let every grower who has signed the "50-50" contract, pledge himself to stand by the plan for three years—win or lose—if he will, we risk the prediction, that before the three years have elapsed, every manufacturer in Michigan will have offered the same or a more attractive proposition to the growers.

When you hear a man knocking the "50-50" contract, ask him how long he's been on the other fellows "pay-roll", its a safe bet he is there, one way or another!

NOW ADVISES PARTICIPATION IN LEAGUE

THEY do President Harding and the present Republican administration an injustice who seek to poke fun at the recent announcement that the president and Secretary Hughes are about to stump the country in favor of participation in the World Court of the League of Nations, as did Woodrow Wilson, only a few years back.

Better late than never! And far better for the United States, leader of civilization, that we accept our responsibility and contribute our strength to a plan which has for its foundation, at least, the abolishment of wholesale slaughter of human beings, in the avowed cause of patriotism, to settle disputes bteween nations.

What matters it now, if in the heat of partisan politics our eyes were clouded by the smoke screen of propaganda, three years ago? What matters it whether Democrat or Republican is to be given the credit of helping to form the League? What matters anything under Gods heaven, when the question is whether it is possible to prevent so fruitless a butchery of mothers sons, as we who live to-day have just witnessed!

Families live in peace, communities live in peace, states and provinces in peace, great nations with thousands of miles of boundary as witness the United States and Canada, live in peace, why cannot the nations on this old globe live in peace? But you say, families, communities, states and nations have disputes to settle—surely, but the individual who kills to settle a dispute is a murderer and the nation which kills to attain the same result is no less a murderer and should be so appraised in the eyes of the world.

That is the reason for the World Court and the League of Nations is simply the power, the police force, to enforce the mandates and the punishments prescribed by the court.

Let those who will scoff at President Harding and the apparent turn-about-face of his administration to the policies proposed by Woodrow Wilson, have their fling. As for The Business Farmer, although steadfast in our belief in the League of Nations, as the best step out of the pit-fall of future wars, we would rather see the United States go in whole-heartedly and with the unanimous approval of our people now, than three years ago, with the mind of the press and the public so divided.

It takes a braver man to admit he was wrong, than it does to fight blindly on, altho knowing he is wrong!

A WISE APPOINTMENT

PRESIDENT HARDING has appointed Charles Townsend, retiring senator from Michigan, to the chairmanship of the joint-committee which cooperates with the Canadian government in the control of interrelations between the two great nations of the North American continent.

The zealots who have fought and fostered the Great Lakes-to-Ocean plan, have thus taken new heart, because they believed the last election which deprived them of Senator Townsend as the leader in their fight, was a staggering blow to the rapid progress the plan had been making during the past few years.

The new position gives Mr. Townsend even a more direct point of advantage and citizens of Michigan and the whole northwest, who are so vitally concerned over the early consumation of this great project will commend the president on his wise selection and appointment.

COUNTERFEIT MONEY

THE secret service has very recently unearthed the most daring and extensive operations of counterfeiters ever discovered in the United States. The operations of this gang have extended from coast to coast and it has been in operation for almost six months unchecked, while the government slueths have been attempting to reach the master-minds behind the gigantic scheme. When the net was finally complete, a campaign of arrests was begun which is expected to enmesh a thousand persons, men and women in all parts of America.

Most of the money has been in large sized bills, principally of $20 denomination. A greater part of it was passed through the illicit whiskey ring, but naturally found its way into countless hands.

Sooner or later a part of this money will reach the rural districts, it therefore might not be bad advice to suggest, that you have your banker look over any considerable amount of currency you are receiving.

A "NEW" CONTINENT DISCOVERED

WHEN you hear the word "Africa", what springs up in your mind? Roaring lions, charging elephants, crouching tigers or boa constrictors hanging from trees ready to embrace you! Or should not one of these animals get you, from the rank jungle, hideously painted cannibals brandishing feathery shields and poisoned spears, leap forward to impale you for their evening meal!

Is that your Africa? We confess that it was ours until the very recent few weeks while we have been following the traveler Newman from Cape Town to Cario, which would be somewhat similar to traveling from Panama to Hudson Bay in our own continent.

From the spot where Stanley found Livingstone, then in the midst of a wilderness as you remember it described in your geagraphy, motion pictures (which cannot lie or exaggerate as the Marco Polo's of old were inclined) show a railway station, giant steamships and in the back-ground the tall stacks of the copper mining companies.

Copper, gold, zinc, tin, and radium mines that will rival the better known diamond fields further to the south, in their output of wealth, now are developing the heart of Africa. The fierce cannibal tribes of Stanley's time, have been converted into sober workers who listen for the factory whistle, come home to eat baked beans canned in America and go in the evening to laugh at the antics of Charley Chaplin on the silver screen!

That is Africa—central Africa—today, as the pictures prove it.

Millions of acres of fertile prairie, that have never felt the scratch of plow; billions of feet of fine lumber, from mahogany to teak-wood; enough coal to heat the world for a thousand years; water-power, unharnesses that could do the work of the world!

What open space for the teeming millions of China, India, Japan and Europe to migrate to and bring into productiveness. Here is a great continent, once the very cradle of civilization, which is almost as undeveloped to-day as was North America, before the war of the Revolution.

It may occur to you, too, as you read this that some of our allies in the great war, knew something of all this when they divided up German South Africa among themselves. The land Belgium acquired in Africa is twenty times the area of the mother country in Europe. The copper mines which Great Britain acquired will produce probably more than all of the copper mines in America combined, and at a cost of production which may threaten our own copper in the worlds market.

Africa beckons to the adventurous youth of the world, as once did America, and the same type of sturdy pioneers are hearing her call.

STATE INSTRUCTION FOR MOTHERS

WHEN you know that 145 babies out of every thousand born in one county in in Michigan died at birth last year, you will know why the women leaders in Michigan are backing the Bohn bill, which ratifies the acceptance by the state of the funds provided from the national treasury by the Sheppard-Towner act, for the purpose of instructing prospective mothers.

If the bill passes the state will contribute $29,000 which will be met with a similar sum from the national treasury. In every county in Michigan one or more nurses will be provided to help lower the mother and child death-rate.

If there is any possible way in which the state and nation can repay the mother for risking her life to furnish its life-blood, then let that means to be speedily provided regardless of the cost. There is a time when dollars lose their significance only as a means to an end. This is one of the times!

THE "HIRED" HELP

HAVE you, father, ever been called a "hired man"? Or have you, mother, ever came suddenly into the dining room to hear your mistress telling her guests that you were their "new hired girl"?

If you have ever worked in either capacity for someone else, this little message will not be intended for you. It will not be necessary to remind you of the sting which these seemingly simple words have when they come to your ears for the first time, and you realize that you are a "hired man" or a "hired girl".

This message is to the mothers and fathers of growing children, who are in circumstances which permit them to employ extra help on their farm, whether in the home or in the fields. It is a plea for the abolition of the hated words "hired man" and "hired girl" from the vocabulary of every farm home.

Learn to speak of your employed help as your "assistants"—explain it to your children that the work is too heavy for mother or father and that "John" or "Clara", have come to assist you with your work. Teach your children to respect those who are helping you and you will be surprised at the result.

In the first place, you will find it easy to keep better employees. There is something so un-American and akin to slavery, about the hated terms "hired man", "hired girl", or "servant" that no intelligent and self-respecting American will remain in a place where it or the attitude which means the same thing are continually expressed in word or action.

There are no "servants" in America, thank God! Servant, means servile, and we free citizens of this great republic, all of us, except the parasite and the loafer, are all helpers, cooperating, assisting one another; no matter what our position be in societies stratas.

The Agricultural & Business Survey, appears again this issue on page 29, it shows the trend of change in every phase of business or finance which reflects on agriculture. It looks like a lot of figures that you want to miss, but once you find out how much information it contains, you would not miss it for a farm! The sweetest meat is always in the nut that is hardest to crack!

The best thing about hearing a political speech over the radio is that you can shut it off!

PUBLISHER'S DESK

WARREN McRAE FARM AGENCY

We assume that by this time our friend, McRae, the philanthropic farm agent at Logansport, Ind., has joined the ranks of those who are not particularly fond of The Business Farmer. It is lucky that we do not reach every farm home in Michigan or Mr. McRae would have to change some of his tactics in getting farms to sell.

Since our exposition of his letters and methods in the February 17th issue we have had any number of letters from our readers, not all of whom paid the ten dollars, but all of whom got similar letters to those we published in that issue.

The one that interests us most and should encourage those who have paid Mr. McRae his listing fee, whether $10 or $2, is one dated September 21st., 1922, and addressed to a reader at Cloverdale, Mich., which contains the following paragraph:

> If you are looking for a good quick cash sale, kindly fill out the enclosed listing form and return it to me with the regular listing fee of $10.00 and **I will guarantee to furnish you with a buyer for your property at your price and terms within 90 days or I will return your $10.00 in full.** When the deal is closed you pay me 2 per cent commission of the selling price. In case the first buyer does not buy notify me and I will keep on sending you buyers until you make a deal.

If Mr. McRae will make this proposition to every reader who has a farm for sale and will prove to us that he will return the listing fee, if he has not sent a buyer for the farm within 90 days, we will agree that his proposition is perfectly legitimate and he has only erred in the manner in which he has presented it.

It seems a little strange however, that in the many form letters, most of them dated later than the one quoted above, we have seen no mention of this very important "sell-your-farm-or-money-back" guarantee.

* * * *

"We are subscribers to your paper and we, too, got a letter from Warren McRae. He ran an ad. in the Allegan News for a few weeks and we were thinking of selling our place so I told my husband that I would answer the ad thinking that it was a man that wanted a small farm in Mich. and I enclosed an envelope addressed with 2c stamp for reply but instead in a few days we got a letter and some papers to fill and if we would send $10 he would send a buyer and if the first didn't buy he would keep sending until our place was sold and then he would return our $10.00. The letter was similiar to the one you printed in the paper but we didn't answer and in a few days we got another letter stating that for a limited time he would reduce it to $5.00. He is very generous but I think he didn't get any one around Allegan county and we are sorry for that widow woman that sent her money to him, because it is doubtful if she ever gets it. I see in the Grand Rapids Press that he is running an adv in it for Kent county. I hope nobody falls for him. All we are out is the 2c stamp and I am sorry he got that much. Such people should be punished.—Mrs. J. H. P., Allegan Co., Mich.

POOR HENRY!

Few days pass but what The Business Farmer receives a letter from some reader who wants to put a proposition up to Mr. Henry Ford. It may be like the one before me, a farmer who owns sixty acres on which he has been paying taxes for years, up in the Minnesota iron ore country. It lies in between the property of a great mining company. Our reader claims it has been illegally lumbered over and now he is afraid the mining company is going to take out the ore from beneath his land! That's being attacked from above and below, we should say.

Where can our reader turn for advice? He comes to us. Where can he get help to fight the gigantic financial groupe that is robbing him of his heritage? From Henry Ford, of course! He makes enough millions while his eyes are closed in slumber to relieve half of the financial worries that beset the poor folk.

So they come. But, we have to advise that about the hardest man in the civilized world to reach with any proposition, philantrophic or business, is our worthy neighbor at Dearborn. His personal mail is larger, 'tis said, and his staff of personal secretaries busier than that of the president of the United States.

Mr. Ford is a plain man, very human, emotional and extremely modest. Yet he represents a mass of worldly wealth which attracts to Dearborn the dreamers and the schemers from every corner of the world. Probably most of them are honest in their purpose, but it still remains, that all of them come to get some part of that pile of gold, whether their desire be for much or little of it.

They used to say that "everybody sometime in a lifetime has an overwhelming desire to write a book," now if this old saw were changed to "everybody some time in a lifetime wants to put a proposition up to Henry Ford" it would be more truthfully a statement of fact.

TAXES $120 IN 1905, JUMP TO $602 IN 1921.

(Continued from Page 3)

a club at every turn, the State Income Tax, would have helped, but met defeat last fall. A tax on gasoline would also bring some relief, but some of the city auto clubs, object because the farmers use it to run their farm machinery, (however I never talked with any farmer who objected). Then some propose to tax the weight higher, this plan has met with the objection that the rich cannot sell their old cars to the poor as they could not pay the tax, and it would not be just to tax an old worn our car with such high tax. Another wants a poll tax of $5, on each voter, I would be glad to see them all passed in order to get something out of those who are now paying no tax, but have full use of our roads and schools.

Our large manufacturing cities where wealth is concentrated, are paying millions of dollars in large salaries to people who pay no taxes, but who own and operate large and expensive cars and the tax on real estate must build their roads and schools for their children, they rent city homes, and the city land lord gets back at them for his high tax by boosting his rents. The farmer has no way of getting back at any one.

There is only one way to help the farmer, that is to relieve him of some of the burden he is now bearing in heavy taxes, and until our national government takes over the roads, our state should take some action at once. There is a way to relieve the real estate tax, which no honest person can object to. Put a tax of 4 per cent on the selling price of all autoes trucks and vans of all kinds as well as on motor cycles. etc. This on the selling price when new, then make a reduction of 10 per cent for depreciation for each year the vehicle is run, for five years, after that tax it for 50 per cent of its value new as long as it is run. This 4 per cent could be increased or decreased as the times may require, but at present some of the real estate is paying 7 per cent on an inflated valuation set by out State Tax Commission at a time that was pre-mature for such an act, and he is not allowed 10 per cent on his property each year for depreciation. The government is offering him a Federal Loan, but that is like knocking a person in the head with a club and then selling him a plaster.

The only relief to any one staggering under a heavy load is take part of the load from him. Remember the laws of Confusius, "The Strong must help the weak bear their heavy burdens." Yours for a good and honest Government.—Ed C. Allen, Osceola County, Mich.

President Harding broke White House records of several months standing when he shook hands with 1,450 persons in a recent reception.

FIRST JOINT STOCK LAND BANK OF CLEVELAND
Guardian Building, Cleveland, Ohio

Planter Profits

AFTER you have spent weeks behind the plow, the disk, and the harrow—after your fields have been worked down to a perfect seed bed—then comes the time to make planter profits. Big yields are largely the result of perfect planting—every hill in its place and every hill a full hill. Year after year the profits of good planting follow

International and C B & Q Corn Planters

They plant accurately and evenly whether set for checking, drilling or power drop. Without stopping the team the variable clutch can be set to plant 2, 3, or 4 kernels to the hill. Edge, flat, and full hill plates interchange in the same hopper. The automatic markers require no attention. Valve mechanism is so carefully fitted and so accurately timed that missing and stringing are entirely eliminated.

The tongue adjustment for leveling the boots insures an even cross check. Fertilizer attachments always available.

This year, pocket the profits of good planting by using an International or C B & Q Corn Planter.

What the Neighbors Say

MISSES SERMON

DEAR Editor: We have been reading M. B. F. for two years and like it very much, we find lots of information in it too. The only thing we miss is a scripture text, Sermon. We out here in the woods feel rather lonesome on account of not having church preveliges.

In reading our M. B. F. we also enjoy "What the Neighbors Say" and it is indeed a pitty that we as people of our good America can not cooperate together. Where is the democracy of our good U. S. A. going to? Our Government is ever ready to fix a price on Farmers Products, as during the war to cut the high cost of living, but the consumer had to pay very near the same old price for his flour as before. Now today the farmer has to sell his stuff at a sacrifice, but who is gaining by it; surely not the consumer? For instance, cattle that farmers sell, from 3 to 6 cents per pound, how much do consumers in cities pay for their beef in butchershops? Who gets the profit, surely not the farmer and the consumer!

Why can't we see the pure fabric law passed? The "all-wool" garments we buy nowadays don't last at all, the best that can be made out of pure virgin wool would be none too good for the consumer. Had ought to pass by all means.

Now they talk of reducing the taxes, but we farmers have to pay more every year, how about it? Our government should adopt "Single Tax" (Canadian style) so farmers would not have to pay a "fine" every time they improve their Farms. Farmers are all anxious to sell out and move to the city. The boys have gone already, who is going to product the nation's grub in the future under such conditions if this city move can not be stopped? Why can we as a nation not take an example from Europe? It has gone to the dogs just because of oppressing the poor. We read in Luke 13:1-3, "There were present at that season some that told Him of the Galleans, whose blood Pilate had mingled with their sacrifices * * * and Jesus answering said unto them, 'Suppose ye that these Galileans were sinners above all Galileans, because they suffered such things? I tell you nay; but except ye repent, ye shall all likewise perish.' " The judgement of God has come upon the old countries, and will unfailingly come upon us unless, we repent. The heavy tax burdens have to go or we farmers of America will not much longer be able to produce stuff to live. May God guide our leaders and keep our country from disaster. If not, judgement will come as we read in James 5:1-6, "Go now, ye rich men, weep and howl for your miseries that shall come upon you. Your riches are corrupted and your garments are moth-eaten. Your gold and silver is cankered; and the rust of them shall be a witness against you, and shall eat your flesh as it were fire. Ye have heaped treasurer together for the last days behold, the hire of the laborers who have reaped down your fields, which is of you kept back by fraud, crieth; and the cries of them which have reaped are entered into the ears of the Lord of Sabaoth. Ye have lived in pleasure on the earth and been wanton; ye have nourished your hearts, as in a day of slaughter. Ye have condemned and killed the just; and he does not resist you." We have felt it our duty to write these words, may the Lord bless them to his glory.—C. S., Oscoda County.

STAND UP FOR HER RIGHTS

I THINK a great deal of your paper and I read it carefully each week. Several weeks ago on the "What the Neighbors Say" page I read the piece written by Mrs. R. B., Ohio, and I can't resist writing a few lines in answer to it. I really pity her.

I don't believe in the women voting and I do not vote. I feel that is for the men, but I do believe in "personal freedom." I must say I think Mrs. R. B. has just lost out and right now if she takes my advice she will turn a new leaf, tell Mr. R. B. that she has served her time as a servant in her own house and now she will manage it to suit herself, do her work just to suit herself. She sure must know how by now, after being told for 16 years, that she will relive him of the duty to see to it, also from now on to use her own butter and cream money also egg money as she see fit. Tell him kindly but firmly and plainly that she means it and stick to it. It may not be pleasant for her for a time, but she can win out if she has the grit. Do not quarrel with him or have any angry words. Kindly tell him just what is what and mean it too.

The very idea of his buying her dresses. Does she buy machinery for him? Oh no, of course not, she doesn't know what kind he likes best. He may try a new kind next time. How about the dresses, she might like a change too and surely the liberty of getting just what you want and being suited is worth a lot, and if ever you have any rights while you are young enough to enjoy them and use them the time is right now. What they have earned together is hers as much as his. Suppose she, not being used to having her own money, does make a few mistakes in buying. He, I know, has not always hit the market just right. It is worth something to try and to feel you really live and not just simply exist. Get your nerve up and stand up for yourself, don't cry or scold. He will honor you twice as much for being his equal.

Now as to a way to go to church. Are not the horses as much hers as his? I say yes. Tell him you want one to drive and have it, or if you can't, just hire someone to take you and let him pay the bill a few times. He will soon see it is cheaper and sounds better to take you yourself.

Now I am a farmer's wife have always lived on a farm. I have been married 24 years. We always talk things over and work together. I have never asked for a horse and been refused, but I never ask when I know they are busy; in fact I have a horse of my own. He always works my horse and I never interfere but when I need him I say so. I always sell my eggs and cream and we use the money the same as when he sells grain or stock. If he did not then I would keep the egg and butter money for my own self but I think it better to work together, but equal rights I shall have.

I have always worked in the field and do yet. I do not believe in either one being the boss. I have no children. He goes where he likes to sales, all men enjoy them. I go where I wish. We do not always think alike—far from it—but we compromise and I think any man thinks more of his wife if he understands she is his equal.

I do not belive in parting or divorces but can say Mr. R. B. should have changed his ways long ago. If he loves her as he should the mother of his children he will see his mistake and gladly make right the wrong she has endured. If not, quit. The world is wide and there is room for us all. The days of tyranny are past. What good time is she having, to alawys live on an uncertainity, never know whether she can go anywhere or do anything unless he says so. This is what I think. What do the other readers say?—"Mollie Brown," Michigan.

THE FARMERS' TROUBLE—OVERPRODUCTION

THE woes of our farmers are chiefly due to the same cause that has deranged our coal mining industry. To many are in the game, causing overproduction. The great rise in the price of land, which has doubled, and in some cases trebled and quadrupled, in the last ten years, proves this. If the poor and remote farms and mines (which comprise over one-fifth of the total) were abandoned, it would encourage the others to produce to capacity, insuring bigger crops at lower cost, and it would release a lot of first class labor to other industries. Farmers, instead of deploring should welcome every increase of wages in other occupations, as it decreases the number

(Continued on Page 19)

The Remarkable Growth of Fur Farming

BY DR. C. B. SHORE

SINCE the creation of the world and man's inhabitance upon the earth, the first clothing worn was that of furs. Man's first choice of wearing appearel has been passed down through generations and has been in continuous use by all nations and peoples.

Since the rapid advance of civilization, those wild animals that bear suitable furs for wearing purposes, are very fast becoming extinct, and today the trapper must of necessity, look elsewhere for profitable income. Furs of all species are in constant demand throughout the whole world.

I believe no other industry in this Northwest country promises such profitable returns as may be realized from the domestication of fur bearing animals.

I shall speak principally of the domestication and production of the standard bred silver fox fur. This fur, exclusive of the Russian sable, which cannot successfully be raised in the United States, is of a distinctive class, and cannot be successfully imitated. For this reason its pelt is capable of procuring very profitable results for the rancher.

Silver and black foxes are classified into four distinct types, depending on the quantity of silver tipped guard hairs present in the pelt. The classes are designated as black, dark silver, medium silver and light silver. All types are necessary on the average ranch. The demand at present is for dark and medium pelts and these are produced largely by mating black animals with light silvers. Much care and thought is given to the mapping out of a definite breeding program on the large ranches.

Most of the northern states are admirably adapted for fox raising. The humid, cool atmosphere in the northern states makes a dense, dark pelage on fur animals that always commands top prices in the fur markets. In addition, the entire region possesses a wealth of lakes, marshes and rocky, hilly, timbered lands unfit for cultivation, but furnishing unequalled sites for the prospective fur farmer.

Early breeders thought that foxes would not do well in captivity unless ranched in secluded spots. This has been disproved by the phenomenal successes of American ranchers, most of whom operate in thickly settled communities. It would, of course be inadvisable to build a ranch immediately adjacent to a large factory along railroad or trolley tracks or in the heart of a city. Ranches may be built on the outskirts of villages and towns, along rural highways or within a reasonable distance of farm buildings without danger of creating unfavorable conditions.

The chosen ranch site should, first of all, be carefully considered from the drainage standpoint. Fox pens should be erected on a well-drained piece of high land. Foxes will not do well in a swampy hallow, where the soil stays damp for long periods. Disease breeds readily in damp locations of this character. Clay or heavy black loam top-soil should be avoided. If possible, choose a location with a clay subsoil and a gravel or sand top-soil.

Many ranchers make the mistake of placing too much stress on the shade requirements of a fox farm site. Proper soil and drainage are and should be foremost. Some of the most successful ranchers have discovered that foxes kept in pens erected in the open have been remarkably free from disease. This is undoubtedly due to the fact that disease germs cannot exist in soil subjest to the direct burning rays of the sun.

Considering the value of the animals, guard fences, pens and kennels are comparatively inexpensive. Frame works can be built of cheap lumber left in the rough or of the best, carefully fitted and painted. In building a large ranch it will pay to lessen depreciation by using high grade materials. Wire should always be the best obtainable.

The size and shape of breeding and rearing pens differ considerably according to the area and physical characteristics of the site. The dimensions of pens very from 90 feet in length by 30 feet in width to 30 feet in length by 10 feet in width. Height depends on the average snowfall. The pen should be high enough to permit an average sized man to walk around in same without stooping. Allowance must be made for depth of snow.

In some ranches pens are laid end to end and side by side across the ranch, pens and alleys detached or separated by alleys from two to ten feet in width.

A successful breeder has experimented with various types of fox kennels or dens. After giving them thorough and conscientious trials he has found that a simple double kennel with separate entrances will suffice. The remarkable record of 2 1-2 to 3 1-2 pups average to the pair on his ranches would indicate that his adopted style of kennel is far superior to any other.

His kennels are double walled and are placed on a block foundation two or three inches from the ground, thus insuring warmth and dryness. The roof is hinged and serves as a lid. The kennel is divided into two separate compartments with covered chute entrances approximately four feet long inclining from the kennel opening to the ground.

The breeding season on the fox ranch lasts from late January to March. The gestation period is approximately fifty-one days. This period, together with the early rearing or pupping season, constitutes the most critical time of the year on the fox ranch.

As a rule, the animals are monogamous, the dog rarely mating with more than one female. Segregated pairs must be carefully watched during the breeding season and if harmony does not prevail, the vixens are paired with new mates, the object being to produce a litter of fox puppies in every den if possible.

The litter ranges in numbers from one to nine, the average on many of the ranches being 2 1-2 to 3 1-2 which is remarkable. Males are left with the mother and young. They take care of their share of the parental duties and are absolutely necessary in the pen for the first few days after the young are born, as the vixen relies largely on her mate to carry food to her.

Fox puppies are blind for the first two weeks of their existance. They grow rapidly and usually appear outside the kennel when one month old. Within a short time they learn to lap milk from a basin and when two months old include solid foods in their diet. The mother fox will wean them when three months old. Fox puppies attain sufficient size and fuality of pelt by the first of December following the month in which they were born that they may be pelted at that time.

Even if the price of breeding stock be brought to one-half or less of its present level, and pelts bring only $100 apiece, there will be left enough profit to make the industry worth while.

An open invitation is extended by many breeders during the summer months, to visit their ranches. Some raise, besides hundreds of pairs of silver foxes, deer, buffalo, raccoon, wolves, different species of birds, and German police dogs.

"Everything comes to him who waits
But here is something slicker.
The man who goes after what he wants
Gets it a darn sight quicker."

CERTIFIED COLLEGE WONDER OATS. Purity 99.7%, germination 92, test weight 37 pounds. Write for prices. HOMER GOULETT, Kawkawlin, Michigan.

CERTIFIED WOLVERINE OATS—MICHIgan's leading variety. O. D. FINKBEINER, Greenwood Farm, Clinton, Mich.

GENERAL

LET US TAN YOUR HIDE—COW AND Horse hides for fur coats and robes. Cow and Steer hides into Harness or Sole Leather. Catalog on request. [illegible] worn furs; estimates furnished. THE CROSBY FRISIAN FUR CO., Rochester, N. Y.

FARMERS, BOOK-KEEPERS, STUDENTS, I can and will teach you in one minute's time the absolute proof of any sum in addition, also simplified methods in addition, division and mutliplication. Errors are costly, my method will eliminate them. Send $1 for the lessons, they cost me $100. Address G. H. HOLLISTER, Twining, Michigan.

WANTED—TO BUY BLACK PERCHERON Stallion or dark Belgian. What have you? C. M. CULBERT, D. V. S., Chesaning, Michigan.

The Children's Hour

DEAR Nieces and Nephews: Did you ever hear of a tree called the "cow tree?" There is such a tree and it grows in South America on the broad barren plateaus of Venezuela. The sap of this tree resembles milk both in taste and appearance, and, is not only wholesome but nourishing as well, according to naturalists who have examined it. It is said to be not very different from rich cream aside from a slight balsamic flavor. The trees often grow to a height of one hundred feet and have no branches within less than eighty feet of the ground. The bark of the tree is generally smooth. If a hole is bored or any sort of a wound made on the bark, the milk-like fluid will commence to flow and continue for days until it coagulates at the mouth of the wound and forms a waxy substance which prevents further flow. I would like to see one of these trees, wouldn't you?—UNCLE NED.

OUR GIRLS AND BOYS

Dear Uncle and Cousins: I wrote a letter last fall, and seeing it in print, I thought I would write again. When I wrote I ask the boys and girls to guess if I was a boy or a girl, by my name, Leslie. I said if they guessed correctly I would write them a long letter. I received about fifteen answers of which some were right and some were not. I am now corresponding with five or six of them. Well, as my friend and I want go skiing I will close with a few riddles. How many peas in a pint? Answer: One p. What is the commonest put-up job you know of? Answer: Paper on the wall. Why does a tall man eat less than a short one? Answer: Because he makes a little go a long way. What kind of a cape does a prisioner like best? Answer: Es cape. Where can all the words of our last foolish conversation be found? Answer: In a dictionary. Patch upon patch and has seams. Answer: Cabbage. Well I guess it is too late to go skiing now, so I guess I will close for sure. Your cousin and niece, Miss Leslie Hillard, Cadillac, Mich., R. No. 2, Box 69.

Dear Uncle Ned: I was out to my grandpa's Feb. 19th and got interested in reading the Children's Hour in M. B. F. This is the first time I have ever written you a letter. I am twelve years of age and in the sixth grade. I have six blocks to go to school and live right on the river bank. I have two sisters, one eleven years old and the other four years old. How many Valentines did you get? I got between one and twelve, and the one that guesses how many I got I will write a letter to. We just posted our Africa maps and are about to take up the study of Australia. My father is the general delivery groceryman in St. Louis. I use to live one a farm one mile and half west of Forrest Hill. We had sixty acres of land, and believe me we used to raise crops. We have a farm two miles south of Elm Hall now but I live in St. Louis. My dad has a different car or farm nearly every day. Well I guess I had better close for this time—Clayton J. Anderson, St. Louis, Michigan.

Dear Uncle Ned: I see by the M. B. F. that I am not the only silent reader of your paper. My father is a reader and subscriber of the M. B. F. and likes it real well, especially the article about Henry Ford. I thought I would write a few lines tonight as I just took a notion to write a letter. I just wonder if this letter will escape the waste basket. I don't see many letters in the M. B. F. from here. I am sweet sixteen, and have five sisters and one brother. I am the oldest and my youngest sister was a week old last Friday. The answer to the riddle of L. D. Biddle is, a flat iron. Say, I like the poem about "The Wood Box." I don't have to help carry in the wood but I have to help saw it and I don't like that very well. I haven't sawed any for over two weeks, on account I was sick a week and the other week I had to keep house. Say, Uncle Ned, I am not getting the spring fever but have already had it. Ha! Ha! Well, I guess I must close as this is getting to be a long letter. Best wishes to you and the cousins. Your niece, Miss Trecel Sweeney, Cadillac, Mich., R. R. No. 2.

Dear Uncle Ned: This is my first time writing to you I am a girl of 16, I'll be 17 May 20th. I have dark hair and eyes. I am five feet tall and have passed the 9th grade. I signed for the Michigan Business Farmer just last summer and I like it very much. I am writing to a girl in Lansing. I found her address in M. B. F. I like her very much. I will tell you her initials and if you guess her name I shall write another letter (E. P.) Will some of the nieces and nephews write me a letter, please? Your loving niece.—Louese Irene Barker, Route No. 3, Box 102, St. Louis, Mich.

Dear Uncle Ned: I have never written before. May I join your merry circle? I enjoy reading the letters in the Children's Hour. I am nine years of age and in the sixth grade at school. Well, I will tell you about our valentine day at school although my letter is a little late, the old saying is "better late than never." We had valentine cookies and pop corn. I got twenty-nine valentines and my brother got nine. We are writing a composition about George Washington. Who ever has the neatest one gets a prize. No one got the prize yet. Please, some of the girls and boys, write to me.—Ruth Pobanz, Owendale, Michigan, R2, Box 59.

Dear Uncle Ned: I have read the M. B. F. so long I thought I would write to you. I am 5 ft. 4 in. tall. I have a light complexion and brown hair and blue eyes. My age is between 12 and 16. Any one guessing my age will receive a nice long letter from me as I love to write letters. My birthday is on July 22. I live on a 160-acre farm. We have 8 cows, 2 pigs, 2 horses and 4 sheep. I have one sister and 3 brothers at home. My sister is 11. Her name is Amy. My oldest brother is 17. His name is Harold. One is 15. His name is Carl and the third one is 6 years old. His name is Leon Graves. Well, I guess this is enough for now, so will close with a few riddles. Why is a caterpillar like a pancake? Answer: Because its the grub that makes the butterfly. What is the key of good manners? Answer: B natural. See who can guess this one. Why is an important young lady like a music book? I will tell the answer in my next letter if no one guesses it. Will close hoping to hear from some of the boys and girls. Will answer everyone I can. I remain Your niece, Miss Marie Graves, R. 1, Box 88, Manton, Mich.

Dear Uncle Ned: I suppose you will be very much surprised to hear from me as I have not written for so long. I am a girl 14 years old and in the seventh grade at school. I go to the Greenwood school on the M-10 trunkline road. My father and mother take the M. B. F. and like it fine. I have one sister. Her name is Muriel. I live on a farm of 160 acres. We have 7 horses, 8 cows, 10 calves and 85 chickens. We have a thoroughbred Shorthorn Sire and 2 thoroughbred pigs and 7 little pigs. My daddy shipped two large pigs which weighed 620 pounds. I think that is pretty good for pigs at 7 months old. We have a creek that runs through our farm and in the winter it is covered with ice and my cousin comes over and goes skating with my sister and I. We go coasting down the hill in front of our house. My grandmother, who is a widow, is staying with us this winter. We girls like her to tell us stories about when she was young. For pets I have a cat named "Tetedils" and two kittens. I help my daddy milk and my sister washes the dishes for mother. It is pretty cold for me to go out to milk in the morning. If you guess my sister's age I will write you a long letter. She is between 9 and 13. Well I guess I will close wishing some of the boys and girls would write to me.—Leorna Brown, Tawas City, Mich., R. F. D.

UNCLE RUBE SPINACH SAYS

THE FOUR SEASONS.

WINTER, the time of year 'at most everybody dreads, is nearly past. In a few days it'll be spring. Spring is so beautiful an' lovely 'at everybody loves it. Flowers begin to bloom in springtime an' folks al'us say "Ah spring is the most beautiful time of the whole year." Mebbe 'tis, mebbe not, it's jest as we look at it, what makes it beautiful or not. The springtime sure is a lovely time. Summer comes right after the spring an' who can say 'at summer isn't a lovely time? An' then when Autumn comes—Oh Boy—she's a lovely time too. Leaves all turned to gold, walnuts an' hickory nuts fallin'—the season's comin' to an end when autumn comes. Spring, summer, fall an' winter—somehow you know I like 'em all. Sometimes I think spring best—young life jest startin' out—so it is with humanity. Springtime—time of love an' everything. Summer—gittin' together an' life is all lovely, green like the grass, flowers kinda growin every place—nothin quite like love in the summer time. An' then comes Autumn—leaves are turnin' yeller—golden they are an' in our lives we see life in a more serious form. Many of our young folks have decided to marry, now—good luck go with them, and may God help them. Well, alright—I like the season's jest as they come. I watch men as they go through the different stages—spring, fall, winter—an' all I see— men that have entered into the—well, we'll call it the winter of life—hair gray, mebbe white, no matter, they give up —the gray hair makes 'em old an' then they become just grouchy ol' cusses—you know what I mean? When a man begins to think winter has come into his life he's just 'bout all alone. An' I'm talkin' of women jest as much as I am of men. Women git old—they feel, talk, an' act old.

Yes, even in our life time, winter is not so bad. Look with me if you will, at the man or woman, silver-white hair that shames the snowdrifts but with a smile that matches the flowers of spring. Yes, they are in the winter of life, and could make it somber an' very disagreeable but they don't. God bless the man or woman with silver-white hair that still sees the sunshine of life—that sees the beauty of it all—those who have sympathy for, an' mingles with the young. To them there can be no real winter—there is no winter to any of us unless we look through gray an' wint'ry eyes. Oh yes, my friends, I love the springtime 'cause everything speaks of new life; but I also love the summer fall an' winter —not only of the seasons but of life itself, an' of all the seasons I think the winter jest the best—'specially if we try to make the winter season—whether of life of natur' the best season. Are you linvin in spring, summer, fall or winter? An' are you makin the most of your seasons? —Cordially yours, Uncle Rube.

THE TRUTH ABOUT HENRY FORD

(Continued from page 9.)

Mrs. Edison and Mrs. Ford are to be the only two women on this executive memorial board.

At the beginning of the European war Mrs. Ford leased Oughtrington Hall, in Chestshire Township, England, a short distance from Warwick, where her mother was born. She equipped it as a home for Belgian refugees; one hundred at a time were clothed, fed and sheltered there. As they found friends, relatives or work was secured from the London clearing house. Teachers were employed for the children; a school room was furnished; outdoor tennis courts were covered and heated for a supervised playground. Tailoring and other trades were taught the refugees. Among them was a Catholic priest, and a chapel was equipped in which he said mass and held other services. Wonderful results were accomplished, as is attested by letters and documents from the Lord Mayor and others. After the armistice the furniture and equipment were sold and the proceeds placed with the Manchester Belgian Relief Fund to be used by that organization. When Elizabeth, Queen of the Belgians, visited this country, Mrs. Ford was one of the few women on whom she bestowed her medal which is inscribed: "Pro patria Honore et Cartate."

Mrs. Ford's most intimate friends are those she knew in girlhood or before the advent of automobiles. Her poise and culture, her innate goodness, makes her immensely popular. Her judgement and clear intellect have been of untold value to her gifted husband. Their ideal home life is a happy demonstration that love does not dwell only in a cottage. The following incidents somewhat indicates her tastes.

Shortly before the holidays in 1920, while she was shopping in New York, the clerk of a Fifth Avenue shop asked her to inspect the Duke of Hamilton's silver service. It weighed seventeen hundred pounds, and was heavily crested. It had been sold to a young mid-western manufacturer to match his dining-room set, also purchased from the Duke's estate. "Would Mrs. Ford care to place an order for similar silver?"

She has a vivacious and cordial smile. "I have no ambition to collect heirlooms of royalty," she replied. "My resources are needed elsewhere."

The undaunted clerk produced a short string of pearls, each as large as a hazel nut. "Only a half million dollars," he urged suavely, as he laid them on the black velvet square to accent their creamy sheen and luster..

Mrs. Ford shook her head. "At home I have the finest jewels in the world," she remarked, as she concluded her purchases. "Nothing you have on sale can equal them."

The Fords have a son; his home is ten miles east of Detroit, in Grosse Pointe on Lake Sainte Claire, near the point where it joins the Detroit River. The Henry Ford estate is ten miles west of the city on the Rouge, which also flows into the Detroit River. A private telephone wire connects Mr. Ford's study with his son's; a private wire connects Mrs. Ford's bedroom with the sleeping porch of her grandchildren, Henry II and Edsel junior, chubby, golden-haired, blue-eyed cherubs. Like the Athenian mother, Mrs. Ford says: "These are my jewels."

THE FARMERS' TROUBLE—OVPRODUCTION

(Continued from Page 16.)

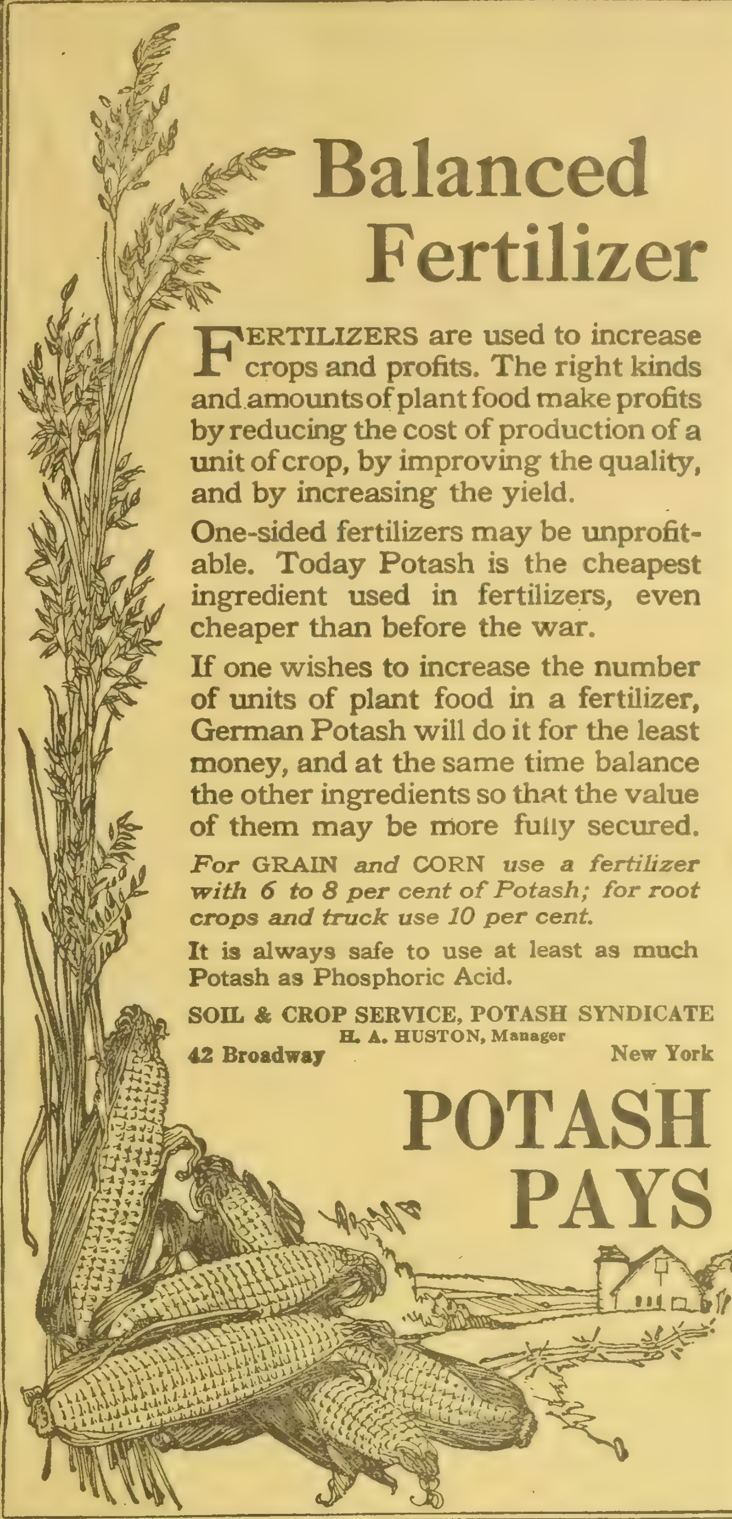
of farmers and increases the number and buying power of farmers' customers. Any substantial reduction of freight rates can be made (until we have government ownership) only by bankrupting the roads of beggaring their employes. Lending money or giving credit to nations whose credit is exhausted to enable them to buy our surplus is practically making them a present of it. If our lawmakers really want to get our farmers more money for their crops, several nations have lately shown them a sure way to do so. The Japanese government, by taking control of the silk crop, has nearly doubled the price of raw silk in two years. Brazil has done the same thing with coffee. England is now doing likewise with rubber and tea. As this country takes 75 per cent of silk, coffee, and rubber that these nations export, and they in turn take most of our surplus wheat, cotton, etc., it wouldn't seem unfair if our government, by taking control, made them pay enough for our wheat and cotton, at least, to give our farmers a slight margin of profit.—J. Tierney, Illinois

---

FARMERS' EXCHANGE SHOWS REMARKABLE RECORD

BEGINNING with a borrowed working capital of $5,000 in 1900 the Eastern Shore of Virginia Produce Exchange at Onley, Va., which is composed of farmers on the narrow strip of land separating Chesapeake Bay from the Atlantic Ocean, has built up a business that is a conspicuous example of successful farmer cooperations in the opinion of the United States Department of Agriculture. In 1922, total sales aggregated more than $9,000,000. A profit of $57,000 was made, of which $39,000 was distributed as patronage dividend and the remainder carried as surplus. At the close of business December 31 the exchange had an outstanding capital of $31,000 and a surplus of $265,000.

The principal products sold are white potatoes, sweet potatoes, strawberries, cabbage, and onions.



Balanced Fertilizer

FERTILIZERS are used to increase crops and profits. The right kinds and amounts of plant food make profits by reducing the cost of production of a unit of crop, by improving the quality, and by increasing the yield.

One-sided fertilizers may be unprofitable. Today Potash is the cheapest ingredient used in fertilizers, even cheaper than before the war.

If one wishes to increase the number of units of plant food in a fertilizer, German Potash will do it for the least money, and at the same time balance the other ingredients so that the value of them may be more fully secured.

For GRAIN *and* CORN *use a fertilizer with 6 to 8 per cent of Potash; for root crops and truck use 10 per cent.*

It is always safe to use at least as much Potash as Phosphoric Acid.

Make the First Cost the Only Cost

The value of a good silo reaches its greatest height in a Kalamazoo Glazed Tile Silo because the superior quality of Kalamazoo Tile means perfect ensilage. Stock raising and dairying are by far the most profitable types of farming, and silage is unquestionably the most economical feed for livestock and dairy cattle.

Kalamazoo Tile and Wood Silos

Our Glazed Tile silos are everlasting—decay-proof, storm-proof, vermin-proof; will not burn or blow down; save repair and paint bills. Three dead air spaces make perfect insulation against cold, heat, dampness. Kalamazoo Tile is made from selected quality clay in our own plant located in the center of the finest tile clay district. Our Wood Stave Silos have stood the test of 30 years. We are America's pioneer silo builders. All Kalamazoo Silos are fitted with continuous door frames of galvanized angle steel. Send for our free book of silo information.

The Kalamazoo Plan

Get the facts about Kalamazoo Tile and our building service—drawings and blue prints to fit requirements. Write for beautifully colored illustration of the Modern Kalamazoo Plan. Address Building Plan Department,

FROM THE BALLAD OF READING GAOL

By Oscar Wilde.

IN Debtor's Yard the stones are hard,
And the dripping wall is high,
So it was there he took the air
Beneath the leaden sky,
And by each side a Warder walked,
For fear the man might die.

* * *

Or else he sat with those who watched
His anguish night and day;
Who watched him when he rose to weep,
And when he crouched to pray;
Who watched him, lest himself should rob
Their scaffold of it's prey:

* * *

For oak and elm have pleasant leaves
That in the spring-time shoot;
But grim to see is gallows-tree,
With it's adder-bitten root,
And, green, or dry a man must die
Before it bears it's fruit.

* * *

It is sweet to dance to violins
When Love and Life are fair;
To dance to flutes, to dance to lutes
Is delicate and rare;
But it is not sweet with nimble feet
To dance upon the air.

* * *

I know not whether Laws be right,
Or whether Laws be wrong;
All that we know who lie in gaol
Is that each day is like a year,
A year whose days are long.

* * *

The vilest deeds like poison weeds
Bloom well in prison air;
It is only what is good in man
That wastes and withers there;
Pale Anguish keeps the heavy gate,
And the Warder is Dispair.

WOMEN HAVE MUCH TO LEARN

THE editor of this page recently had an interview with former Senator Eva M. Hamilton of Grand Rapids. She says that women have much to learn in politics, that, "In the first place they do not back each other as they should, that they allow personal feelings to come in and befog the issue, that women are much inclined to be jealous of each other in politics and it being a new game in the hand of amatuers an unseemly scramble for honors is the result."

This desire to be the standard bearer among the women active in politics and the quite general indifference of the majority of women does leave much to be desired and yet a review of the bills that have been passed thru womens efforts and the constructive legislation that is under consideration gives the student of these matters much hope.

From its organization, the National League of Women Voters has believed in and worked for the removal of all unfair discriminations against women, under the law. In less than three years, sixty-three laws in twenty-six states have been secured to this end, largely through League effort. The greatest single federal disability left after women were given the franchise, has been removed and the citizenship of married women made as independent of marriage as is the citizenship of men.

The League believes in, and works for, also, protective legislation which the experience of the world has shown to be needed for the good, not of women only, but of the race. Because we believe that women need a kind of protection which men do not need, we have worked for minimum wage laws, mothers' pensions, the 8-hour day for women in industry, the Sheppar-Towner law, and other measures necessary to safe-guard the future physical well-being of the race through proper consideration for potential mothers.

If you are interested in the work that the National League of Women Voters is doing write to the headquarters, 25 Traction Building, Peru, Indiana, for pamphlets telling of it's work. Write for Specific Bills for Specific Ills and enclose 10c. It is interesting reading.

GLAD OR SORRY?

THE Ballad of Reading Goal came to my mind this morning when I picked up the paper and read that once more Michigan had voted against capitol punishment.

The prison walls have given us two very wonderful expressions of the English language. Pilgrim's Progress written by John Bunyan a saintly man and the above mentioned ballad written by a man in which the low and the high struggled for mastery, Oscar Wilde, of unquestionable literary ability but who was convicted of a moral crime and served two years in a penitentiary.

When one remembers that in 1921 there were committed in the city of Detroit alone 100 murders one's sence of justice cries out for the supreme penalty but when one reads clear thru, The Ballad of Reading Gaol a horror of legalized murder grips the soul, and one is inclined to be glad that the record of our State has been against it since 1847.

The Farm Home

A Department for the Women

Edited by MRS. GRACE NELLIS JENNY

TEACH INDEPENDENCE

I WONDER if I dare to call myself a thotful mother, so as to take part in the discussion of your question. Anyway, I have three children, and it seems to me that I think several times a day. Will that do?

It is my firm conviction that children ought always to be told the reason for rules, or helped to find the reason.

I figure it out like this: If I have not a good sound reason for any rule or request, then that rule or request is unreasonable. If I try to enforce it I am an unreasonable mother.

On the other hand, if I have a good sound reason for any rule or request, I can develop the child's reasoning power by helping him to find the reason. And well developed reasoning power results in a reasonable child.

All too soon our children must leave us to begin manifesting what we have taught them. If they are not taught to reason while in our care, they must learn by bitter experience later on. If children were horses and parents could always hold the lines we might say "Whoa, back, gee, haw, giddap." They would have to obey "Because I say so." But children are not horses, and parents cannot always hold the lines.

I am acquainted with three families who grew up under that sort of discipline. After a while the guiding hand dropped the lines. * * *

The ones who were gifted with horse sense knew they could only pull, while someone else drove. They are self-supporting.

The ones who lacked horse sense believed that after a lifetime of pulling, they could now drive, and tell someone else just how to pull. They will end their days in the poor house.—Mrs. J. C.

OUR LEAD

THE Detroit Saturday Night followed our lead this week and came out with an article on how and how not to take cold. I print the following remedy which we overlooked:

"I can gib you sobething for your cold," says a kind friend between sneezes. "Take a raw odion and cud it into slices. Thed put some viddegar on it and ead id before you go to bed. Id always cured be."

CORRESPONDENCE COLUMN

There are two pattern orders on my desk which I cannot fill for the reason that no post-office address is given. One asks for No. 2696, 30 waist measure, the other for the same No., size 26. I will gladly fill the orders as soon as I receive the necessary information. A number came thru this week with no change or stamps enclosed and no sizes mentioned. Please look your orders over well before mailing, it will save you disappointment and delay.

I have just bought a second-hand Majestic range. It is in good shape with the exception of a little rust. Now can any of our readers tell me the best way of cleaning that rust. Is there any kind of enamel paint that will not burn off? Thanking you for an early reply.—Mrs. M. E. R.

—To clean steel oven doors, rub briskly when the door is warm with a cloth dipped in vinegar.

To clean the iron parts saturate a woolen cloth with linseed oil and rub until the rust disappears, next rub with a dry clean cloth. Now use a Rust-proof paint and the range should be in very good condition. I am mailing you a card giving the name of a firm that makes a rust-proof paint. If any of our readers have suggestions to make along this line I will publish them.

J. D. O.—Tarnished copper may be cleaned with vinegar and salt. Care must be take to remove all traces of it or the preparation will corrode the copper. Wash off carefully and rub dry with a clean soft cloth.

Claude R.—Write to some music store in a large city, they will furnish you with what you want if it is obtainable.

I saw in the M. B. F. a request for the Sec. of the Treasury under Lincoln. I have a picture of Lincoln and his cabinet, as follows: President, Abraham Lincoln; Sec. of War, Frederick Stanton; Sec. of Int. Caleb B. Smith; Sec. of Navy, Gideon Welles; Sec. of State, William H. Seward; Sec. of Treas., Salmon B. Chase; Postmaster General, Montgomery Blair; Attorney General, Edward Bates.

Have all the songs asked for been received? I had some of them but was too busy in the fall to send them in.

This is my first letter to the paper. We have always taken it and would be lost without it if it did not come, we helped to get it started.—Fraternally yours, R. A. Kinney.

—The Dead Man's Hand was one poem asked for and not received. The Brier Rose another.

We would like very much to get the full name of a Mrs. McAllister whose husband and brother kept a staple and fancy grocery store at Otsego over ten years ago. I will very much appreciate any information.—Mrs. Perry Haven, 530 Pine St., Mt. Pleasant, Mich.

Some time ago I saw a recipe for curing rancid lard, in your department. I intended to cut it out. but was taken sick and did not. The paper is now gone and I ask you to print it again. Will appreciate it very much.—A Reader.

—Re-heat the lard being careful not to fill the kettle more than three fourths full. When hot put in a large handful of salt, stir well for a few minutes, remove from the fire and strain. The salt will settle to the bottom of the kettle, the lard will not taste at all salt and will be much improved.—From issue of March 4, 1922.

I am asking you to thank the good woman who gave the cure for eczema. I saw it in your helpful corner eight months ago and have been helped greatly by it. I wish to thank her and you also. Your corner is my choice of this paper. May the good work go on.—Mrs. Bert Tidey.

J. M. B.—Shingles is not a contagious disease. It is sometimes produced by sudden exposure to cold after violent exercise and sometimes follows acute affections of the respiratory organs.

The treatment consists in gentle laxatives, and in rectifying any derangement of the system. It sometimes has an obscurely nervous character, occurs in the course of a nerve and is proceeded by stinging neuralgic pains. It must be allowed

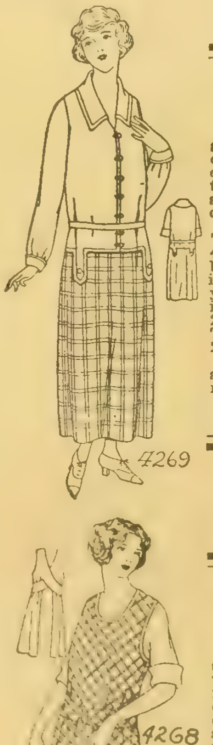
FASHION BOOK NOTICE

Send 12 cents in silver or stamps for our UP-TO-DATE SPRING and SUMMER 1923 BOOK OF FASHIONS, showing color plates, and containing 500 designs of Ladies', Misses' and Children's Patterns, a CONCISE and COMPREHENSIVE ARTICLE ON DRESSMAKING.

ALSO SOME POINTS FOR THE NEEDLE (Illustrating 30 of the various, simple stitches) all valuable hints to the home dressmaker.



4269

A Popular Style

4269. Chambray and gingham, or serge and checked or plaid suiting could be combined for this model. It portrays a style becoming to slender and mature figures. The Pattern is cut in 7 Sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 2 ½ yards of 36 inch material for the waist, and 2 ⅜ yards for the skirt. The width at the foot is 2 ⅜ yards.

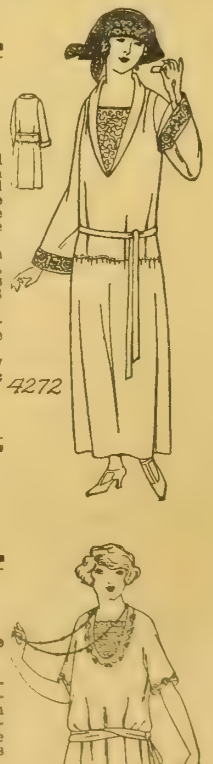
Pattern mailed to any address on receipt of 12c in silver or stamps.

One of Fashion's Favorites

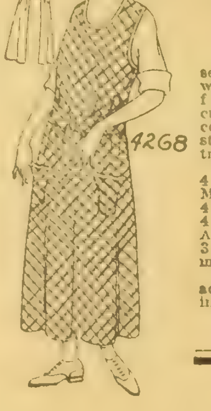
4272. Blue broad cloth, braided with soutache would be good for this model. The style is also attractive for velvet, Canton crepe and taffeta.

The Pattern is cut in 7 Sizes: 36, 38, 40, 42, 44, 46 and 48 inches bust measure. A 38 inch size will require 3 ⅞ yards of 54 inch material. The width at the foot is 3 yards.

Pattern mailed to any address on receipt of 12c in silver or stamps.



4272



4268

A Practical Apron Model

4268. Gingham was selected for this design, with white bias banding for a finish. Sateen, cretonne, chintz or crepe could be used with stitching or braid for trimming.

The Pattern is cut in 4 Sizes: Small, 34-36; Medium, 38-40; Large 42-44; Extra Large, 46-48 inches bust measure. A medium size requires 3 ¾ yards of 36 inch material.

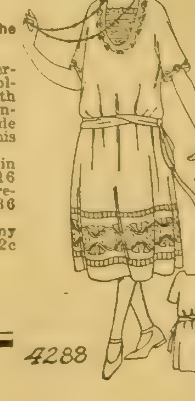
Pattern mailed to any address on receipt of 12c in silver or stamps.

A Simple Frock for the Growing Girl

4288. Blue wool jersey embroidered in colors, or green taffeta with piping and vest of pongee in a natural shade will be pretty for this model.

This pattern is cut in 8 Sizes: 12, 14 and 16 years. A 14 size requires 3 ⅝ yards of 36 inch material.

Pattern mailed to any address on receipt of 12c in silver or stamps.



4288

to run it's course. Languor, loss of appetite, shiverings nausea and headache often follow after which the erruption appears in irregular patches. The erruption recedes by the fifth or sixth day. Gentle laxatixes, rest and quiet for a few days accompanied by a light diet is about all one can do to overcome the disease.

My husband is . cripple and we have three children two boys, one four and one five and also one little girl of two. We are very much in need of clothes for the children and in need of quilts, if some readers had pieces of percale and gingham I could make them into quilts. We are trying to raise our children the best we know how but I do need help and come to the readers of Our Page asking for it.—Mrs. Mansel Cone, Rosecommon, Mich.
—I believe this lady is entirely worthy and that she needs and deserves help so do what you can. I am mailing her a bundle to-day and hope it will be of use to her and her little family.—Mrs. Jenney.

One of our subscribers will make sweaters, bonnets, crocheted hats, booties, door-panels and table runners.

If you wish her address write to me for it.—Mrs. Jenney.

Who can send the words to the song, "The Maine?" I think it was called "Remember the Maine."

SOMETHING FRESH

From a youthful writer of very tender years, comes an article published in the London Morning Post, called, "The Advantages and Disadvantages of Novel-Reading." Read it and smile once more.

SOME person's opinion differ greatly with regard to the reading of novels there are a good many different kinds of novels, such as 1d., 2d., 4d., 6d. I do not think there is much harm in reading novels if you read them at the right time, and do not spend to much money on them, which is sometimes the case. The Waverly novels, for instance, are not at all bad books if read at the proper time. The great fault of some people are that they are always reading novels, and of course the more they read the more they want. I think it is not right to read a novel on Sundays; it is just as much harm as playing, because it generally gives great pleasure to the mind. The great harm of reading novels are to be careful not to follow them. Novels do not increase your learning much, but does sometimes decrease it. I think it is about the worst thing any schoolboy could have in the way of books and 4d. novel it generally does a lot of harm. Tom Jones was a very good novel and was written by a very good novelist. George was also a great novelist who died but a short time ago.

BOUGHT A COMMUNITY CANNER

FIVE farm women in Bates county have provided full shelves of canned fruit and vegetables for their families at a minimum outlay of time and labor according to extension specialists at the Missouri College of Agriculture.

At the beginning of the canning season last summer these women, following the suggestion of their home economics agent, bought a steam pressure canner, a supply of tin cans and a can sealer. Through the co-operative ownership and operation of this equipment all kinds of food have been preserved in the safest and easiest way and the cost to any one family has been camparatively small.

POINTS OF INTEREST

We still have the unsightly billboard with us, however.

Buyers of poultry, say the Nooksack, (Wash.) Sentinel, have discovered that healthy birds can not be found on farms where the poultry and cattle are allowed to run together except when the herd has been tested and found free from tubercular taint.

Up in the vicinity of Traverse City, Michigan large numbers of robins are reported, which the native declare, forgot to go south last fall. But the question is, how do the natives tell whether a robin's coming or going?

Apples having neither seed nor core are being developed in Abbotsford, Canada. The fruit is a veriety of Farmeuse and has only a slight marking of the flesh where the core is ordinarily found.

The windowless room is a menace to health and is unfit for occupation by either man or beast.

HEALTH HINTS

OR
HOW TO CURE YOURSELF
BY
DR. T. N. ROGERS

CANCER

CANCER is not a local disease or a blood disease but a constitutional one. Coming on very slowly and insiduously. Diet has very much to do with it, and diet has more to do with it's cure than anything else. Cancer and rheumatism are very often associates. Most cancer gives history or rheumatism. The one big factor is diet. The blood in rheumatism and cancer show almost the same conditions.

Preventative Measures

Eat very little meat. However, I consider starchy foods more harmful than meat as they produce an acid condition or an acidosis. The ordinary breakfast foods are indigestible and so ferment in the stomach especially when boiled. Baking or roasting is much better for any starchy food. White bread as baker's bread should not be eaten with meat. The meat takes three hours to get out of the stomach and by this time the starch in the bread is fermented and throws out or forms acids which are poison. We call this Toxemic poisoning. This irritates the stomach causing catarrh, then ulcers, or cancer. The poison may be carried to other parts of the body and produces a condition of the tissues which lowers the vitality and favors the formation of cancer.

Increase of Cancer

Cancer has increased 30% in 20 years. Cold storage foods, meat and vegetables create too much acid in the body and so breed germs which cause cancer. The public taste for such food is increasing every where, also the habit of eating meat in large quantities.

CONSTIPATION

CERTAIN foods improperly cooked cause constipation and the colon becomes clogged and a seed bed of disease. The safeguard is a reformed diet of nutritious and natural foods, fruit, cereals and vegetables well cooked.

Test the saliva with blue litmus paper yourself and if the paper turns red you are on the road to trouble. Better stop and make a fresh start, cut down the starch, sugar and meat and cut out coffee, drink plenty of water, eat only two meals a day for a while and fast one day each week.

CURE FOR EAR-ACHE

Having received so much help from your paper I want to do my share. I enjoy every page of the M. B. F. and am anxious for it to come. I will send my remedy for ear-ache.

My little girl of nine was bothered with gatherings in her ears and suffered very much. After using this remedy she was entirely cured. Take a cotton cloth, double it and wet it put it in on onion cut fine and one-half as much tobacco. I used Peerless. Tie cloth in a sack shape and lay in hot ashes until the onions are cooked, squeeze out juice and put in ear. It acts at once. I press out all the juice I can and keep it for another time. Just warm it a little.
—A Reader.

LAUGH IT OFF

Are you worsted in a fight?
Are you cheated of your right?
  Laugh it off.
Don't make tragidies of trifles;
Don't shoot butterflies with rifles;
  Laugh it off.
Does your work get into kinks?
Are you near all sorts of brinks?
  Laugh it off.
If it's sanity you're after,
  Laugh it off.
—Modern Methods

There's no recipe like laughter—

There is no "Just As Good"
Don't accept substitutes—don't buy baking powder that is supposed to be just as good as Calumet—don't think that a big can at a low price means a real saving. Use
CALUMET
The Economy BAKING POWDER

CALUMET
BAKING POWDER
CONTENTS 1 LB.

BEST BY TEST
Avoid disappointments. Millions of housewives are using Calumet because of its dependability. They know that the bakings will always turn out just right. Pies, cakes, biscuits, muffins, will always be perfectly raised, light and wholesome if you use Calumet, the real economical leavener.
Calumet sales are 2½ times as much as that of any other brand—always call for it.
THE WORLD'S GREATEST BAKING POWDER

82¢ Buys All the Wall Paper for An Entire Room

Saved Big Veterinary Bills — Cows Gave More Milk the Year Through

Mr. C. E. Dodge of Dewittville, N. Y., is one of the many cow owners who have discovered that it pays best to PREVENT cow diseases. He knows that it is a fine thing to have on hand such a valuable medicine as Kow-Kare in the event of actual diseases, such as Abortion, Retained Afterbirth, Barrenness, Milk Fever, Scours, Bunches, etc. But he also knows that a moderate use of Kow-Kare in the feed not only PREVENTS these diseases, but greatly increases the winter milk flow. He writes us his experience, as follows:

"Since I have been on the County Farm, I have been using Kow-Kare in the dairy for the last ten years. I have 52 cows. My experience is that a few dollars' worth of Kow-Kare saves us a great many dollars' worth of veterinary bills, and also every cow in the dairy that I feed it to produces more all the year thru because of the Kow-Kare. I have no sick cows or trouble, when I begin feeding Kow-Kare, from the first of January until I turn them out in the Spring."

Winter feeds are so much harder on the digestive and milk making organs of the cow that the vitality of these functions is sure to become impaired unless nature is assisted. Kow-Kare is designed primarily to strengthen these very organs so that they may throw off disease and keep up the normal milk production.

The best of it is, this valuable Kow-Kare treatment costs so little. Just a tablespoonful of the remedy morning and evening about one week in each month will keep a cow in best of health and heaviest milking. Your troubles from sick and backward cows are over when you have learned to depend on Kow-Kare.

Feed stores, general stores and druggists sell Kow-Kare; large size, $1.25, medium, 65c. If dealer is not supplied we will mail, postpaid, on receipt of price. Write now for valuable book, "The Home Cow Doctor."

DAIRY and LIVESTOCK

10 MICHIGAN HOLSTEIN BREEDERS JOIN NATIONAL ASS'N.

TEN Michigan Dairymen were recently admitted to membership in The Holstein-Friesian Association of America, according to an announcement just issued by Secretary F. L. Houghton. They are Lyman E. Beach of Groswell; F. B. Breeks of Corunna; C. E. Chappell of Charlotte; Robert J. Crouse of Howell; A. B. George of Garland; Francis D. Guncer of Riga; Edward B. Henne of Manchester; Mark A. Knight of Rockwood; O. B. Merriman of Deckerville and Marion R. Wilkinson of Dowagiac.

The Michigan membership in this association now numbers 1,443. According to the 1920 government census, there were 46,533 purebred dairy cattle in this state, of which 32,702 were Holsteins. With a total membership of over 22,000 living animals registered in its Herd Books, this livestock breeders' association is the largest in the world.

NEW MICHIGAN HOLSTEIN IN JUNIOR CLASS

Burke Pontiac Clare is new State Holstein champion in the yearly test period division junior three year class, according to official announcement by The Holstein-Friesian association of America. She is owned by W. C. Cornwell of Saginaw. In one year she produced 23,2118 pounds of milk and 747 pounds of fat.

MIXTURE OF BEANS AND OATS UNPALATABLE

Would like to feed cull beans and oats to milk cows. Would like to know how many pounds of oats to a hundred pounds of beans, to make a good ration for milk cows, to be ground together.—C. Q., Marion, Mich.

—We are feeding the following ration to some of the cows in the college herd at the present time: 500 pounds of oats and beans ground together, 300 pounds of hominy, 100 pounds of ground corn and 100 pounds of gluten feed.

This ration as you will notice, contains 25 per cent ground beans. Beans and oats are ground together in equal amounts. This ration seems to be a fairly satisfactory one for diary cows. If only beans and oats are going to be fed, I would recommend that equal parts of beans and oats be ground together for feeding. The percentage of beans in a ration of this kind, would, of course, be affected by the kind of roughage fed to the cows. I do not like your grain ration, consisting of just beans and oats, as there is danger of feeding too many beans to the cow. I think you will find that a mixture of just beans and oats in this proportion rather unpalatable as the cows have a dislike for the ground beans.—J. E. Burnett, Asso. Prof. of Dairy Husbandry, M. A. C.

MAKING ALFALFA MEAL

Can you please tell me how alfalfa meal is made?—A. Z., Grand Rapids, Mich.

—The grinding of alfalfa into meal was practiced quite extensively in Kansas for several years but has been more or less discontinued and has moved further west into the irrigated sections of Colorado and Wyoming. It is quite an expensive practice costing from $3.00 to $6.00 a ton to make the meal, and after the meal is secured the feeding value is not materially increased. Stock will consume practically all the alfalfa hay without grinding; consequently, there is little advantage in grinding alfalfa.—C. R. Megee, Associate in Farm Crops, M. A. C.

CALF WEANED TOO YOUNG

Could you tell me what to do for a calf six months old. The calf was on the cow until it was three months old and did remarkably well. It came in July and in October last we weaned it. It has not done well since. Can't see anything particularly wrong only it has a small appetite. We have tried it on all kinds of feed but it seems the same. Doesn't drink over a half pail of milk or water.—J. H., Akron, Mich.

—I judge that you weaned the calf too young and did not have it accustomed to eating grain before it was weaned. Had this calf been thoroughly accustomed to grain before weaning, this trouble would not have been experienced. I would advise giving it plenty of good clover hay and as grain, would offer it a mixture of equal parts whole corn, oats and bran and endeavor to have it eat about one pound of grain daily for each hundred pounds that it weighs.—Prof. Geo. A. Brown, Department of Animal Husbandry, M. A. C.

VALUE OF CULL BEANS AS FOOD FOR CATTLE

Can you tell me how much food value cull beans ground fine contain for dairy cattle? How many pounds of grain to every pound of milk? Which is the best for ensilage, corn fodder or sun flowers?—M. D., Marion, Michigan.

The analysis of cull beans, as is shown by Henry's Feeds and Feeding, is as follows:

Total dry matter in 100 lbs. 87.2; Digestible nutrients in 100 pounds, Crude protein 18.3; Carbo Hydrates 54.3; Fat 0.8.

This analysis shows that two pounds of cull beans have about the same protein composition as one pound of cottonseed meal.

Your second question is not quite clear. You ask how many pounds of grain to every pound of milk. I am assuming that you mean how much grain to feed for each pound of milk produced per day. This varies somewhat with the test of milk. With a low testing cow a pound of grain to each three and a half or four pounds of milk produced per day is sufficient. For Jerseys or Guernseys, that have high testing milk, we feed a pound of grain to each three or three and a half pounds of milk produced per day.

The best ensilage crop we know of is corn. Corn fodder, as mentioned in your inquiry, does not make a very satisfactory silage. It is only in times when corn is very high in price that it pays to shuck the corn off the stalk and put the stalks into the silo. I would never advise the use of sunflowers for silage in a section or locality where it is possible to obtain a good yield of corn, but in the northern part of the state, where corn is a gamble one year with another, sunflowers will make an excellent substitute for corn in silage. O. E. Reed, Professor of Dairy Husbandry, M. A. C.

PUTTING PIGS ON SELF-FEEDER

I have forty fall pigs that weigh about eighty pounds each. I want to put them on a self-feeder. They get twenty gallons of skim milk a day. What would be the best feed to put in the self-feeder to make the best gain? Where one has that much skim milk, is tankage necessary?—P. M., Farwell, Michigan.

—Twenty gallons of skim milk will not be sufficient to provide enough protein or growth producing food for forty pigs weighing eighty pounds each. I would, therefore, advise putting tankage as well as corn in the self-feeder for them, using a separate compartment for each. If barley could be obtained any cheaper that corn, I would advise the use of barley.—Prof. Geo. A. Brown, Dept., of Animal Husbandry, M. A. C.

VETERINARY DEPARTMENT

OPERATION PROBABLY NECESSARY

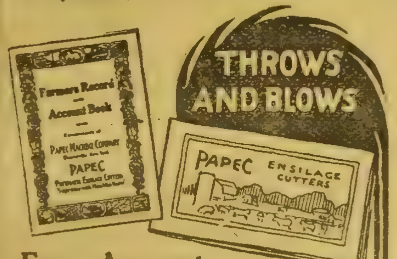
I am writing to your veterinary column for a little advise. I have a mare seven years old and is in the best of health. In October, 1922, a swelling came on the left side of her bag, it kept swelling until it broke and about one quart of slate colored matter came out of it. I took her to a veterinary and he cut it, cleaned it all out and gave me some dissinfectant to syringe it out with and said she would be all right, that it was an abcess, but it did not get all right. It swelled and filled up again and she got so ugly I could not do anything with her. In one month from the first time I had to call the doctor he opened it up and cleared it again

This Self-Feed

Saves You Money

The 1923 improvements on the Papec's "powerful compression" Self-Feed make it a better-than-ever Ensilage Cutter. This Self-feed saves you money—does the work of the men at the feeding table and does it better.

You can buy this new and improved Cutter, backed by the Papec Guarantee, at a **new low price.** The simple design, tremendous production and specialized machinery make this possible.



Farm Account Book FREE

Our Farmers' Record and Account Book will help you find and stop the money leaks. It contains 50 pages arranged for farm and household inventories, crops and breeding records, cash account, etc. Write us, telling the size of silo you own, or intend to buy, and mention your dealer's name and address. We will mail you this Account Book **free,** also the 1923 Papec Catalog.

FOR SALE—REGISTERED AYRSHIRE bulls and bull calves, heifers and heifer calves. Also some choice cows. FINDLAY BROS., R 5, Vassar, Mich.

and said as long as it stayed open and drained she would get along. I was not satisfied so I saw another veterinarian and he told me about the same. If I would bring her to him he would keep her and chloriform her and take care of her every day. But it was too much expense, I could not stand it and to have him come to my place would cost me twenty dollars a trip, so I thought you could give me advise.—G. H., Nessen, Mich.

—This is a case that in all probability will require an operation before a cure can be brought about. There may be a foreign body at the bottom of the fistula tract or it may be a diseased lymph gland that will have to be removed.—John P. Hutton, Assoc. Prof. of Surg. & Med., M. A. C.

REMOVING WARTS

I have a yearling steer which has large white warts about the size of a quarter in clusters on the sides of his neck and about his back. Have been on him for some time. He seems healthy and is in good shape. Would consider it a great favor in giving some remedy for it. —F. H. B., Cheboygan.

—We do not know the cause of these warts. Where there is only a very few warts present on the surface of the skin about the best treatment is to remove them by cutting them off after the surface of the skin has been well disinfected. The application of a little glacial acetic acid to the surface of the wart will sometimes cause it to disappear. Where you have a large number of them on the body and they are in clusters little can be done. Better send the steer to the butcher as soon as he can be gotten in good condition to kill.—John P. Hutton, Assoc. Prof. of Surg. and Med., M. A. C.

COW POX

I have a cow which has some kind of a breaking out on the bag which are small pimples which scab over. She is due to freshen in about eight weeks. Would like to know the cause and a remedy.—V. B., Dryden, Mich.

—From the history given of the case I am of the opinion that the trouble is cow pox. Try washing the udder after each milking with a 1 per cent solution of sodium hyposulphite. No internal treatment is required.—John P. Hutton, Assoc. Prof. of Surg. & Med., M. A. C.

FEED SOW SCORCHED CORN

What should I do with my Poland-China sow, as I have her in a large pen and she doesn't come in heat nor hasn't been in heat for the last six months. Have raised two litters with her already. She is two years old, and I feed her tankage and corn. Have given her oats at times and also charcoal—Reader.

—A method that often proves effective in getting sows to come in season is to feed them entirely on scorched corn for a few days.

If this fails, drugs may be resorted to. We have used a preparation known as Vetol, put out by Lehn & Fink, 124 Williams Street, New York City, with very satisfactory results.

If this sow is fat, it would be a good idea to limit her feed allowance to reduce the condition of flesh.—Geo. A. Brown, Prof. of Animal Husbandry, M. A. C.

NO LAW ON DISTANCE HOGS MUST BE FROM ROAD

I would like to know how far from the public highway do I have to keep my hogs that are being fattened in a building? And how far from the highway must the other ones, brood sows and such, be if confined? They are in a small pard of less than one half acre.—J. B. B., St. Charles, Mich

—There is no State law fixing the distance that hogs must be removed from a public highway. It is simply a question of whether of not they are allowed to become a nuisance. The matter is under the control and within the jurisdiction of township officials.—M. J. Smith, State Department of Agriculture.

PORK EXPORTS DECREASE IN 1922

Exports of pork and pork products from the United States were less in 1922 than in 1921, according to reports of the United States Department of Agriculture. This decrease was due to smaller shipments of bacon and lard.

Michigan Farm Bureau Brands include the Best varieties of alfalfa, clover, seed grains and other field and grass seeds. Their Vitality, Description and Purity is guaranteed to be as represented to the full amount of the Purchase Price.

Certified Seed Oats and Barley

These varieties are certified after field and bin inspection on the basis of freedom from mixtures, foul seeds and diseases.

Through years of constant selection and elimination of weaker strains, they are the highest yielding in the state.

Even those who purchased seed of these varieties two or more years ago can afford to purchase new seed stock at the reasonable prices quoted this year.

If you are growing "Just Oats" or "Barley" you cannot afford to miss this opportunity to make money on the increased yields these varieties will return.

Wolverine, Worthy Oats

Contagious Abortion

Can be Stopped in Cows and Sows

Erick Bowman
Discoverer of the
Bowman Abortion Remedy

That statement applies to *Your* herd. It's no use to worry about past losses which this dread disease may have caused. The important thing to do is to save yourself from future losses by stamping out every trace of Contagious Abortion *Now.*

The Bowman Abortion Remedy has behind it a record of positive results in the thousands of cases where it has been used. These should recommend it to anyone facing the problem of how to eradicate Contagious Abortion. The experience of satisfied users is your best guide. The Bowman Abortion Remedy will positively rid your herd of Contagious Abortion. Any farmer can administer it with ease. Cattle and hogs like it and take it readily when it is given to them.

"It did all you claim for it." writes Mr. Weiner

Columbus, Wisconsin
December 3rd, 1922

Erick Bowman Remedy Co.,
Owatonna, Minn.

Gentlemen
In reply to using your abortion remedy I can say that it did all you claim for it. We had lost six calves but after using your remedy, we have not lost any more.
We have seventeen live calves now. Cows cleaned nice with cleanings nice and fresh.

Yours respectfully,

HENRY WEINER

MICHIGAN CROPS

CULTIVATION—FROM 53 YEARS' EXPERIENCE

CULTIVATION of land begins with plowing and the first question will be when and how deep. When to plow will vary according to the crop and land conditions. Plowing long enough before the crop is planted to get the weeds killed on the surface is a big gain whenever practical.

As oats, barley and spring wheat need sowing very early in the spring, the only way to plow long before planting in this state is to fall plow and while this is fine under some conditions it is bad under others. Soils that are heavy and wet or hillsides that are bad should not be fall plowed so they will have to be sowed as soon as the ground can be fitter for them and in case of heavy wet soils don't plow them too wet as you will injure the soil if you do.

As to depth, oats will do well on shallow plowing if a sod has been turned down the year before sowing the oats. When plowing sod for corn I get best results by going by the depth that the grass roots go as soil that is much below where the grass roots grow is generally poor or in a poor condition to feed the corn roots.

Plowing as early as the ground is fit to work and harrowing smooth to get the surface weeds to sprout so they can be killed give the best results with corn as this warms the soil and kills the weeds at one time.

Potato ground needs to be plowed a little deeper than for corn and can be worked longer before planting and harrowed deeper if it needs to be, but it can be made too loose. In a dry time the ground should be just loose enough for the roots to penetrate easily and yet to press some against the roots and then air must get into the ground enough for chemical action on the soil, but not enough to dry it up too much.

Watch and see what condition the soil is in when the crops grow the best and then aim at keeping it in that condition. Cultivate shallow if the ground is loose and dry and deeper if the soil is heavy and wet or caked. Cultivate with fine teeth and nearly level in a dry time; use larger teeth hilling up when the soil or weather is wet.

Potatoes should be hilled enough to prevent them from sunburning or freezing too easy and this means more hilling if they set shallow than when they set deep. Cultivate beans level and smooth.—Francis G. Smith,

VALUE OF TIMOTHY OR CLOVER FOR FERTILIZER

I would be pleased to received your estimation as to what hay (each all clover & all timothy) in the barn ought to be worth to be of the same value to me, to leave in the barn and leave the new crop on the ground as fertilizer.—F. H., Scotts, Mich.

—It is rather difficult to arrive at a satisfactory estimate of the value of timothy and clover hay for fertilizer purposes. The feeding value is usually much greater than the fertilizing values especially when we consider the fact that when the hay is fed and the manure well taken care of from fifty to sixty-five percent of the nitrogen, sixty to eighty percent of the phosphorus and sixty to eighty percent of the potash of the original feed may be returned to the land in the manure. Of the organic matter from twenty to thirty-five percent is returned. Consequently, the greater profit is usually secured by feeding the hay and carefully returning the manure to the land.

Also, the value of hay as a fertilizer depends greatly upon the need of that particular soil for organic matter and whether or not the succeeding crop can make use of fertility in this condition.

The following table from Henry's "Feeds & Feeding" shows the fertilizing constituents in 1,000 pounds of hay and the fertilizing and fanurial value estimating nitrogen at 18c per pound, phosphoric acid at 4½c and potash at 5c per pound and assuming that on the average a farm animal will return 80 per cent of the fertilizing value of the feed in the manure. The manure will have to be very carefully handled to prevent additional losses:

Fertilizing Constituents in 1,000 lbs. Timothy Hay, Nitrogen 9.9, Phosphoric acid 3.1, Potash 13.5, Fertility Value per ton $5.20, Manurial Value per ton $4.16.

Fertilizing Constituents in 1,000 pounds Red Clover Hay, Nitrogen 20.5, Phosphoric acid 3.9, Potash 16.3, Fertility Value per ton $9.36 Manurial Value per ton $7.49.

Timothy hay then is worth approximately $5.20 per ton and red clover hay $9.36 per ton for fertilizing purposes according to the above estimate.—Prof. C. R. Megee, Farm Crops Dept., M. A. C.

CROPS DRAW ALL ELEMENTS OF FERTILITY IN SOIL

"Will you please inform me what substance corn takes from the ground and what it gives back to the soil? Also wheat, oats and potatoes. —T. L., Onaway, Mich.

—The crops, corn, wheat, oats and potatoes draw all elements of fertility in the soil. The following gives the amount of nitrogen phosphorus and potassium in pounds in the above crops:

Corn 100 bu. including stover, Nitrogen 148 pounds, Phosphorus 23 pounds, Potassium 71 pounds.

Wheat 50 bu. including straw, Nitrogen 96 pounds, Phosphorus 16 pounds, Potassium 58 pounds.

Oats, 100 bu. including straw, Nitrogen 97 pounds, Phosphorus 16 pounds, Potassium 68 pounds.

Potatoes, 300 bu., Nitrogen 63 pounds, Phosphorus 13 pounds, Potassium 90 pounds.

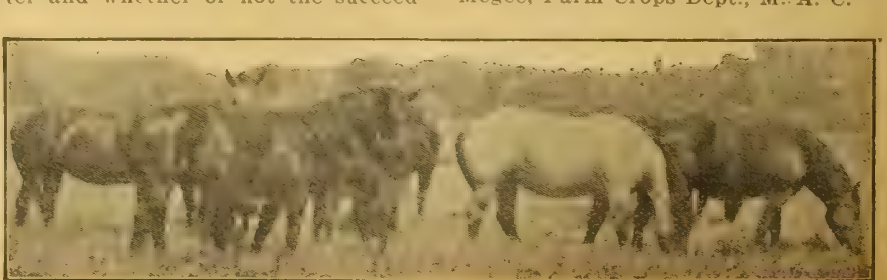
Inasmuch as these crops are nonlegumes they return to the soil, when the entire crop is returned, only the amount of nitrogen, phosphorus and potassium removed by the crop. In addition to the elements of fertility organic matter is returned which is a great benefit to most of Michigan soils.—G. M. Grantham, Soils Dep't., M. A. C.

CHEROKEE CLOVER

I would like some informaion regarding Cherokee clover. Is it adapted to Michigan conditions? What kind of land does it require and what is its feeding value?—D. G., Alanson, Mich.

—Cherokee clover is an early maturing variety of beggarweed. This is an annual legume with large beanlike leaves and with stems and roots somewhat like sweet clover. There are approximately twenty-six varieties of beggarweed, only two of which are of value commercially; namely the Florida beggarweed and the Cherokee. The Cherokee is the earlier variety and probably the best adapted to northern conditions.

Beggarweed has become quite popular in the south where it is used for hay, pasture and green manuring purposes. Some authorities claim that it does quite well on acid soils. It has not been tried very extensively in Michigan and should you care to try it would suggest that you do so in a small way. Soybeans, on the other hand, have been tried quite extensively and for the southern half of the lower Peninsula have been found quite satisfactory for hay and green manuring purposes.—Prof. C. R. Megee, Farm Crops Dept., M. A. C.



DETROIT CREAMERY FARM

COMPLETE DISPERSION SALE

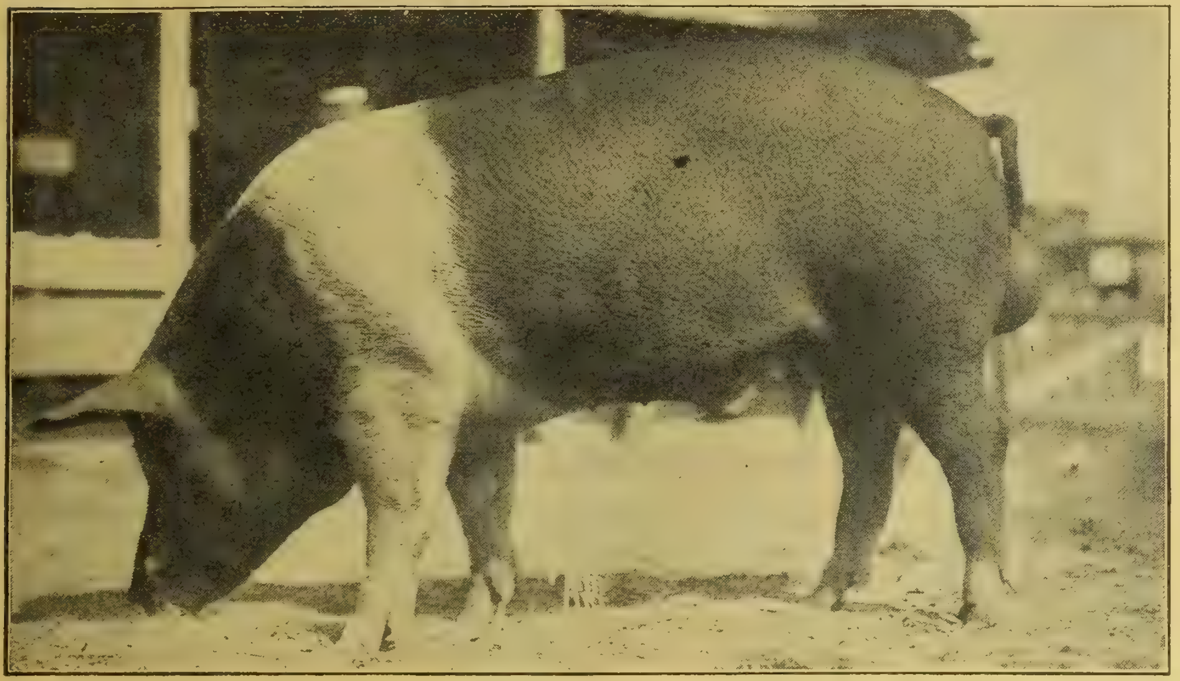
— OF —

ENTIRE HAMPSHIRE HERD

on Monday, March 19th, 1923

CONSISTING OF

27 Tried Sows Bred 13 Gilts Bred 5 Boars



INTRUDER NO. 103987

INTRUDER is considered by expert judges to be the greatest son of the National Swine Show Grand Champion, Messenger All Over, who in turn was the greatest son of that great pillar of the breed, Messenger Boy.

As a show boar he was defeated only by the great General Perishing, Grand Champion of the National Swine Show in 1921. Intruder was Junior Champion at the Ohio State Fair, Grand Champion at Erie, Pa., Dayton, Ohio, Sidney, Ohio, and Troy, Ohio. At Sidney, Ohio, he was placed Royal Grand Champion over all breeds, an honor never before won by an under year Hampshire. He stands a leader of his kind and unapproached. He is a great boar with a great pedigree.

LOCATION—This dispersion sale will be held in Fred Smith's Sale Barn at Utica, Mich.
TERMS—Cash.

GUARANTEE—Every animal is guaranteed a breeder. Every bred sow Guaranteed safe to date of service given should any prove not to be with pig, we will refund 30 per cent of purchase price. Complaint must be made within 30 days.

IMMUNE—The entire offering has received the double treatment for hog cholera and should be immune.

ENTERTAINMENT—Parties from out of town can put up at the Utica Hotel as our guests. Lunch will be served at 11:30 A. M. by the Ladies Aid.

MAIL BIDS—Although we wish all who can to attend this sale, your bids mailed to C. R. Bowers, care of Detroit Creamery Farm, Mt. Clemens, Mich., will be treated honorably.

Every animal purchased by mail will be shipped on approval and if found unsatisfactory, may be returned at our expense and purchaser will be cheerfully reimbursed for full purchase price.

AUCTIONEER—Col. F. H. Hulick, Atlanta, Ind.

FIELDMAN—C. R. Bowers of the Hampshire Advocate. For mail bids address him in our care.

PEDIGREES—Certificate of registry duly transfered will be supplied purchaser, as soon after sale as transfers can be reasonably and correctly made.

ANNOUNCEMENT

It is with the greatest regrets that we announce the dispersion of our entire Hampshire herd.

In our short Hampshire career we have collected some of the finest breeding material that could be found in Ohio, Illinois and Iowa. From the very first it has been our aim to develop one of the best herds of Hampshires. We have always endeavored to keep in mind, the true Hampshire type and all our purchases were made with this in view. One of the important additions to our herd, is the recent purchase of the great boar "Intruder" from C. G. Bitzer and Son at Washington C. H., Ohio, a boar that has one of the greatest show records of the breed. A large percentage of sows and gilts in this sale are bred to him.

We realize that this is the wrong time of the year to dispose of our high class boars, still there is no other course open to us, our loss will be the gain of the Hampshire breeders who attend this sale.

In addition to breeding Hampshires, we have some of the world's finest breeding stock in Poland China's, Duroc Jersey's and Chester White's. The extra labor and expense involved in maintaining four separate breeds is proving to be too much to carry on the business profitably and rather than let any one breed suffer from lack of attention, we are dispersing our most recent addition, namely the Hampshire Breed. We do not wish anyone to infer from this that we think the Hampshire are inferior to any of the other breeds. Even to this day it hurts to sell out all our Hampshire sows and boars that we have become very much attached to. Since we have a larger and more established herd in these other breeds, our loss would be far greater should we dispose of any of the other breeds at one sale.

We want every one who possibly can to be present, if it is impossible to honor us with your presence, we would appreciate your mail bid. Any cooperation you can give us will be greatly appreciated.

Raise all the Chicks You Hatch

Raise them the PAN-A-CE-A way.

Start them right—keep them growing right along without any backset.

PAN-A-CE-A gives chicks good appetite and good digestion—helps them develop rapidly—gives them vigor to resist disease.

PAN-A-CE-A prevents fermentation of the food; fermentation is where most of the bowel troubles start.

PAN-A-CE-A is a gentle tonic to all the little-chick organs—keeps the system in order.

PAN-A-CE-A contains the Salts of Iron, so essential to early chick life, and during the rapid growth of feathers.

PAN-A-CE-A prevents and cures gapes, indigestion, diarrhea and leg weakness.

PAN-A-CE-A your chicks and then watch them feather! A Pan-a-ce-a chick will outfeather a non-Pan-a-ce-a chick every time.

Tell your dealer how many hens you have. There's a right-size package for every flock.
100 hens, the 12-lb. pkg. 200 hens, the 25-lb. pail
60 hens, the 5-lb. pkg. 500 hens, the 100-lb. drum
For fewer hens, there is a smaller package.

GUARANTEED

I spent 30 years in perfecting Pan-a-ce-a

POULTRY

KEEP UP THE GREEN FOOD

THE constant supply of succulent green food must be maintained if you expect the best egg production throughout the summer, and the best growth from the young stock. Hens that have range over the farm do not necessarily secure the right kind of green food. In fact, it has been demonstrated that hens do not eat readily of grass or other range green food later in the summer months when it has lost much of its succulence.

The commercial poultrymen have long since learned that it is just as important to supply green food in succulent form during the summer months as it is during cold weather and they continue to feed sprouted oats. Several articles have been published in these columns in recent issues giving various methods of oat sprouting on large and small scale. For the small flock raiser the best method is to use oat sprouters such as are to be obtained on the market. For large commercial flock use, other methods may be used.

Lettuce from the garden, especially where a succession is planted, can well be used. Lawn clippings, especially clover, are valuable during the summer. Cabbage is not ordinarily to be recommended, although there is no harm in it if not fed to excess.

An abundance of green food is especially valuable for the growing chicks. Too often it is overlooked and the beneficial effects lost. It tends to supply deficient elements in the ordinary ration which, at this season, contains an excess of animal proteins, and it tends also to act as a digestive corrective and purifier.

Green food, on the other hand, is not recommended for use where fowls are to be fattened for market. Most commercial feeders contend that fowls do not put on weight as readily when green food is given.

CURING HENS OF EATING EGGS

We have been troubled with our hens eating eggs. Have you any remedy for this?—J. H., Clare, Mich.

—The egg eating habit is more prevalent where hens are in heavy production and are receiving limited quantities of mineral matter such as is supplied in oyster shell. Close confinement and insufficient straw in the nests also help the spread of this undesirable habit. Poor quality of shell causes the heavy breakage that occurs during production. The eggs are naturally extremely palatable and are greatly relished by the hens. This trouble however, may be continued to such a degree that the hens will actually break the shell in order to get at the contents of the egg.

There is no very satisfactory remedy other than eliminating the ring leaders, darkening the nests and placing plenty of straw in the nests to reduce the breakage as much as possible, and encourage the hens to exercise which keeps them in better physical condition. Oyster shells should be available in liberal quantities which contains mineral matter necessary in shell production. Some people practice doping the eggs with some condiment such as mustard, pepper, etc. to make them unpalatable.—E. C. Foreman, Associate Professor of Poultry Husbandry, M. A. C.

POND NOT NECESSARY

Will you please tell me thru the colums of your paper if a swimming hole is necessary to geese to insure fertility to their eggs?—M. J., Turner, Mich.

—It is not absolutely necessary to have a pond available for swimming purposes in order to maintain or to secure good fertility and hatchability of geese eggs. However, if such a pond is available, the breeding pen should be located near by because of the beneficial results in the increase of fertility and hatchability of the eggs. If a pond is not available, eggs can be produced that are of good fertility although this is less liable than where water is available. —E. C. Foreman, Associate Professor of Poultry Husbandry, M. A. C.

BABY CHICKS

Hatched from strong and vigourous flocks of **ENGLISH WHITE LEGHORNS AND ANCONAS, BRED FOR HIGH EGG-PRODUCTION.** We guarantee 100 per cent [illegible] live chicks on arrival. Postage PAID. Prices reasonable. Instructive Catalog and prices free on request. **QUALITY HATCHERY, Box A11, Zeeland, Mich.**

DAY OLD CHICKS SINGLE and ROSE COMB RHODE ISLAND WHITES. Write for Catalogue. **Fischer's Hatchery and Poultry Farm, R. 1, Holland, Mich.**

POULTRY MANURE A VALUABE BY-PRODUCT

THE average poultry raiser attaches little or no value to the manure produced by his flock. Its gradual accumulation beneath the perches of his fowls receives only occasional attention, in many instances, and even when cleaned out more frequently is thrown away. When its removal becomes necessary he considers it one of the unavoidable and unpleasant evils that go with the business.

But poultry manure has a very real value, and may become a profitable by-product of the plant. It has been determined by the Maine Experiment Station, working in co-operation with the United States Department of Agriculture, that the average night droppings of the medium breeds amounts to 30 pounds a year for one fowl. On this basis 100 fowls would produce 3,000 pounds, or one and one-half tons. The analyses of this manure show it to be especially high in two of the three principal fertilizing elements. If the plant food contained in a ton of average fresh poultry manure were bought at the price paid, usually, for it in the form of commercial fertilizers, the outlay would be about $10.

Taking into account the fact that the quantity of manure produced in the daytime is at least equal to that produced at night, the specialists find that one average hen produces about 60 pounds of manure in a year. However, only the night droppings are available for use, as the day droppings are widely scattered over the yards and ranges. The night droppings from 1,000 hens would be worth about $150 a year. As hen manure, as it usually is cared for, contains only about one-half its original value, the loss thru this form of neglect must be very large for the entire country.

If immediate use is resorted to, the manure should be applied somewhat sparingly. It is from two to three times richer in nitrogen and three to eight times richer in phosphoric acid than the ordinary farm manures. This, of course, is due to the kinds of feeds used, and also to the fact that the liquid and solid matter are together.

It can be handled most satisfactorily if mixed with loam to remove stickiness in the summer. In the winter it should be mixed with a fair proportion of loam, sawdust, or coal ashes, sifted dried earth, land plaster or gypsum. Wood ashes and lime should never be used, as they set free the nitrogen, which must be avoided.

Keep it in a Dry Place

To put the manure on the ground in the winter should mean to lose one-half or more of its value. The better plan is to store it in barrels or boxes until time to use on a growing crop. When stored this way the container should have several large holes bored in it to admit air. Some plants having several thousand fowls have large bins of concrete for saving this manure. Untreated, a large part of the nitrogen escapes into the air as ammonia escapes.

The Maine Experiment Station recommends using with every 30 pounds of poultry manure 10 pounds of sawdust, 16 pounds of acid phosphate and the kainit. The acid phosphats and the kainit prevent the loss of nitrogen, and the sawdust absorbs the excess moisture. If sawdust is not obtainable, dried earth in about the same proportion may be substituted. After being treated in this way the manure should be put in a sheltered place until used. If the materials are kept handy the business of mixing soon becomes a routine task.

FERTILIZERS FOR CORN

FROM 300 to 400 pounds per acre of a 3-12-4 fertilizer is recommended for corn by Director C. G. Williams, Ohio Experiment Station, when neither a clover sod nor manure is at hand to help make the crop. If there is good clover, 300 pounds per acre of an 0-14-4 will answer, while if there is plenty of manure from 200 to 300 pounds of acid phosphate only is advised.

Keep the Business Farmer coming —See page 13.

The Cause of White Diarrhea

White Diarrhea is caused by the bacillus Bacterium Pullorum transmitted through the yolk. There is scarcely a hatch without some infected chicks. The germs multiply very rapidly and one infected chick may infect the entire brood. The germs can be killed by the use of preventitives. Intestinal Antiseptics to kill the germs should be given as soon as the chicks are out of the shell. It is much easier to prevent than it is to cure.

How to Prevent White Diarrhea

Dear Sir: Last spring my first incubator chicks when but a few days old began to die by the dozens with White Diarrhea. I tried different remedies and was about discouraged. Finally, I sent 50c to the Walker Remedy Co., Dept. 683, Waterloo, Ia. for a box of their Walko White Diarrhea Remedy. It's just the only thing for this terrible disease. We never lost a single chick after the first dose. We raised 700 thrifty, healthy chicks, where before we never raised more than 100 a year. I'd be glad indeed to have others know of this wonderful remedy. Ethel Rhoades, Shenandoah, Ia.

Don't Wait

Don't wait until White Diarrhea gets half or two-thirds your chicks. Don't let it get started. Be prepared. Write today. Let us prove to you that Walko will prevent White Diarrhea. Send 50c for box on our guarantee—money back if not satisfied.
Walker Remedy Co., Dept. 683, Waterloo, Ia.

The Agricultural and Business Situation

Revised Monthly by the Department of Research of the American Farm Bureau Federation.

SUMMARY:

Foreign demand is the most uncertain element in the agricultural situation. Purchases by Europe have a determining influence upon the prosperity of the producers of wheat, cotton, pork and tobacco, and affect—to a lesser extent—other agricultural groups. What is the condition and outlook in regard to European purchasing power?

The principal ways in which our exports of commodities, the last two years, have been paid for, are as follows: (1) by imports of commodities; (2) by imports of gold; (3) by extending credit, particularly long-time credit through the purchase of foreign bonds. During these two years exports of goods have totaled 8,144 million dollars. Import figures for 1922 are not yet complete but, for the two years, will be close to 5,509 million dollars. This makes an excess of exports over imports of 2,635 million dollars, which was paid mainly by net imports of gold, for the two years, of 906 million dollars and the purchase of new foreign bonds of 1,463 million dollars. The situation for each of the two years was as follows:

	1922	1921
Exports of goods	3,765	4,378
Imports of goods	3,000*	2,509
Net imports of gold	238	667
New foreign loans	769	694

*Partly estimated.

Note that exports in 1922 are less than in previous year; imports are higher; net imports of gold are less; new foreign loans are slightly more. If exports of commodities are to be maintained or expanded as is desired, one or all of the other three items must be maintained or expanded. The last item in the list, namely, new foreign loans, has declined sharply in recent months, only 23 per cent of the loans for 1922 being made in the second half of the year. Net gold imports cannot be expected to continue indefinitely and there is no reason to think that they will increase in 1923. Europe is probably in a position to send us as many goods in 1923 as last year but much of an increase would be surprising. These factors, combined, point to a diminution of export demand in 1923. At least it will be conservative for farmers to lay their plans on the basis of a strong possibility that foreign demand for cotton, wheat and pork will be less than last year. This need not be true if improvement in European conditions increases production abroad and brings a return of confidence among American investors.

Cotton will start the new crop year with practically no carryover. With the price of cotton around thirty cents per pound the incentive will be strong to plant a large acreage. Also with the price high, fertilizers and poisons will be applied more generously. The weather and boll weevil may restrict output in spite of the factors tending to increase it. A crop of 12 million bales, the average for 1916-1920, would probably not prove excessive even with lower exports.

The proportion of wheat exports to production was 27 per cent in 1922 compared with 43 per cent in 1921 and 23 per cent for the twenty year average. With Russia and the Danube countries still out of the European market, the small volume going out of the United States in 1922 was disappointing. This was partly due to an excess supply in Canada and Argentina and the substitution of corn and other cheaper grains. Europe has had two short grain years in succession and will need our grain badly in 1923. With purchasing power low, Europe can be expected to continue to give preference to our cheaper grains. With wheat prices unsatisfactory, winter wheat acreage was cut three per cent and it is anticipated that the spring wheat area may be reduced.

From reports of the United States Department of Agriculture, we may conclude that the number of hogs raised for market in 1923 will be about 15 per cent larger than last year. Pork and lard exports are now making up about 15 per cent of production compared with an average around 11 per cent before the war. Exports in 1922 show a slight decline from previous year. With an indication of a large supply of pork products in 1923, larger exports than last year would seem necessary to sustain the market.

Eggs	229	239	265
Butter	162	155	152
Wool	211	199	101

4. Relative Purchasing Power of Farm Products:

The quantity of various commodities which a given amount of each farm product would purchase at prices prevailing in 1913 is put equal to 100. The figures given represent the percentage of this quantity which the same amount of farm products would purchase in December, 1922. Prices at the farm are used for agricultural products, and wholesale prices at central markets for other commodities.

	All Commodities	Cloths, etc.	Fuel, etc.	Metals, etc.	Building Mtls.	House Furn'gs
Cotton	127	102	92	151	107	109
Corn	75	60	54	89	63	64

MARKET FLASHES

MARKET SUMMARY

Wheat steady. Corn and oats unchanged. Beans quiet after small decline on opening day of week. Supply of butter moderate and demand good. Receipts of eggs exceed demand. Potatoes firm. Poultry steady. All live stock steady to active and higher.

(Note: The above summarized information was received **AFTER** the balance of the market page was set in type. It contains last minute information up to within one-half hour of going to press.—Editor.)

FOOTE'S MARKET LETTER

By W. W. Foote

THE cost of living is increasing and is much higher than a year ago, and farmers are complaining of their great increase in taxes above pre-war years, while their farm profits have been far lower. A matter of interest to dairy farmers is the recent arrival in New York of a cargo of 5,320,000 pounds of butter from New Zealand, and the arrival the same day of 2,500,000 pounds of poultry in the same city from California, both by way of the Panama Canal. It was stated at the same time that a fleet of butter carrying ships was on the sea carrying nearly 10,000,000 pounds of New Zealand butter destined for consumption in this country, and predictions were made that it would force prices for domestic butter lower. According to an agreement between the Chicago milk distributors and the milk producers association, composed of dairy farmers in Illinois, Wisconsin and Indiana, the wholesale price fell ten cents per hundredweight a few days ago, the new rate to be in force until the first of May. The new price of milk for twelve gallons of milk fell from $2.50 to $2.40. No reduction was made in prices to consumers.

Grain on Farms

Reserves of grains on farms in the United States on March 1 aggregated 1,706,000 bushels of wheat, corn, oats, rye and barley, as given by the government report, being 187,000,000 bushels less than last year and 822,000,000 bushels under two years ago. It is estimated that reserves are ample for domestic and normal export requirements until the next crops. An increased percentage of the wheat crop was moved from the farms this season, this amounting to 67.1 per cent, comparing with 61.7 per cent last year and a ten years average of 57.7 per cent. One-third of the wheat reserves are held in the four northwestern states. amounting to 51,706,000 bushels, of 24,700,000 bushels more than last year. Corn supplies on the farms of 1,087,000,000 bushels were 210,000,000 bushels less than last year and 477,000,000 bushels less than two years ago. A heavy consumption of oats is shown by reserves of 421,514,000 bushels.

Prices for wheat hold up remarkably, although sales are made far below the prices paid one and two years ago. Sales are made of May delivery wheat in the Chicago market around $1.20, comparing with $1.37 a year ago. May corn sells at 74 1-2 cents, comparing with 62 1-2 cents a year ago; May oats at 45 cents comparing with 39 1-2 cents last year; and May rye at 83 3-4 cents, comparing with $1.06 1-2 a year ago.

Cattle in Moderate demand

The only way that will keep prices for cattle from declining is for stockmen to market their holdings moderately, avoiding large shipments at one time. Many more cattle are reported as feeding in the corn belt than a year ago, and because of the comparative cheapness of hog products, they are largely substituted for beef. The present tendency of cattle prices is to narrow, very few prime beeves being needed to meet the demand, and late sales of beef steers offered on the Chicago market were largely at a range of $7.75 to $9.50, with the best lots at $9.50 to $10, a few head of 1135-pound long yearlings fetching $10.40. Steers grading as good are salable at $9 and over, medium grade lots going at $8 and over, and sales down to $6.40 to $7.75 for common to fair lots of light weights, a few inferior little steers fetching $4.25 to $6.25. The packers compete with country buyers for fleshy feeders, a moderate business being carried on in stockers and feeders at $5.25 to $8.40, sales being principally at $6 to $7.75. Most stockmen hesitate about loading up with thin cattle at high prices, as they are afraid of the future market for finished cattle. Spring calves have been marketed liberally, causing bad breaks in prices, with recent sales at $5 to $11.50. Prime heavy steers and fancy yearlings sell at $10. Most cows and heifers sell at $4.50 to $6.50, prime heifers going at $8 to $8.75. A year ago the best steers sold at $9.40 and eight years ago at $8.75.

Excessive Hog Supplies

Stockmen owning hogs and cattle are marketing rapidly, being opposed to a long feed, and hog receipts are especially large, causing frequent declines in prices. Eastern shippers are purchasing a much smaller proportion of the swine offered on the Chicago market than several weeks ago, and lack of competition between buyers has favored the decline in prices. Comparisons with prices pair a year ago show a big decline, the top at that time having been $11.50, the high point for 1922, but last November the best hogs sold down to $7.85. There has been a marked increase in the marketing of pigs and underweights, and the spread in prices has narrowed materially, the bulk of the hogs selling within a range of 35 cents. Prime light bacon hogs still top the market, selling 25 cents above the best heavy butchers. Recent Chicago receipts of hogs averaged 229 pounds. The principal bullish factor in the hog trade is the extremely large consumption of lard and fresh and cured meats at home and abroad, exports continuing much heavier than a year ago. During last week Chicago received 215,650 hogs, comparing with 194,865 a week earlier and 150,798 a year ago. And yet the good demand put prices higher, closing sales being made at $7.25 to $$8.65, comparing with $6.90 to $8.45 a week earlier and $9.50 to $11.30 a year ago.

Early Spring Lamb Supply

The early spring lamb supply available for the markets of the country promises to be materially larger an to start to market earlier than last year, according to the Bureau of Agricultural Economics. This applies to lambs which go to market before the first of June. California lambs are expected to arrive in the markets in large volume in April, while marketing from the southwest will not be well under wav until May. Marketings from Tennessee and Kentucky for April and May promise to be larger than last year and about the same as in 1921. Last fall the number of breeding ewes in those two states was estimated as 7 per cent larger than a year earlier, and earlier breeding than usual was the rule. Lambs from Virginia will move later than the Tennessee and Kentucky flocks. Such states as Iowa, Illinois, and southern Ohio begin marketing lambs in June. These lambs are dropped mostly in February and March. Ewes generally wintered well, and are in good condition all over the corn belt, feed being plentiful. Shed lambs dropped in February and March in Idaho begin to go to market in June. Wooled lambs are selling in Chicago at $12.75 to $15.25. The University of Wisconsin had a car load of superior fed western lambs that averaged 87 pounds on the Chicago market recently that sold at $15.25, the top price. Sheep are making much more money on the Wisconsin farms than either cattle or hogs, both lambs and wool selling extremely high. Shropshires lead other breeds, but Cheviots are becoming more popular in parts of Wisconsin.

WHEAT

Prices in the wheat market fluctuated considerably during the past two weeks. The forepart of this period the trend was downward and during the last week prices have advanced until at Detroit they closed last Saturday within 1-2c of the closing price on the same market two weeks previous. During the entire time the news circulated about the market was very bearish, but it appears that bearish news has been used so long to bear the market that it is losing influence on prices. The wheat outlook, as far as present wheat is concerned, could not be much more bearish, but that has been the case for a long time and no attention is paid to it. Strength is coming from the new crop outlook, which is far from favorable. The southwest needs rain and any precipitation in recent days has not been over the dry districts. This is the most important point in the grain situation and will be for some weeks or until spring weather has definitely developed the strength of the plant.

Foreign news is more favorable to the constructive side of wheat, but export buying has not yet given much evidence of returning life. Some bullish dealers believe they see an early end of the Ruhr trouble. The invasion of Germany by France is held as the reason why Europe is not buying American wheat and it is believed the buying would be resumed should the French settle up and go home. Foreigners took about half a million bushels of durum wheat last week, buying it at Minneapolis. James A. Patten says: "I believe that the whole question of a continued movement back to general prosperity rests upon a return to the former relation between the price of farm products and such commodities as the farmers need to buy. I regard corn as the keystone of the agricultural arch and fortunately every condition appears present for a price range for the rest of the year that will do much toward restoring the farmer to his position of the greatest element of purchasing power in our population."

Prices

Detroit—Cash No. 2 red, $1.35½; No. 2 white, $1.35½; No. 2 mixed, $1.35½.

Chicago—Cash No. 2 hard, $1.19½@1.20½; No. 3 hard, $1.19.

New York—Cash No. 2 hard, $1.34; No. 2 mixed, $1.25.

Prices one year ago—Detroit, No. 2 red, $1.37; No. 2 white, $1.34; No. 2 mixed, $1.34.

CORN

Corn showed more strength on the closing day of last week than probably at any time during the past two weeks and considerable grain changed hands as demand was active and selling of good volume. Bearish news has dominated the market recently but a bullish statement was given out that offsets the bearish influence. Mr. James A. Patten, in discussing the domestic needs after March 1 to the new crop, stated that our present corn reserve of 1,089,000,000 bushels is short by 119,000,000 bushels of our actual consumption during the last two years. Receipts are smaller than expected.

Prices

Detroit—Cash No. 2 yellow, 79c; No. 3, 77c; No. 4, 75c; No. 5, 73c.

Chicago—No. 2 mixed, 74@74½c; No. 2 yellow, 74½@75½c.

New York—No. 2 yellow & No. 2 white, 93c; No. 2 mixed, 92½c.

Prices one year ago—Detroit, No. 2 yellow, 64½s; No. 3, 63c.

OATS

Oats are quiet and steady with the Detroit price at the same level as two weeks ago. Cash oats are reported in good demand.

Prices

Detroit—Cash No. 2 white, 49½c; No. 3, 48c; No. 4, 46½c.

Chicago—Cash No. 2 white, 46@46¾c; No. 3, 44@45½c.

New York—Cash No. 2 white, 56c.

Prices one year ago—Detroit, Cash No. 2 white, 42c; No. 3, 40c.

RYE

Demand in the rye market is light. Export business is at a standstill and indications are that it will remain that way until some kind of a settlement is arrived at in the sections where war threatens. Domestic demand is very light and has been for some time. The future trend of rye will depend much on what the other grains do.

Prices

Detroit—Cash No. 2, 84½c.

Chicago—Cash No. 2, 83½c.

New York—Cash No. 2, 96c.

Prices one year ago—Detroit, Cash No. 2, $1.02.

BEANS

The bean market continues steady in tone with prices unchanged. Trading is rather quiet at present but it is expected to show more activity soon.

Prices

Detroit—C. H. P., $7.75.

Chicago—C. H. P., $8.00@8.25.

Prices one year ago—Detroit, C. H. P., $6.65.

POTATOES

Potatoes are firm in spite of the fact that receipts are in excess of the demand. Prices are higher at many points than they were two weeks ago. Receipts on western markets are small while markets in the east are plentifully supplied. Dealers are inclined to be backward about buying more than for immediate needs as they feel that prices should go lower.

Prices

Detroit — Michigan, $1.17@1.33 per cwt.

Chicago—Wisconsin round white, 90c@1.00 per cwt; Idaho russets, $1.15@1.35.

Prices one year ago—Detroit, Michigan, $2.06.

HAY

Markets have been steady with a decidedly stronger feeling in the central western section. The stormy weather had a strengthening effect on most markets as the demand picked up and arrivals delayed. The eastern terminals report slightly larger receipts and prices have softened a trifle from a week ago.

Prices

Detroit—No. 1 timothy, $16@16.50; standard, $15.50@16; light mixed, $15.50@16; No. 2 timothy, $14@15; No. 1 clover mixed, $13@14; No. 1 clover, $13@14.

Chicago—No. 1 timothy, $21@23; light mixed, $18@19; No. 2 timothy, $17@19; No. 1 clover, $13@15.

New York—No. 1 timothy, $27@28; No. 2 light mixed, $24@26; No. 2 timothy, $25@26.

Prices one year ago—Detroit, No. 1 timothy, $19@20; standard, $18@19; No. 2 timothy, $17@18; No. 1 light mixed, $18@19.

Alfalfa—Chicago, No. 1 and choice, $23@25; No. 2 standard, $15@19.

MRS. BERTHA HALLADAY, Ashton, Michigan.

FOR SALE—GIANT BRONZE TURKEYS FROM Michigan's best strains. Large healthy birds. **MRS. LAVERNE BROWNELL, R. 1, Belmont, Mich.**

FOR SALE—WHITE HOLLAND TURKEYS. Write for prices.
MRS. DON ROSS, R. 6, Mariette, Michigan.

MAMMOTH PEKIN DUCK EGGS FOR SETTING $2.00 or two settings $3.00. Also Wild Mallard Duck eggs same price. Very choicest stock. All orders prepaid. **Cedar Bend Farm, Okemos, Mich.**

WOOL

Wool prices in the middle west remain on a steady to firm basis, with trading of good character, though not of very large volume, on account of the shortage of stocks. Reports from the west indicate that growers are inclined to hold for good prices, better financing arrangements and the general feeling of optimism being factors in this tendency. Throughout the country the trade seems to feel confident that wool prices will be steady to firm this spring season.

WEEKLY MARKETGRAM

U. S. Bureau of Agricultural Economics

Washington, D. C.—For the week ending March 10, 1923.

FEED—Demand quiet. Deliveries of wheat feeds by flour mills heavier and track stuff is available in Minneapolis. Cottonseed meal market weak; transactions small. Exporters bid $46.50 for slab cake delivered Gulf Ports. Fair feeding demand from west. Hominy feed offerings exceed demand and prices are easier. Gluten feed unchanged, demand fair, production heavy. Linseed meal in liberal supply at lower prices. Interior demand fair. Storage stocks of wheat feeds good. Movement light. Quoted March 9—bran, $28.-25, middlings $28.50, flour middlings $30, Minneapolis; 36 per cent cottonseed meal $40.50, Memphis, $41.50 Atlanta; 34 per cent linseed meal $47.75, Minneapolis; $48.75 Buffalo; gluten feed $42.65 Chicago; white hominy feed $29 St. Louis, $29.50 Chicago.

Why are we buying western apples by the pound, when our own Michigan apples rotted on the trees last fall?

PRITCHARD'S WEATHER FORECAST
INTERPRETED BY THE STARS

Week of March 18

MILD weather coming at the end of last week or beginning of this will be followed by a cold wave, temperatures falling to between 10 and 15 degrees above zero on or before Tuesday the 20th. Heavy local rains will change to sleet and snow which is liable to cause local hinderances to trafic or communication. The winds at this time will also be high.

About Wednesday temperatures will begin to moderate rapidly in this state and during Thursday or Friday one may expect showers or snow flurries.

At the end of this week there will be another change to colder but we do not believe it will be as severe as the previous low temperature period.

Week of March 25

Cold, fair days and nights will be the rule during early part of this week but by Tuesday or Wednesday light rain or snow will be in evidence in Michigan. Unsettled conditions will continue for the balance of the week but we believe there will be about or a little above the average amount of clear sky, notwithstanding.

Beet Sugar Outlook

The outlook for the Michigan sugar beet sugar content is fairly promising judging by what we believe the weather will be during the coming summer and fall. It will not be however, the best kind of a sugar beet year for all parts of the state.

While the rainfall will be heavier during some of the summer months than others, we believe June, July, August and September as a whole will average about normal.

We estimate that a very late planting of sugar beets in Michigan will produce a greater tonnage that the early seeded crop and that the sugar content will be equally as good.

FOUR TOULOUSE GEESE FOR SALE. ONE year old this Spring.
MRS. JOHN BLOCHER R. 3, Woodland Mich.

HATCHING EGGS
S. C. White Leghorns. Tom Barron Strain, 250 egg utility line. November to April, average 65 per cent. Pure white plumage. Range grown, healthy, vigorous stock. Eggs $1.50 per 15; $4.00 per 50; $7.00 per 100. Prepaid. Limited supply. Order from this ad now.
MAPLEWOOD POULTRY FARMS
C. W. Bovee, Prop. **North Star, Michigan.**

No Other Mixer Like It

a Batch a Minute
As pioneer mixer manufacturers we have developed two features that put the Gilson Mixer in a class of its own. It is the only mixer with **Patented Reverse Unloading Gear and Curved Mixing Blades,** insuring thorough mixing in shortest time. Loads on one side, dumps on the other side.

Gilson Concrete Mixer **30 Days FREE Easy Terms**

Due to the special **Curved Mixing Blades** the Gilson thoroughly mixes in ⅓ the time required by the ordinary type of mixer. Handles 2½ to 3 cubic feet of concrete at one time at the rate of one batch per minute. Turns out 34 cubic yards in ten hours. Mixes perfectly concrete, mortar or plaster. Any 1 H. P. Engine turns it easily.

Only $43.50 DIRECT TO YOU

The lowest priced, practical, improved mixer made. Built of iron and steel—lasts a lifetime. Ideal for farmer or contractor. Mixes concrete that requires no replacements, no repairs. Use this mixer 30 days at our risk. We guarantee it exactly as represented. Send your name today and get full description of this, the only Reverse Unloading Gear Mixer, and easy payment plan.

Current Agricultural News

BIG TURN-OVER IN FARM OCCUPANTS LAST YEAR

NEARLY 1,250,000 farms, or approximately one out of every five farms in the United States, changed occupants in 1922, according to a survey made by the United States Department of Agriculture.

In 9 southern states one farm in every four changed occupants; in 6 states in the New England group the turn-over was one farm in every ten, and in most of the corn belt and western states between 10 and 15 per cent of the farms changed hands.

Changes in ownership of farms took place on nearly 400,00 farms, or approximately one farm in every sixteen in the United States. In general, more farms changed owners in the west and south than in the New England, Middle Atlantic and Corn Belt states.

Of the 2,300,000 or more farm tenants in the United States more than 625,000 changed the scene of their operations during the year. More than 75 per cent of these tenant changes occurred in the 15 southern states.

Although the number of tenant farms in United States shows a net increase of 27,000 for the year, more than 230,000 tenants either discontinued farming for some other occupation or left their communities for parts unknown to the department's correspondents. A percentage decrease in tenant farms is shown in only 10 states; in 2 states the percentage was unchanged. In general, the largest exodus occurred in the south and west.

A. B. COOK TALKS TO GRANGERS

A. B. COOK, Master of State Grange, was the speaker at the Huron County Pomona Grange hall, Thursday, March 15th. The Grange, he said, is the only national farmers progressive organization that has stood for 50 years and is really doing things to educate the farmer so that he delights in raising No. 1 products and then can demand eventually a No. 1 price in proportion to the prices he has to pay for what he needs.

One of the things that the Grange is striving for is a fertilizer plant which will be operated by the inmates of the State prison. This will not interfere with any Michigan business as practically all of our fertilizer is manufactured outside this state. This will materially benefit the Michigan farmers as it will lower the cost of fertilizer to the user.

The Michigan State Grange at the present time has a contract with the prison to use its binder twine. They also have a contract with the State of Minnesota for farm machinery. This machinery is made by prison labor.

AMERICAN CORN HANDICAPPED IN EUROPE

EUROPEAN corn millers and stock breeders believe that the meal obtained from the Argentina hard flint corn is more nutritious than that obtained from the yellow and white corn shipped from the United States. Consul F. F. Dumont, Frankfort-on-Marne, Germany informs the Department of Commerce that the Argentine product is reputed to be better dried and to have better keeping qualities than American corn. The nutritive qualities of the two stocks are tested abroad by putting equal quantities of the different varieties in containers and pouring water over them. As Argentine corn absorbs more water, it is considered the better.

CANADIAN RAILROAD WILL HELP FARMERS

NEW plans, never before tried, to increase immigration into Canada from European countries are being put into effect by the Canadian Pacific Railway. Printed forms for the use of farmers have been distributed throughout Canada. These are to be filled out by agriculturalists requiring help, setting forth the nationality of the help wanted, male or female, wages, kind of work, and so on. With the direct demands of the farmers to guide them, officials of the Canadian Pacific Railway will undertake to deliver immigrants who will fill the requirements.

ANNUAL MEET OF HURON CO. SHORTHORN BREEDERS

THE Huron County Shorthorn Cattle Breeders' Association annual meeting and banquet Wednesday night, March 7th, at the Irwin House was a blinger. It easily topped anything of the kind previously held here. A few over 100 sat down to the well filled tables after singing "America."

Community Club members were invited guests, of whom about 40 were present. Cattle men representing the Holstein and Hereford county associations were also guests. County Agent E. E. Twing presided and he certainly made it snappy. There was surely a flow of soul that kept the feast of reason guessing, but the great and growing cattle industry of Huron county was ever kept to the front, as it is all over Michigan.

S. H. Pangborn, president of the State Shorthorn Association, was the first speaker. He commended the get-together spirit so manifest the past year among farmers, stock men and town people and paid some nice compliments to the Community Club.

Prof. W. E. Edwards of the M. A. C., talked on the present day business farmer and the person that at one time was known to the city people as a "hay seed." He was followed by Dr. J. S. Wurm, of Pigeon. president of the State Veterinary Association, who gave a short talk which created much laughter and at the same time gave the listeners some valuable pointers on the raising of stock. Mr. R. A. Turner, state leader of Boys' and Girls' Club Work, discussed the club work in Michigan and told how it was helping to keep the boys and girls on the farms. Mr. W. H. McCarty, leading Hereford breeder of Huron county also gave a talk that will be remembered. Musical features followed the speaking and after that the program was concluded with a picture reel on stock and farm topics by E. E. Twing and C. M. Horn.

GOVERNMENT BULLETINS OF INTEREST IN APRIL

A SMALL list of Farmers' Bulletins and Circulars of general interest during April is belived to be of value to our readers. Copies may be obtained free by addressing the Division of Publications, United States Department of Agriculture, Washington, D. C. Specify number and name and whether Farmers' Bulletins or Department Circular.

Government Millions Available for Farm Credits

Judge Lobell, Head of Farm Loan Board, Explains New Credit Legislation Passed by Last Congress— Question Now is: Can Farmers Use It to Practical Advantage?

TWELVE million dollars is ready to be turned over by the U. S. Treasury to the twelve intermediate credit banks of the Federal Farm Loan Board immediately the charters are issued. The $60,000,000 capital authorized by the new law for the banks has been automatically accredited to the Farm Loan Board by the Treasury, according to Secretary of the Treasury A. W. Mellon.

The Federal Farm Loan Board has completed the regulations which will serve as the guide for the system's operations in aid of the farmer. Temporarily, at least, the board plans to hold loans made under the new law to a basns of nine months' maturity. Judge Charles E. Lobdell, executive of the Farm Loan Board, is quoted as follows:

"It is the ambition of those charged with the administration of the new law to render maximum service, but elemental safety must be the first consideration. Banks and cooperative associations desiring to use the service and see it developed will make their best contribution by offering nothing but perfectly good paper.

Direct Loans to Co-Ops.

"Direct loans cannot be made to individuals. Direct advances may be made to co-operative marketing associations or livestock associations secured by warehouse receipts for staple agricultural products or by chattel mortgages on livestock.

"No such loan may exceed 75 per cent of the market value of the agricultural product or livestock.

"Loans may be rediscounted for national and state banks, savings banks, trust companies, agricultural credit corporations and incorporated livestock loan companies.

"No paper can be rediscounted upon which the borrower has been charged a rate more than one and one-half per cent in excess of the discount rate of the intermediate credit bank of the district.

"In making advances on warehouse receipts, the credit from bonded government warehouses or satisfactorily bonded warehouses operating under satisfactory State supervision and regulation. This should lead to broader interest and greater activity in the development of warehouse facilities and proper regulation.

Will Promote Co-Operation

"The facilities which the banks will be able to afford to co-operative marketing concerns should lead to a greater development of such enterprises.

"Ample funds will be available for loans to facilitate original marketing but none to support speculative holding of farm products.

"No loans will be made for a longer period than 9 months, until the system is thoroughly tried out. Upon livestock paper, satisfactory assurance of renewal will be given in proper cases but only in aggregate amounts equal to the bank's capital, and then the subject of the mortgage must submit to reinspection and a satisfactory condition of security provided."

Many writers and students of economics fail to see where the present legislation is going to help the small farmer and stock or fruit grower such as we have in the middle west, they are not optimistic as Judge Lobdell, that all is well, but they are generally agreed that the opportunity is now presented for the measure to be tried out and if found wanting, it can be so altered as to meet the needs of actual conditions.

ANALYSIS OF CREDITS LAW

THE American Farm Bureau Federation submits the following brief analysis of the rural credits bill:

(1) The maximum loan which may be extended to one borrower by the Federal Land Banks raised from $10,000 to $25,000. The larger loans under the Federal Farm Loan System have been made by the joint stock land banks. Under the new legislation, the Federal Land Banks will be able to make these loans and the borrower will get the money about 1 per cent cheaper.

(2) Intermediate credit departments are established in each of the twelve Federal Land Banks. These departments may extend loans for agricultural and livestock purposes from six months to three years. They may make loans directly to co-operative associations. They may discount for or buy from any state or national bank or trust company, co-operative marketing association, livestock company, or agricultural credit corporation, notes, bills, drafts, etc., the proceeds of which have been advanced or employed in the first instance for any agricultural purpose or to raise, breed, fatten, or market livestock. These departments may issue and sell tax-exempt collateral trust debentures with a maturity of not more than five years.

(3) National agricultural credit corporations, with a minimum capital of $25,000, may organize under the jurisdiction of the Comptroller of the Currency. They may make loans, rediscount, purchase or sell, commercial paper and also accept drafts drawn for agricultural purposes, or the principal of which are to be so used. The notes and drafts are to be secured by warehouse receipts or other documents conveying title to unperishable and readily marketable agricultural products, or by chattel mortgages or other similar instruments conveying a first lien upon cattle being fattened for market; such notes and drafts to have a maturity when purchased, of not more than nine months. These credit corporations may also make advances upon, discount, etc., notes secured by chattel mortgages upon breeding stock and dairy herds, such notes to have a maturity at time of discount of not more than three years. The corporation may issue collateral trust notes or debentures with maturities not exceeding three years. National agricultural credit rediscount corporations may also be organized under the Comptroller of the Currency with capital stock of $1,000,000 or more, for the purpose of rediscounting notes, drafts, etc., for the national agricultural credit corporations.

(4) Federal Reserve banks may now rediscount agricultural and livestock paper having a maturity up to nine months.

(5) The War Finance Corporation has been extended to April 1. 1924.

It is now possible for agriculture to borrow money for production purposes for a period of time long enough to cover the regular production process. Heretofore, farmers have borrowed on the same basis as merchants and manufacturers who needed credit for only thirty, sixty, or ninety days, or six months at the most. Farmers may need credit for the entire growing season and after harvest may wish to hold the crop for a favorable time to market. This is likely to require a twelve or eighteen months loan. For raising livestock a loan as long as three years may be desirable.

Shall We Plant Our Late Potatoes Earlier?

By R. R. ROSSMAN, Lakeview

I HAVE often heard that late planted potatoes outyielded early planted ones. Our experience is contrary to this. We find with the Russet Rurals that the earlier they are planted the greater the yield. This we find is a practical advantage in favor of early planting. Of course we usually have a drouth in August and these early planted potatoes have quite a top by that time and are using a lot of moisture. If one has followed good farm practices up to this time and has lots of organic matter in the soil, it will be a very protracted drouth indeed that will reduce the crop to or below the level of the late planted patch.

An early planted potato stands up under hauling better than a late one at harvesting time and is the only kind fit to go on the fall market. If the late planted potato is given time to ripen in the bin before marketing, I see no objection to late planting from this angle, but we all know that a lot of immature stock is dumped on the market every fall and the general potato market suffers from it. I don't think a late planted potato should be allowed in braded sacks until it has ripened in the bin.

Field frost cost us hundreds of thousands of dollars last fall. Had our potatoes been planted early, we would have escaped a lot of this as they would then have been dug and out of danger before the frost came. Then if those that were waiting for the frost to ripen their potatoes had been compelled to store them for a few weeks in bins and pits before marketing, we could have gotten entirely away from this loss. If our potatoes were all pooled, too, our growers would lose interest in this idea of rushing their spuds on the market and we could market the ripe potatoes first, and let the immature spuds ripen in storage.

In 1921 we had a great demonstration of the advantage of early planting over late, in another way. We had the hottest June on record. Those who planted before June seventh obtained a good stand and harvested a ripe even sized crop. After June seventh, because of the heat, seed potatoes deteriorated very rapidly as the ground dried out deeper and deeper. The result for the late planter with their weakened seed planted in the hot soil, followed up with a cloud burst that packed the soil, was about a 50 per cent stand. When the harvest came they got a lot of pumpkins, fit only for hog feed.

The earlier you get your seed in the ground the more vitality it has, but be sure it is treated with corrosive sublimate and is disease free if you would reap the full benefits of early planting.

Diseased seed will not have as good a chance of infecting your crop when planted late and harvested early, but why plant diseased seed?

To summarize—If you would reap the advantages of early planting, plow in the fall, fit like a garden, plant disease-free seed, cultivate shallow and spray continually. If the field has good under drainage and is full of humus you are "sitting pretty" as far as yield and quality are concerned.

If you are bound to put a piece of thin land into spuds and your source of seed is questionable; and if you don't believe in spraying, even for bugs, plant 'em late and sell 'em to any old line dealer. He will pay you just as much as he would if they were good for humans to eat.

WOOL MARKETS FOR 1923

LAST year the mills and Eastern wool buyers felt that the local buyers put one over on them by advancing prices during the buying season and charging the full advance of purchased wools to them. The local dealer made, as one expressed, "a barrel of money," and in many cases made up the losses which were heavy in 1920. This year the East has said "that this must not happen again" and are paying steady to higher prices for imported wool, and acting real indifferent to the new clip. This is part of the play. Foreign markets are higher proportionately than Boston. Imports at Boston for the first week in March were 15,374,600 pounds; almost 1-10 of the U. S. production. There is a world's shortage of wool; 10 per cent, as compared with the five years pre-war average, and a 15 per cent shortage of wool in North America. In the U. S. from 1909-13 the average was 314,110,000 pounds; in 1921, 273,064,000 and 1922, 261,095,000. Western wool producers are standing firmer for what is more than equivalent to 50 cents a pound in Michigan, freight, shrinkage and quality considered. These men are asking that Ohio and Michigan do not cut the ground from under them by selling at a less figure. There is no better wool in the world than is produced in Ohio, Michigan and portions of adjoining states. Austrailian wool comes to the mills, skirted or with the legs and belly wool trimmed off. In this sense it is preferable, but the new tariff makes it cost proportionately more. Prior tariffs were practically of no protection to the American grower, when skirted prior to exportation, and the rejected portions were sent to free trade countries. Rejections and discount wool is a trade practice which has made undue exactions from the grower for burry, seedy and choffy wool. Importers of carbonized wool did not want to have this stock considered as anything but clean content wool, claiming that carbonizing was merely a cleansing process and the cost was normal. The treasury department however ruled that carbonized wool was partially manufactured and must pay the higher duty. Unreasonable penalizing of chaffy and burry wool belongs to the past if growers would stand firm. Eight to ten cents per pound is a very liberal discount. Fifty cents per pound for average clips of wool should be the growers price this year.—Jas. N. McBride, Pres. Mich. Sheep Feeders and Breeders As

Preventing the Potato Landslide

Northwestern Writer Tells what Happened and How Cooperative Associations Plan to Avoid Catastrophe in 1923

BY M. L. BIGELOW

WHEN THE POTATO CROP OVERFLOWS!

There is no market for the over-production and those that are not needed to fill the market, serve only to demoralize the normal market, so no fair price is paid for the entire crop and growers must sell at less than it cost to produce.

MR. MURPHY is sick. He has an obscure ailment. Doctors from seven states have been in consultation and, as doctors sometimes do, both agreed and disagreed as to Mr. Murphy's symptoms. Some thought he should have an operation, some that his physical system needed regulating, but all agreed that he'd been over-exerting himself and needed to relax a bit.

"What under the sun is she talking about?" I hear you exclaim. Why about our humble friend, Mr. Potato Murphy, to be sure. Of coarse you know he's ailing. Getting down to cases, here's the story.

Several years ago, three or four to be exact, potato producers became aroused to the fact that their product was subject to competitive juggling of prices, discriminatory shipping agreements, hazy and biased inspection reports and various other manipulations, most of them decidedly unfair.

As a cure-all for these troubles it was thought a good system of co-operative marketing would meet the needs. A great step in improvement was soon noticeable. Michigan first, then other in the "potato belt" organized and started to work with zeal and promised such noteworthy results that the enthusiasm surged back and forth all along the line. It took root on the farm and in the small market town; great waves of it lapped the studious halls of agricultural colleges and the public mind focussed on Mr. Murphy gave a little bit of an inflated idea of himself.

An Interesting Conference

Minnesota having bumped the bumps probably fully as much as any locality in the Northwest, The Minnesota State Department of Agriculture on January 12, 1923. called a potato conference of the states of Michigan, Wisconsin, North and South Dakota, Montana, Nebraska and Minnesota, the 9th Federal Reserve Bank and the National Markets Committee.

The purpose of the call was to consider ways and means to better the marketing conditions in the potato industry in the northern group of potato growing states, by means of better diversified farming, or by better enforcement of grade quality by state grading or by improved car service, or by co-operative marketing control of crop thru binding contracts calling for quality, time and place delivery, warehousing and financing.

Delegates from four of these states were present and two others while not able to be at the meeting signified their desire to co-operate and to work together instead of competitively.

Those who sat in at this discussion were able to visualize the status of the industry. As one speaker after another spoke and different phases of the problem were presented one could not fail to realize the magnitude of the work ahead, and its absolute necessity if potatoes are to continue to be an important crop in the Northwest.

Co-operative marketing, that magic idea, so potent when accompanied by its able lieutenants, efficient and controlled production and expert handling, so helpless when standing alone, has been expected to do the trick.

In any great manufacturing concern the sales organization is supposed to take charge when, and only when, a high grade, salable commodity has been produced in the right quantities which careful surveys have ascertained that the market can absorb, and a product which when sold will be shipped to the consumer in such manner that it will arrive in salable condition. Added to this the article manufactured is christened with a branded name, and this brand means a certain known quality and on this quality its price is fixed. How has it been with potatoes? Has the exchange manager been able to say definitely what he is offering to the market?

The crepe hangers tell us that in this case co-operation has fallen down; but indeed it hasn't. There simply wasn't enough of it. Those who are working out the potato problem are convinced that co-operation is the answer. Not co-operative marketing alone, but co-operation between producer and producer that may grow the amount and quality that all may sell at a profit. Co-operation between grower and the local warehouse manager, that the product may be graded and stored in such manner that when called out by market demand there will be no come-back from the buyer to reflect back on the man who grew the potatoes. Co-operation between state exchanges so that when one exchange has its market demand established and the channels of trade open, a sister state will not pour in an avalanche of potatoes and, as was done only last season in Michigan by the states immediately west, and wreck the market.

Over-production

Mr. Hughes, Director of Markets, in stating the object of the meeting called attention to the fact that 62 per cent of the potatoes which rolled in interstate commerce are produced in the seven states represented in the conference. He had prepared charts which were hung where all could study them. Among these was a very illuminating table showing an increase in potato production in these states of 33 per cent in the last three years, with disasterous results. Here are the figures:

Acreage—Three Years

	1920	1921	1922
Mich.	345,000	340,000	357,000
Wis.	308,000	315,000	328,000
Minn.	319,000	430,000	486,000
N. D.	83,000	124,000	198,000
S. D.	75,000	90,000	110,000
Neb.	85,000	102,000	139,000
Mont.	40,000	41,000	46,000
Total, 7 states—	1,255,000	1,442,000	1,664,000

Yields—Three Years

	1920	1921	1922
Mich.	36,225,000	27,200,000	37,800.000
Wis.	33,200,000	21,400,000	40,600,000
Minn.	31,500,000	32,200,000	43,700,000
N. D.	6,500,000	11,900,000	17,800,000
S. D.	7,900,000	5,400,000	8,500,000
Neb.	8,400,000	8,100,000	11,600,000
Mont.	4,400,000	4,700,000	5,700,000
Total, 7 states—	128,000,000	111,000,000	165,000,000

The Director of Markets said: "Farmers agree that it is a bad year, next year will be a good year. And what I am afraid of is that next year again will see an increase in acreage and that we will be faced with a sec-

(Continued on Page 19)

DON'T PLUNGE IN POTATOES

REX E. WILLARD, North Dakota potato expert says: "Potatoes in a limited acreage are a profitable crop over a period of years but the man who jumps into potatoes in one year without the next, usually jumps in at the wrong time. The price of potatoes fluctuates up and down pretty consistently in alternate years in the opposite direction from the amount of production in the country. Our records indicates, however, that over the long time period potatoes are even more profitable, acre for acre, than some other cash crops.

Commercial Fertilizer Found to be Better than Manure for Sugar Beets

FEW crops give as large returns on expenditure for fertilizer as do sugar beets. Increases of from 1⅝ to 3 tons of beets are not uncommon for 400 pounds of fertilizer. The sugar beet demands a liberal supply of available plantfood, particularly, in the early stages of growth. It takes a certain amount of plantfood to start the plant and make the leaves. Any plantfood in excess of this amount goes into making larger beets, increased leaf surface and capacity to make sugar.

Fertilizer vs. Manure

Manure, while an excellent fertilizer for most crops, has some disadvantages for sugar beets as compared with commercial fertilizer. When used, manure should be well rotted, applied during the previous fall, and plowed under so as to decay. Spring applications of fresh manure may cause short prongy, low yielding beets, and in many cases it carries so many weed seeds that the labor necessary to care for the crop is greatly increased. Furthermore, the plantfood in manure is not so readily available as in fertilizers, and does not supply available plantfood so quickly early in the season. Frequently, manure produces an unduly large growth of leaves and root above ground. Altogether, the best place for manure is on the crops preceding beets, to build up the soil to the point where fertilizers can be used more profitably.

What Kind of Fertilizer

For most soils, the right kind of fertilizer should contain from two to four per cent ammonia or nitrogen, eight to twelve per cent of phosphoric acid, and two to six per cent of potash. The proportions of each of these fertilizer constituents will depend on the nature of your soil, and the farming practice you follow. In a system of dairy or livestock farming, where plenty of manure has been applied to the preceeding crops, it is not necessary to use much ammonia and potash in the fertilizer, especially on the heavier dark colored soils. On thin soils, a fertilizer fairly high in both ammonia and potash will be most profitable. Practically all soils in Michigan respond to a fertilizer high in phosphoric acid, we are advised by the Michigan Agricultural College. On sands and light sandy loams where legumes are grown in the rotation the 3-12-4, 2-12-6, and 4-8-6 analyses are recommended. On heavy sand loams, silt loams and clay loams, the choice of analyses may be confined to 2-12-6, 2-16-2, 0-12-6, and 3-12-4. Where a considerable amount of manure has been used previously in the rotation, the 0-16-0, 0-14-4, and 2-16-2 fertilizers are suggested. All of these fertilizers are what is known as high-analysis fertilizers, carrying the maximum amount of plantfood with the least amount of filler. Such fertilizers are more economical per pound of plantfood than the lower analyses sometimes offered.

How Much Fertilizer

Some growers use 800 pounds of fertilizer to the acre. It is not advisable to use less than 200 pounds except under special conditions. In the majority of cases from 400 to 600 pounds per acre will prove to be the most profitable amount to apply. A common error is to use too little fertilizer, or too low an analysis.

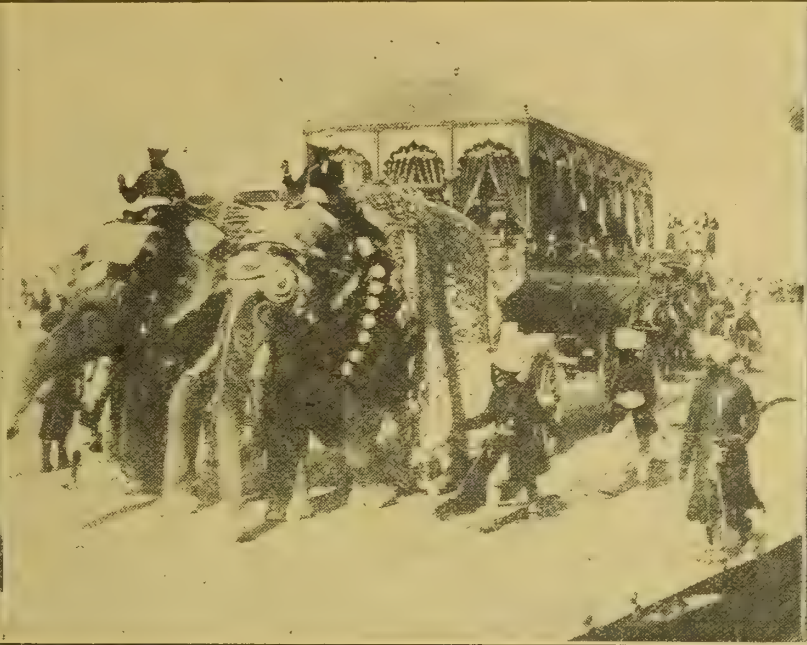
How to Apply

If the beet drill has a fertilizer attachment, a part of the fertilizer, not to exceed 200 per acre, may be applied at seeding time through this attachment. The remainder should be broadcasted by means of a fertilizer grain drill or a lime and fertilizer distributor, and harrowed or disked in before planting. When beet seed is sown with a grain drill, leaving every third hole open for the seed, all of the fertilizer holes may be left open. Some growers prefer to broadcast all of the fertilizer, which is a good practice when 600 or 800 pounds are used to the acre. Such an application should be made before seeding so that the fertilizer can be worked thoroughly into the soil.

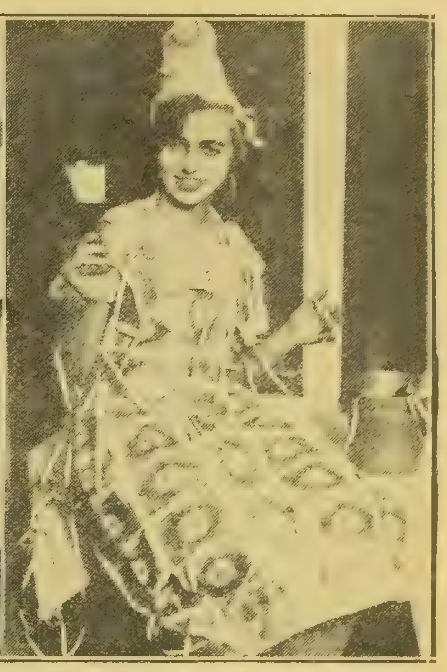
This Michigan field of sugar beets shows the value of fertilizing your sugar beets. Fertilizer was used on a part of the field and the remainder sown without fertilizer. The fertilized part is shown on the left.

PICTURES FROM FAR AND NEAR

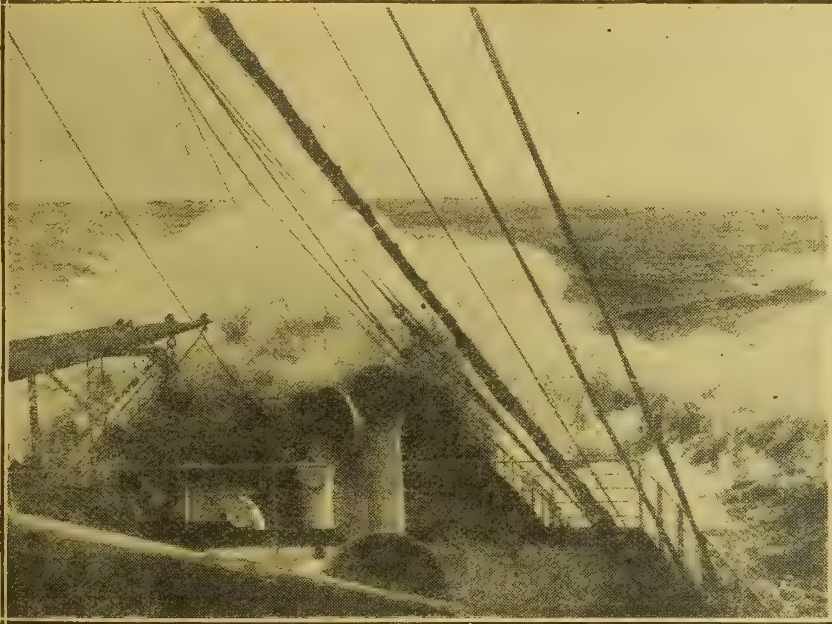
MRS. HENRY FORD, who was Clara Bryant, the daughter of a farmer who lived eight miles from the Ford farm near Dearborn, Michigan. Mr. Ford attributes a large measure of his success to his faithful helpmate and companion and she is carrying on as agressively as her husband many plans of social uplift and charity.



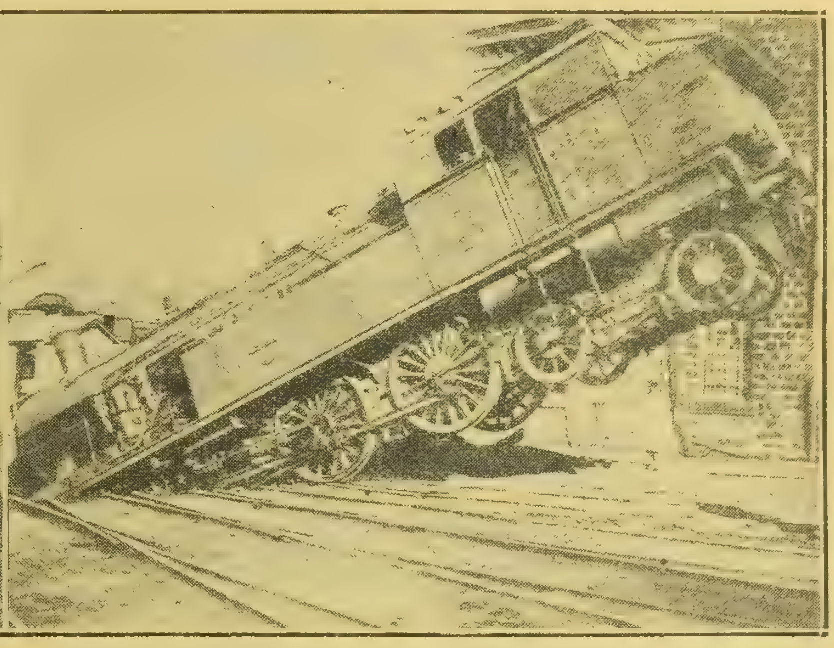
THE ROLLS ROYCE OF INDIA.—For real class, the elephant cars kept by the native Princes of India surpass anything in the world in the way of private equipages. The most magnificent trappings are used while artists are hired to decorate the tusks of the animals with carvings in precious metals and to paint extraordinary designs in glowing colors over the hides of the beasts. The upkeep of such a car would make the expense of keeping up a high powered automobile compare with the upkeep of a kiddie car. Photo shows such a car being conducted through the streets on a native holiday.



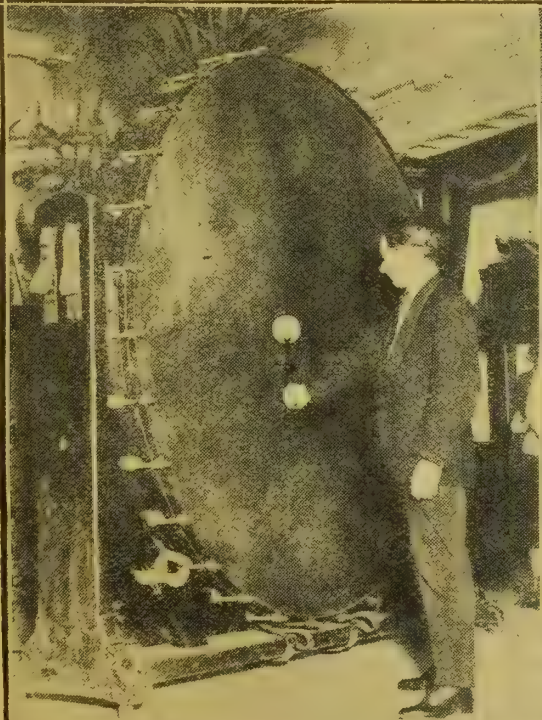
"MARK" THIS COSTUME.—On the continent the mark doesn't mean a thing, and it is being used instead of paper to cover walls, wrap up commodities, etc. Here is an original costume, taken at a masquerade in Amsterdam, Holland. The Dutch girl is covered with 100 and 1000 marks.



"THE BREAKING WAVES DASHED HIGH."—Passengers and crew on the steamship Homeric declared that she had passed through what was the worst seas of her career during her last trans-Atlantic trip. Many never expected to see land again. Here is a view of the ship driving through an 80 mile gale with the waves actually mountain high.



SABOTAGE IN THE RUHR.—Incensed by the French invasion, the Germans are committing many acts of sabotage. Here is what happened in one of the railroad yards, in the occupied Ruhr territory. The train was derailed and it was many hours before order was restored. The French are finding it difficult to punish the culprits.



BIGGEST DRUM IN THE WORLD.—What is said to be the biggest drum in the world, is this one, discovered in a London movie theatre. It is 8½ feet in diameter, and was made by Henry Giston many years ago. The hide comes from an enormous prize bull featured in a Cattle Show.

A VICTIM OF "BLIND" JUSTICE.—Leroy McKinney of Cincinnati, Ohio, was the victim of miscarried justice. He was sent to the Ohio penitentiary for life as the slayer of a policeman and had served five months when the perpetrator of the crime confessed.

THOUSANDS FLOCK TO LUXOR.—The discovery of King Tutankhamen's tomb, in the ruins of Luxor, Egypt, has converted the desolate ravine into a veritable mecca for tourists, historians and archaeological students, who come streaming here from all parts of the world

TWO HUNDRED AND SEVENTY-GALLON SEPTIC TANK AND DISPOSAL LINE—SUITABLE FOR THE AVERAGE HOME

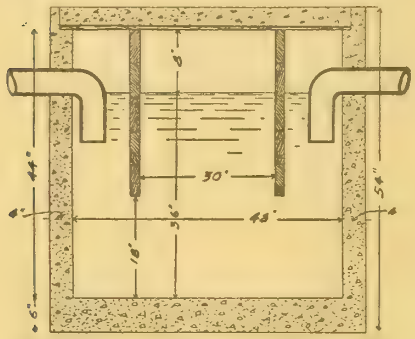
Build a Septic Tank to Dispose of Sewerage

Complete Directions on Constructing Tank that Meets Demand of Average Farm Home

NEARLY five years ago I built a septic tank, similar and no larger than the one here described to care for the sewage from a toilet, bath-tub, wash-stand and kitchen sink at my home. From that day to this it has cared for every particle of sewage from our family. Has never frozen up, filled up or otherwise given a moment's trouble of any kind. The outside privy ought to be one of the first things abandoned on any farm, there is no greater human convenience than an inside toilet and bath-room and none that will contribute so much to keeping your young folks on the farm.—Editor.

THERE is much evidence to show that a tight, well-built, underground septic tank, so called, with shallow distribution of the effluent in porous soil, generally is the safest and least troublesome method of treating sewage upon the farm, while at the same time more or less of the irrigating and manurial value of the sewage is realized.

The antecedents of the septic tank were known in Europe more than 50 years ago. Between 1876 and 1893 a number of closed tanks with submerged inlet and outlet, and all embodying the principle of storage of sewage and liquefaction of the solids, were build in Massachusetts, New Jersey, Maryland, and Canada. In the past 20 years great advance has been made, and many plants, large and small, have been built. Much remains to be learned, but it is now certain that many of the early claims for the septic process were extravagant. There is nothing magical about a septic tank, and citizens should not trust implicitly in the name. The liquid escaping from a septic tank is assuredly not "spring water," nor is it harmless. It may contain, since the process involves intensive growths, even more bacteria than the raw sewage. As to the effects upon the growth and virulence of disease germs, little is known definitely. If disease germs be present, many of their number, along with other bacteria, may pass through with the flow or may be enmeshed in the settling solids and there survive a long time. Hence, so far as the danger of transmitting disease is concerned, spetic sewage is not improved materially over crude sewage, and the farmer should safeguard wells and springs from the seepage or the discharges from a septic tank with no less certainty than from that of liquefying closets and cesspools.



VERTICAL SECTION OF SEPTIC TANK

In all sewage tanks a considerable portion of the solid matter, especially if the sewage contains much greese, float on the liquid as a scum, the heavier solids settle to form sludge, while other finely divided solids and matter in a state of emulsion neither float nor subbside. If the sludge is held in the bottom of the tank to be converted into liquids and gasses, virtually to rot, the tank is called a septic tank and the process is known as septicization. Just how far this process may be carried to obtain the maximum sanitary benefit with the least nuisance and cost is still open to question. As preciously stated, spetic sewage implies offensive putrefaction. Not only is this objectionable as to odors, but numerous examples indicate that sewage reduced to the septic condition, or even highly staled, is less effectively purified, whether subjected to artificial filtration or to the natural filtration of the soil, then is moderately stale sewage. Aeration of a septic effluent seems to aid in its purification, but aeration lowers the temperature of the sewage and may result in the spread of objectionable odors or disease.

From what has preceded it is seen that the septic tank is not a complete method of sewage treatment. With the general run of small septic tanks, it probably is close to the facts to say that of all the solid matter in the crude sewage one-third is reduced to liquids and gas, one-third remains in the tank and one-third escapes with the effluent.

The tank shown herewith is easy to build and meets the demands of the average home. It has a capacity of 270 gallons, sufficient for not more than 6 or 8 persons.

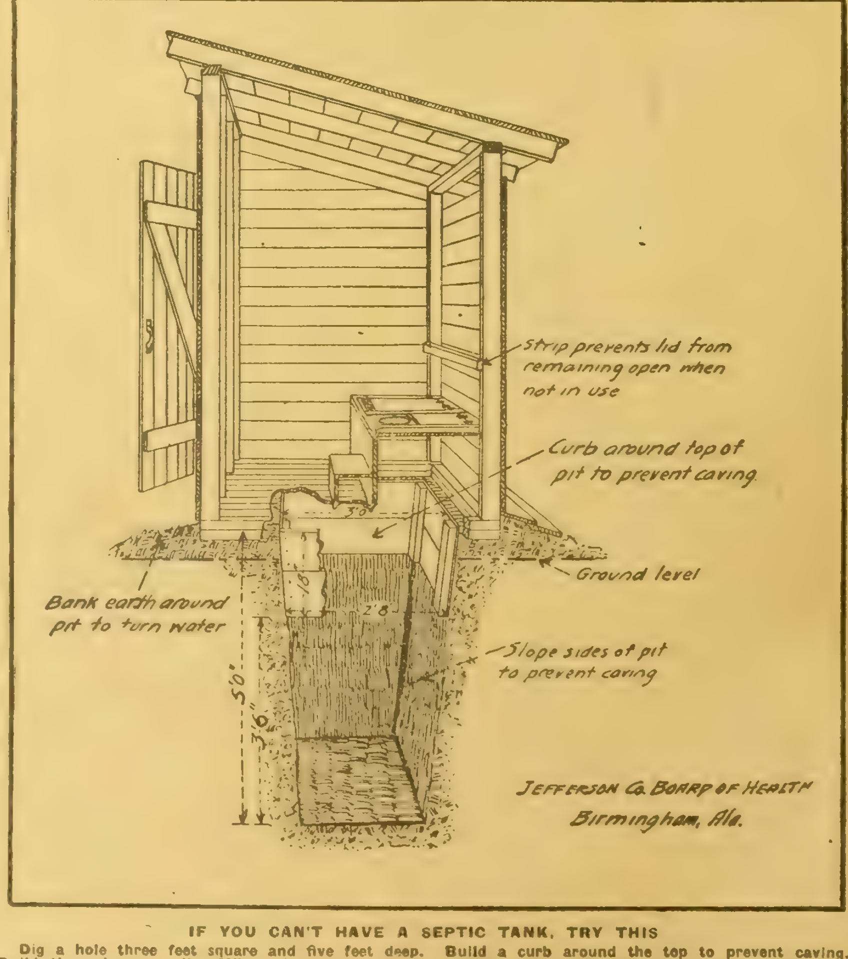
The construction of this tank falls under four heads as follows: Digging the hole; building and placing the forms; pouring and finishing the tank; constructing the disposal field.

Select a place for the tank. This may be as near the house as desired but care should be taken so that the tile line does not run into a hillside, necessitating extra digging to reach grade. Dig a hole 44 inches wide and 56 inches long, making the sides straight and square, the hole must be 42 inches deep below the level of the sewer from the house. If the depth of the sewer is not known, make the hole 54 inches deep and then lay the house sewer to agree. If the hole is dug true and clean, the forms will fit into them nicely.

The number and dimensions of the pieces required for making the form are shown on the drawing of the form. Cut these pieces and put them together as indicated. The pieces marked "H" must be fastened in by toe-nailing, and by inside cleats. With the form put together as shown in the drawing, nail or bolt two pieces of 2x4 timbers across the top to aid in handiing. The form is now ready to place in the hole.

By means of the 2x4 timbers the form can be placed as desired, centered carefully and held at the right heighth, which allows a clearance of 6 inches between the bottom of the form and the bottom of the hole. Put interior braces in the form—pieces of board a little longer than the inside of the form will do—to prevent the weight of the concrete from caving in the form. Level the form, and be sure that it is firmly in place.

The material required for the concrete work includes 9 sacks of cement, half a yard of sand, and a yard of broken stone, slag or gravel. Mix the concrete about 1:2:4—not leaner than 1:2½:5. Mix the first few batches a little stiff and use these for the bottom of the tank. If the mixture is not too wet, the sides can be poured without waiting for the bottom to be set, thus saving time.



Strip prevents lid from remaining open when not in use
Curb around top of pit to prevent caving

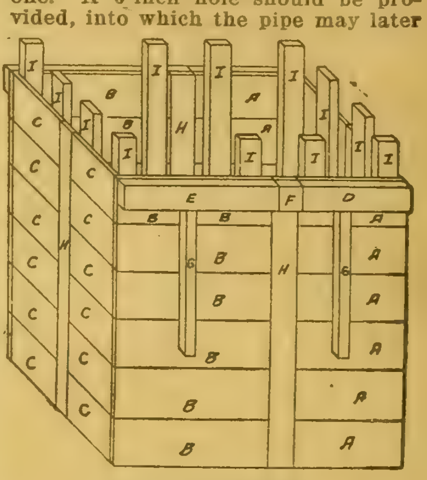
Jefferson Co. Board of Health
Birmingham, Ala.

IF YOU CAN'T HAVE A SEPTIC TANK, TRY THIS

Dig a hole three feet square and five feet deep. Build a curb around the top to prevent caving. Build the privy over it. When the hole is filled to within about 18 inches of the top, move the house to a new pit and cover the old one with soil. Moving will have to be done only about once in three or four years.

The inlet and outlet pipes can be placed in the form, or wooden boxes can be used to form holes through which the pipe can later be led. The later method is usually the easiest one. A 6-inch hole should be provided, into which the pipe may later be concreted. Place elbows at both inlet and cutlet, as shown in the drawing.



FORMS ASSEMBLED

THE FOLLOWING PIECES ARE REQUIRED FOR CONSTRUCTING FORM

Piece	No.	Diameter	Piece	No.	Diameter
A	12	1x8x18 in.	F	2	1x4x 4 in.
B	12	1x8x26 in.	G	4	2x4x24 in.
C	24	1x8x15 in.	H	4	1x4x48 in.
D	2	2x4x18 in.	I	12	2x4x54 in.
E	2	2x4x26 in.			

MATERIAL FOR MAKING TANK

9 Sacks cement.
½ Yard sand.
1 Yard broken stone or gravel.

Let the forms remain until the concrete has set for 36 or 48 hours. In taking down the forms, remove the pieces marked "H" first, after which the main portion will slip out easily. Place the wooden baffles in the groves provided for them, set the elbows firmly, and place the wooden floor for the cover. A shoulder is provided along the top for the purpose of supporting this. Make the concrete cover 5 or 6 inches thick. It is well to construct a manhole in the cover, and to use some reinforcing.

While the concrete is setting, the trench for the line may be dug. This should be at least 100 feet in length, but need not be in a straight line. Methods of bracing are shown for use where straight-away space is not available. Dig the trench 12 inches wide and 10 inches deeper than the outlet of the tank. Fill the trench to the level of the outlet witn broken stone, slag, gravel, or cinder, and on this porouus bed lay the tile, carefully and to line, with a fall of about 4 inches to the hundred feet. The best tile for the purpose, as well as the cheapest, is the unglazed farmer tile, without bells. One hundred feet will be required. About 3 or 4 yards of gravel, broken stone, slag, or cinder will be needed for the trench filling.

After the tile is laid carefully to grade, protect each joint from wash by placing over it a cover of burlap, roofing paper, tile or similar material, as shown. Then cover with 3 or 4 inches additional of gravel or slag, and fill the remained of the trench with earth.

The outfit is now completed, and will start to work as soon as sewage is discharged into it. No chemicals or other means for starting action are needed.

If properly and carefully built, there should be no trouble for many years. 8 or 10 years the tile disposal line may clog and require relaying. The tank needs an occasional cleaning out, possibly once in 3 to 5 years.

Farmers Service Bureau

(A Clearing Department for farmers' every day troubles. Prompt, careful attention given to all complaints or requests for information addressed to this department. We are here to serve you. All inquiries must be accompanied by full name and address. Name not used if so requested.)

CAN NOT HOLD SILAGE

I filled a silo for a party last fall and said party has not paid for filling yet. He put me off and then he had a sale and sold everything off. He promised to settle with me after the sale, but he still keeps putting me off. Knowing he was in hard shape, I didn't like to push him, but would like to settle now, and he doesn't seem to be in a hurry. Would like to know whether the ensilage in the silo still stands good for the pay of cutting and filling. How would I have to go about it to get it?—V. C., Whittemore, Mich.

—I am of the opinion you would not have a lien on the ensilage for your labor, but would have an adequate remedy in an action at law for the amount due on your contract of labor. I would sue and get judgment and levy an execution on the ensilage.—Asst. Legal Editor.

MAKING VINEGAR FROM SOURED HONEY

Would like to hear from some one if soured honey could be made into vinegar and if so how made?—L. V., Riggsville, Mich.

—Soured honey may be utilized for vinegar, provided that the acidity does not exceed one and one-half percent after the honey is diluted. A very good formula for making honey vinegar is forty to forty-five pounds of strained honey, thirty gallons of water (preferably soft), ammonium chloride four ounces, potassium carbonate and sodium phosphate two ounces each. The chemicals should be dissolved in water and added to the honey. This will assure their complete solution.

The above chemicals are added to the honey stock because the honey after dilution is poor in nitrogen and phosphorus and these are necessary foods for the vinegar-making microorganisms. Heat should be used to facilitate the dilution of the honey and also to destroy the undesirable germs which the soured honey probably contains.

After being diluted according to the above formula it should weight not less than nine pounds per gallon in order to contain sufficient sugar. From twelve to fifteen percent sugar should be present. Diluted honey prepared in the above manner will then have to be inoculated with vinegar yeast, as the heat used in dissolving the honey also destroys the desirable germs. Pure cultures of yeast selected for its ability to produce high percentages of alcohol from sugar may be secured from the Bacteriological Laboratory, East Lansing, Michigan, as may also the chemical salts. The price of the chemicals and the vinegar yeast is twenty-five cents each for one-barrel amounts.

Following the alcoholic fermentation produced by the yeast it will be necessary to add a vinegar bacteria culture which is for the purpose of changing the alcohol into acetic acid of vinegar and which the state law requires to be four percent before it is marketable. This vinegar bacteria culture may also be obtained from the Bacteriological Laboratory, East Lansing, Michigan, and at the same price as the vinegar yeast. —R. L. Tweed, Res. Asst. in Bacteriology, M. A. C.

ASSESSED TOO HIGH

When personal property is assessed for two hundred dollars more than he would sell it for, or what he thinks is the real value of it, and he refused to pay taxes for that amount and it is sold, don't they have to allow a man at least what it is assessed for, or can the assessor value your property anything he wants to, and you have to pay it or have it sold for whatever it brings, or just enough to pay the tax for that year? Also how is real estate that is over-valued? All of our taxes are assessed from one to four hundred more than we think they are worth or what we would sell them at.—H. A., Doster, Michigan.

—If any person fails to pay the taxes on his property and it is sold for taxes, the defaulting taxpayer will receive, upon sale, whatever the property actually brings, after deducting the amount of the delinquent taxes. He may redeem the property so sold at any time prior to the first Tuesday in May following the sale, upon payment of the amount of the sale, with interest at 1 percent per month. Property should be assessed at its actual cash value, and when any taxpayer feels that his property is over-assessed, he should make complaint to the board of review of his township, to have such assessment adjusted.—Asst. Legal Editor.

HAS WILL BEEN PROBATED?

Will you please let me know if heirship property can be outlawed or barred when there is a good title and also a will left to heirs and their heirs for ever and ever? Please let me hear from you. The property is in New York City. I have a large sum of money that was left me years ago.—Mrs. R. B., Beaverton, Mich.

—If money or other personal property was bequeathed to you by a valid will and the will duly probated, I am of the opinion you have a good title to the property. However, if the will has not been probated and more than 4 years have elapsed since testor's death, you may have lost your right to the property by its having been sold to a bona fide purchaser after the lapse of 4 years. Title to real property may be barred by adverse possession.—Asst. Legal Editor.

MORE INFORMATION NEEDED

A farmer wishes me to help him farm on shares this summer but he does not know what share I should get. He has his hay planted and has about 20 acres and it is all good hay; has wheat planted, but the potatoes, oats and bean land has not had anything done to it. He has enough barn yard manure to spread it. Now the machinery and team all belong to him. All I do is to go in and help him and he is to work the same as I do. He has eight cows to milk and sells his cream. What share should I get from all these different things? Should I get a share of the calves and pigs or any other increase in live stock?—H. H., Boyne Falls, Mich.

—Sufficient data is not given to figure definately what share of the farm income should go to you for your work? If it is possible to estimate the income from the various sources and knowing what you can afford to work for it would be an easy matter to determine what portion you should have.—F. T. Riddell, Dept. of Farm Management, M. A. C.

ENTITLED TO ONE HALF OF ESTATE

At the death of the husband several years ago no will was left, and only one child. There was some indebtedness on the farm, but widow and child have remained on farm, paid the indebtedness, everything is clear from debt. The widow has lived there continuously for 46 years. What share is the widow entitled to? —Mrs. S., Branch County, Mich.

—Upon the death of the husband without having made a will and leaving a widow and one child, the widow and child would each be entitled to one half of the estate, according to the satutes relative to descent and distribution.—Asst. Legal Editor.

CAN RECOVER DAMAGE

I am writing to you for a little information. I bought a cow registered and she was to have a calf in the spring, and she never had it or come around, and we went and seen the man I bought her of, and he made me an offer. I was to give $25.00 more and receive another cow. She was to come fresh inside of four weeks. I asked him if he thought it would hurt her to move her, and he said it would not hurt her, but he did not move her for 12 days after the bargain was made, and he put her in a truck and tied her, and she was sick when she was delivered. The cow was sick before she got to

The Truth About Henry Ford

By Sarah T. Bushnell

The Ford Factory, Foundry and Trade School—His Americanism

(Copyright by Reilly & Lee Co.)

CHAPTER XI

The Ford Factory, Foundry and Trade School

WHEN the first Ford factory outgrew the Piquette street plant, the larger plant in Highland Park was built. This is really a great industrial city in itself. It covers one hundred and twenty acres and employs fifty-three thousand men. Each employee receives his wages twice a month; yet every day is a pay day in some section of the plant and a half million dollars is handed the men.

In the Ford organization are men doing every conceivable kind of work. The factory operates its own power, heating and lighting plant, fire department, telephone and telegraph exchange, freight and express offices, hospital, safety and hygiene departments, motion picture studio, park and athletic field, band and auditorium, educational and legal departments, grocery, drug and shoe stores, meat market, tailor shop, and publishes its own newspaper—the Ford News.

The Ford fire alarm system is said to be more efficient and up-to-date than any other in the country, even including the cities of New York and Chicago. Ninety experienced fire fighters are employed in the plant and two hundred trained workmen are ready to aid at an instant's notice. When a general alarm is sounded the automatic call goes instantly to the Superintendent's office, factory service office, fire department headquarters and Chief Engineer's office. The minute, hour, day, month, year and box from which the call comes are thus recorded. Three hundred call stations are placed throughout the factory two hundred feet apart.

The medical department is wonderful and is one of the most modern institutions of its kind in the world. This is entirely separate and distinct from the Henry Ford Hospital, built at a cost of three million dollars and rented to the government during and after the war for one dollar a year. Mr. Ford calls this his garage. "It is my shop," he says, "where I hope people can get well as rapidly as possible and have their injured parts repaired." A pretty bit of sentiment is connected with the tall elms that reach to the fifth story of this building. They were moved from his Dearborn estate and replanted so that the new part of the hospital, which is the same length as the National Capitol, is surrounded by old trees that once had their roots in the soil of his boyhood home. This hospital was not built to serve the very poor, for whom free clinics are provided, nor to serve the very rich, who can afford to pay large surgical fees; but is for those of us who find it difficult to make ends meet and to whom heavy hospital bills are a calamity.

The moving picture laboratory, in in the Highland Park plant, is remarkable. Its educational pictures are shown in seventy per cent of our country's theaters. It may not be known that these are sent to Mexico, Brazil, Chile, Argentina, South Africa, Spain, Sweden, Norway, Japan, China, Alaska and other countries. Mr. Ford desires that they be used in the large and small schools, wherever they can be of service or can give pleasure. Therefore, the rental price to schools is fifty cents a day per reel. The movie staff includes many of the best-known specialists in educational lines, under whose guidance are editors, scenario writers and directors. They strive to produce films of value to teachers throughout the land, to be used for instructing their pupils.

The Ford educational department, its wefare work and Americanization school have been treated at length elsewhere. The Ford trade school is in a large wing of the plant which serves as a school building. It is incorporated under the Michigan laws and extends to a limited number the opportunity to continue their academic education while learning a trade. It is one of the best plans for salvaging some of our destitute boys, or boys who have no one to care if they succeed or fail. Mr. Ford is not willing for them to be called destitute; he prefers to think of them as boys without friends. For several years he maintained a home for homeless boys near his estate. This required such a large amount of his time and interest that he planned the trade school. Each student receives a scholarship which amounts to four hundreds dollars annually, divided into semi-monthly portions. This enables him to be self-supporting while studying. His scholarship is increased in accordance with his ability and effort until it reaches nine hundred dollars. To develop thrift one dollar is added to each pay envelope, provided the boy keeps a savings account. There are fifteen instructors employed; a board of five members directs the policy of the school, and a long waiting list is kept of boys who wish to be admitted. Mr. Searles, the head of the school, is a distinguished educator.

Mr. Ford realizes that the future of our country depends on the boys and girls of today. He gives to those he befriends his money, his time and thought, and to each an opportunity to achieve success. They will be the men and women of tomorrow, and it is his hope that they become good and honorable citizens.

Some idea of the gigantic size of the Ford organization may be secured from the fact that besides the Highland Park plant, the tractor plant is located at the River Rouge foundry where twenty-one railroad tracks enter. Here at one point a log goes in and at another point comes out a finished body. There are thirty-one assembling plants in this country and others in different parts of North and South America, Europe, Australia and the Orient. During the last year nearly one hundred thousand freight cars were needed to handle Ford shipments. Every available method of transportation was used also, such as express companies, parcel post and motor truck.

With a total of sixty-six thousand employees in the Highland Park, River Rouge and Dearborn plants, it is a conservative estimate to say that one-fourth of the men, women and children in Detroit and its environs are directly dependent on the Ford industries for support, and that an equal number are indirectly supported from this source.

It is said that man's efficiency has been increased 66 per cent by the automobile; families and friends have been drawn closer together; health has improved; lives have been prolonged. It has given more service and pleasure than any other invention in the last several decades. The inventor who built a car within the reach of the mass of the people has been a benefactor to his fellow man, and has helped make history.

* * * *

For sentimental reasons the handmade bricks that were in the foundation of Ten Eyck's tavern are part of the hugh fireplace in the trophy room, on the lower floor of the Ford mansion. The great iron horse storms through Wayne County at a more rapid rate as it parallels the Michigan highway toward Chicago. The forests have been cleared .There are no more Indians about. For many years the Dearborn arsenal has not been used as an army post, but the thick, gray stockade walls still stand. One of the square, gray buildings flanked by twin chimneys is the City Hall, where William Ford acts as Mayor. The old site of Ten Eyck's tavern is interesting to people who flash by in their motors, because it is the entrance to Henry Ford's estate. The gray-stone entrance is kept locked and guarded; it is adjacent to the gatekeeper's tiny gray-stone cottage, tucked quaintly under its Indian red-tiled roof; around it sturdy forests look down on the spot which William Cremer won his wager that he could beat the iron horse into Dearbornville, just two miles away.

CHAPTER XII

His "Honest-to-Goodness Americanism"

Five years ago a rainbow of promise, with a bag of gold at each end, hung over a great industrial plant. When the rainbow appeared some called it a menace, but it grew brighter and clearer; some of the colors became obscure; three came out stronger than all the others, and behind them stars formed the two words, "Americans all." At each end of the rainbow the bags emptied an endless stream of gold, and with the gold came freedom from old industrial conditions and with the freedom came the privileges and obligations of American citizenship.

Henry Ford made automobiles to defray the expense of his main business, which was the making of men. He took wise men and good men, successful and unsuccessful. He took Americans of good old colonial stock and laborers from every nook and corner of obscure foreign lands. He took men with the stigma of wrong-doing upon their lives. He took untried men and men who had tried and failed. Through one great system he put them all, to determine the number who would come out pure gold. He thrust aside labor organizations and paid his workers wages at that time considered fabulous. He had his own dreams and he followed them to fulfillment.

Beyond a few brief newspaper reports, the light of publicity never disclosed the inner workings of Henry Ford's mind, yet the spirit of it permeates the country from Canada to the Gulf and from the Atlantic to the Pacific where other plants have used the Ford idea on a smaller scale. The pioneer who began the movement has been assailed and held up for ridicule, yet he was the first advocate of simonpure Americanism in industry. What would his critics have said had they known that he took the dean of a great cathedral, made him head of a vast educational system and gave him power no clergyman ever before had had in the history of business—entire authority over the living conditions of the Ford workman and real influence in the case of labor difficulties? Labor difficulties, however, refused to arise. During strikes at nearby plants the Ford workers remained at their posts, performing their labors in contented prosperity.

Henry Ford had evolved a system so unique and remarkable that his plans and dreams blend, making a practical whole which has actually benefited over fifty thousand homes. The foundation is education and Americanism. That the system has paid commercially is only a side issue, but one of tremendous importance—marking the ideal adjustment of capital and labor, and proving beyond doubt that the experiment is overwhelmingly correct. The assistants in this departmen are called advisors, and the welfare work they are doing is as helpful as it is novel. What they do and how they do it will be explained later.

Mr. Ford states his position frankly. "If I can make men of my employees, I need have no fear for my business," he says. "Everything I do to help them ultimately benefits me; the more money I spend on them, the more enthusiasm they will have for my interests and the more money they will make for themselves and for me."

And he uses all possible labor-saving devices, for he says: "The less fatigued a men is when he leaves his work the more self-improvement can he gain during leisure hours." This is the message of Henry Ford to mankind: "Be your brother's helper." In his plant Bolshevism has not dared to rear its serpent head.

The Ford plan is not to build elaborate libraries, gymnasiums or lunch rooms for the employees, but serviceable and substantial ones. The difference in the expense is given the working men for their homes, their living and their families. It is not the possession of money but the right use of it which is emphasized. Mr. Ford holds that the system of education which increases, through the so-called cultural studies, the capacity for happiness and fails to develop the financial power for gaining the same is a cruel, not a kindly system. It increases human misery and failure. The Ford idea, while increasing a man's capacity for happiness, at the same time increases his efficiency, his earning capacity, his home conditions, his knowledge of the laws of the state and the nation, making him a more valuable citizen, more worthwhile to society, giving him a broader vison, all of which develops a man's mind while training his hands.

The factory has two slogans: "Be a Good American," and "Help the Other Fellow." You find these signs in the working sections of the plant. The workmen are taught self-application of these slogans, even beneficially coerced into adapting them as life standards.

(Continued in April 14th issue)

HENRY FORD'S SUCCESS RULES

FEAR is the great canker that eats at the hearts of men. Most men are entirely too confident of their ability to fail—and they fail. If they were as confident of their ability to succeed, most of them would succeed.

* * * * *

What the world needs is more faith. We haven't half enough of it. We are always saying "I can't," when we should be saying, "I'll try and I'll never stop until I succeed."

* * * * *

The idea of human beings in a hurry always seemed a little absurd to me. Haste is a great maker of discouragement. It was nearly twelve years from the time that I built my first car before I put one on the market.

* * * * *

It is work done against the will that wears. Or work done merely for wages. Wages are necessary, of course, but mere wages are not enough to keep body awake or prevent him from becoming weary.

* * * * *

Nobody who is willing to get money legitimately need think about money. It is only the people who want to get money without earning it who need think about it.

* * * * *

Right now there are thousands of opportunities to make fortunes. People don't see them; that is all. Let anybody who wants money to come to him take the simplest useful thing he can think of; let him study it, improve it and refine it until it is better than anybody ever made it before. Then let him manufacture it on a big scale and money will come to him.

* * * * *

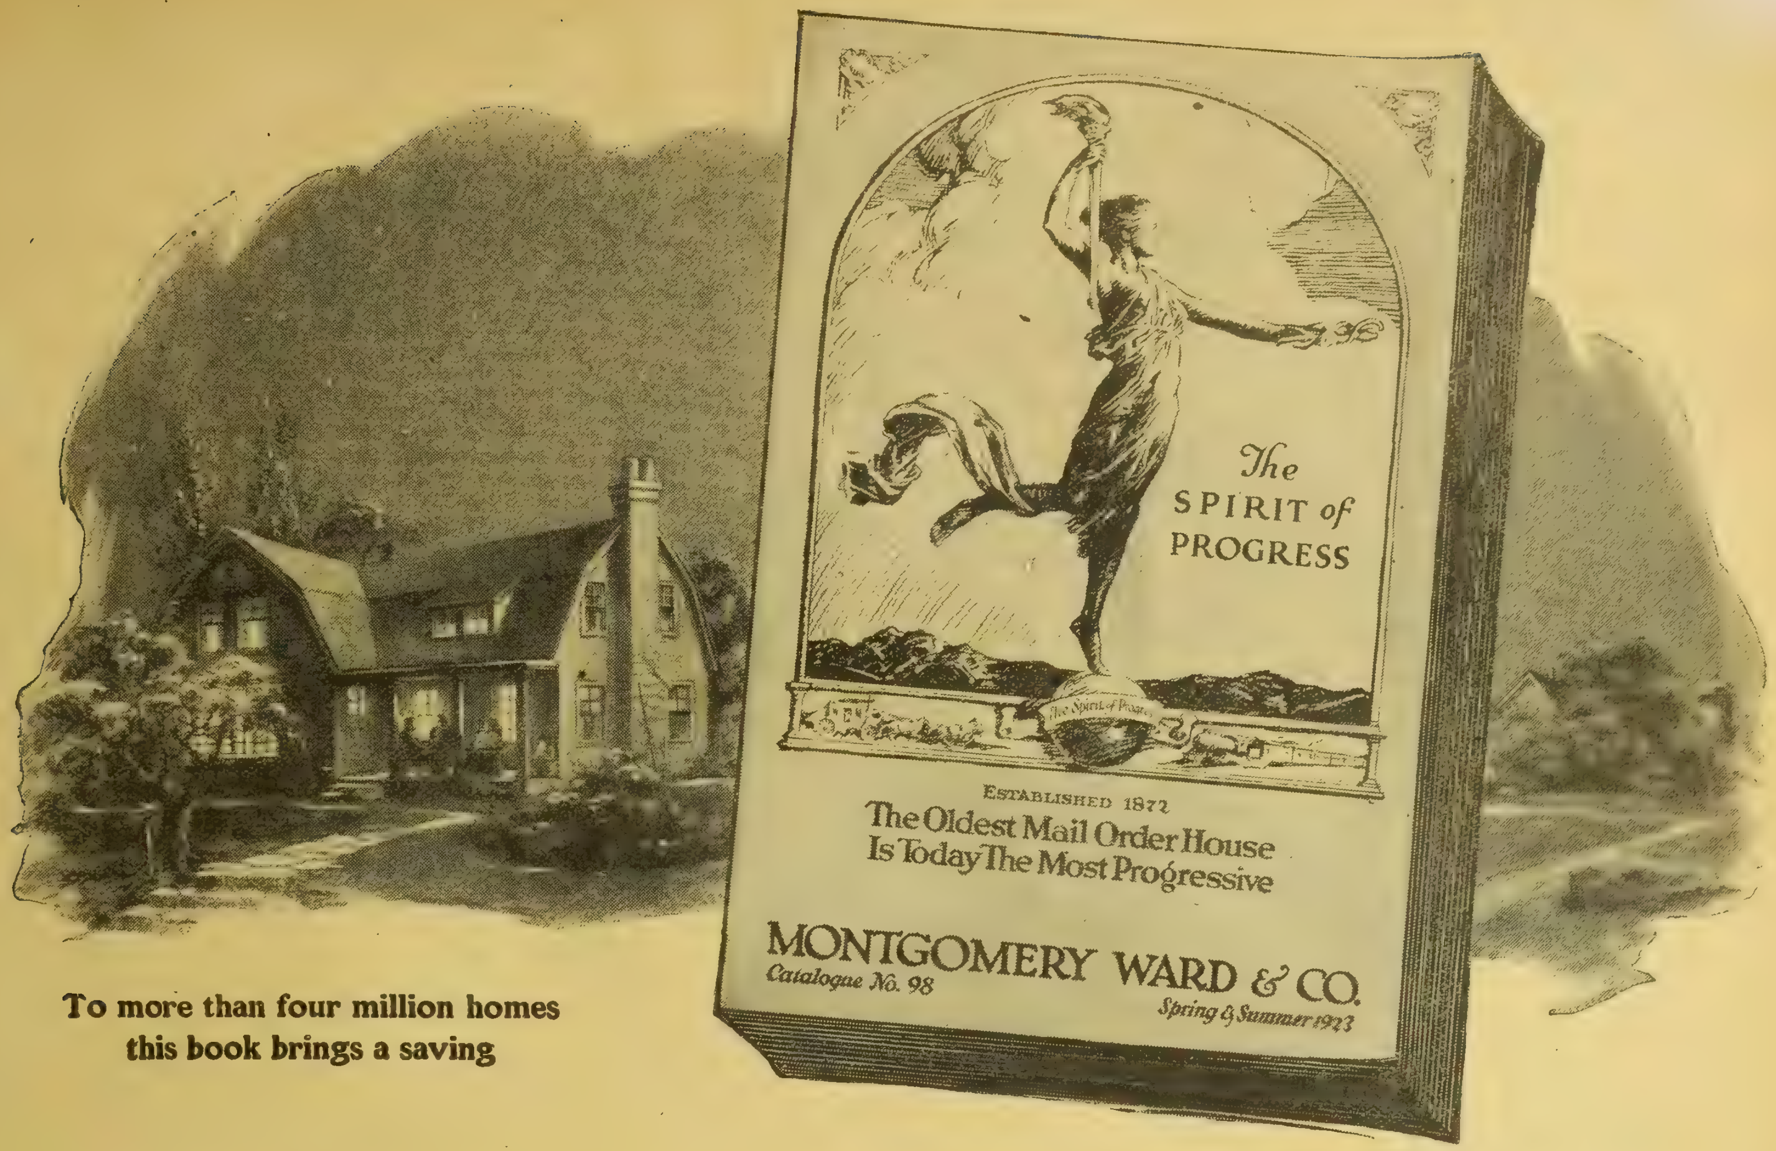
Money mixes with nothing that is worth doing. The right way to get money, therefore, is not to try to get it. Money, when it comes, should come as an incident to something else—as the result of doing something useful.

* * * * *

One of the reasons why American business men, as a class, are not as efficient as they might be is because they think first of profits and next of service.

* * * * *

If American manufacturers and business men generally would, for a period of five years, cease thinking of profits and devote all of their energies to giving the greatest values and the best possible service to the public, they would make more money and they would revolutionize American business.



To more than four million homes this book brings a saving

This book is saving millions of dollars for the American people

Are you using this Book? Is it saving money for *you and your family?*

Are you taking full advantage of the opportunity for saving it brings into your home?

Do you consult this Book—this price guide — *every week* to find the lowest price for everything you buy?

It will save you many dollars on your needs, on your family's needs, if you *use* it. It will give you the lowest price on goods of standard quality—*always.*

Millions Buy from this Book on Faith in the Name Montgomery Ward

For Fifty Years, Montgomery Ward has been selling only goods of Standard, Serviceable quality. The American people have learned by fifty years' experience that they can trust Ward's and that Ward's prices are as low as *absolutely reliable goods can be bought.*

For Fifty Years, we have kept faith with the public. We never sacrifice quality to make a *seemingly* low price. We make no price baits by offering goods of inferior quality. We quote the lowest possible prices—but always on the kind of merchandise that stands *examination* and *use.*

Buy From this Book—Use it Every Week

This Book is of value to you only if you get the habit of using it every week.

It will save you money *only if you use it.* And, then it will bring into your home a great satisfaction and a large saving.

It will bring you the advantage of always getting dependable goods. It will insure your getting prompt, courteous service. It will insure your always buying at the lowest price.

Montgomery Ward & Co. is the oldest mail order house—the originator of selling goods by mail. Yet, never in our Fifty Years' history has this organization been so capable of serving you well, so filled with the spirit of youth, of progress and so alert to give you satisfactory service and lower and lower prices.

Buy from this Book. Fill all your needs from this Book—everything for the Family, the Home and the Farm. Consult it daily to find the right price, the lowest price for dependable goods of standard quality.

FRUIT AND ORCHARD

Edited by FRANK D. WELLS

CALLUS GRAPE CUTTINGS

How can I callus grape cuttings? The bulletins say that they should be callused, but do not say how it is done.—R. M. Saginaw County.

—The callus is the formation on the wound at the end of the cutting. Place cuttings of grape, currant, gooseberry, or any of the plants that take root readily, in moist sand and keep in a cool place. If done when the plant is dormant the callus will soon form. The sand should be kept moist, but not wet, until the weather is warm enough for planting out.

BEST GRAPE FOR MICHIGAN

What is the most profitable grape for Michigan? What is the right distance for planting? Does the grape bear on the new or the year-old wood?—E. T. C., Oakland County.

—The Concord is by far the most important variety of grape for Michigan. All other varieties combined come far short of the Concord. In the Grape Belt there are a few Morris Early, for the first of the market, a few Niagara and three or four others, but they are unimportant. The general market takes the Concord and so do the juice factories. The variety is hardy, productive and a good shipper, a combination suited to the commercial vineyard. For home use Niagara for a white grape and Brighton for an amber might be added to Morris, and Concord. For a special market they have been found desirable. But in general there is nothing to take the place of the Concord. Some years ago the Worden was introduced as an improvement which was to supercede the old favorite. It has much in its favor, but the berries come off the stems too easily. Grape vines are planted about 12 feet apart in the row, and the rows far enough apart to admit cultivation, about 8 feet. The wood which grew last year will produce the fruit next summer.

GRAFTING GRAPES

Can grape vines be grafted, and if so how is it done? Are seedling grapes like the parent?—H. G. C., Livingston County.

—Grapes can be grafted, though that is not often done, since a vine can be grown so easily and quickly from a cutting. As the vine is flexible the graft is put in the root. Dig down four or five inches below the surface, cut off the root and make a cleft graft. Cover with wax, clay, or some material to protect from moisture. Grafting may be of little commercial value, but it may occasionally be of service. A wild vine could soon be made profitable, as a strong root system would force a graft into a vigorous growth. Seedling grapes cannot be depended upon to be like the parent. Like the orchard fruits they produce new varieties. Many kinds have been produced by hybridging or the crossing of two varieties, but few of them have been of any value.

NOTES AND COMMENTS

The questions asked regarding grape culture indicate the interest taken in this fruit. The planting this spring promises to be unusually large, but as the demand has increased enormously during the last few years there seems little danger of over production for several years to come.

While the Concord is the most important variety, both for the commercial plants and for home use, there are other varieties that merit consideration. The Cotowaba requires too long a season for Michigan, but the Deleware, Brighton, Ogawan, Niagara, Morris Deamond, Green Mountain and Salem have many friends. Will it not be well for grape growers to plant a greater variety than they have in the past? An orchardist is not content with one peach, even the Alberta, or with one apple, even the Jonathan. Why be satisfied with one or two grapes, even Morris Early and Concord?

* * *

One of the needs of the hour is a sweet cherry suited to Southern Michigan. This is not saying that the sweet cherry will not grow in this part of the state, but is is difficult to get started. The trees have the bad habit of dying the first season, or if they live through that year they try it the next summer. Then there is sun scald and other ills to which the tree is heir, all of which is discouraging to the fruit grower. So to plant some other tree, here is an opportunity for some good work. Let someone develope a fruit for the purpose. It ought not to be more difficult than some of the work that has been done.

* * *

A cherry not often seen, yet one of the best in flavor is the Princess Eugenie. It is slow to bear, which is the chief reason for its neglect, though production if given time, for a sour cherry it has few equals.

* * *

The shortage in raspberries is an encouragement to the strawberry grower. This fruit promises to be in good demand for some time to come.

* * *

Scions may be low cut now, and stored in moist sand or sawdust until wanted. Use last season's growth, discard the tip or immature wood.

* * *

Seedling apple trees in out-of-the-way places may be made useful at the cost of a little time and labor. If the trunks and limbs are sound they make the best of stock for grafting. Put in some Delicious, Steel's Red or Grime's Golden. They do well on vigorous natural stock.

* * *

Japanese plums are poor self-pollenizers. It is not safe to plant one variety alone Abundance or Burbank when sanding alone may blossom freely. then shed their fruit. Much disappointment has resulted from this. Grow at least two kinds.

* * *

The plum can be grafted, but the varieties should have similiar habits of growth. To graft Burbank and Abundance would result in a freakish tree in looks, at least.

* * *

Why not grow more currants? They soon begin to bear and there is a ready market for the fruit. The plants are scarce and expensive, but it is not difficult for one to grow his own. Make cuttings and plant them this spring. Foy's Prolifer, Cherry and Wilder are good market varieties, but for jelly it is hard to beat the old Red Dutch, though the fruit is small. It is very productive too. The greatest enemy is the current worm, but that is easily controlled.

* * *

Peach trees ought to be sprayed for leaf curl. Copper sulphate at the rate of one pound to 50 gallons of water, no line, may be used at any time when the liquid will not freeze, the earlier in the spring, the better.

CAN RECOVER DAMAGE

(Continued from Page 7)

my place, but he kept her moving around so we did not notice her being sick when she was unloaded, but noticed it shortly afterwards. She lost her calf, and will not get with calf now. I had a veterinary and he said it was caused by moving her. I have got proof that the cow was sick before he got to my place.—J. L., Midland, Mich.

—If you can show that the seller was negligent in delaying to remove the cow, or that he failed to use proper care in moving her, and that as a result of such negligence she lost her calf, I think you would have a right of action against him to recover the damage you have suffered. —Asst. Legal Editor.

TRY TO HAVE CHILD ADOPTED

I have a step daughter that has had ephleptic fits for five years. At the age of 17 she gave birth to a baby which is now 11 months old. I took this matter up with our prosecutor. She told him who the baby's father was and he was a poor married man. The prosecutor said he could not do anything for the reason the girl's mind was too bad for evidence against him. The girl now has gone to a home, and the baby is left with me. Is there any support I can get for such a child? If so, will you please tell me whom to apply to, and how to do this. The baby must have support.—F. C. T., Mecosta County, Mich.

—If the legability of the father for the child's support cannot be enforced, it would become the duty of the county or township to provide such support. However, if you cannot take care of the child, you should make every effort to have it adopted by some private family or sent to some good orphans home, so it will not become a public charge. It should be realized that the child is the innocent victim of unfortunate circumstances over which it had no control, and is as deserving of a fair chance in life as if born in lawful wedlock.—Asst. Legal Editor.

FINISHING MAPLE FLOORS

What is the most successful method of finishing a hard maple or elm floor in a light finish?—H. B. A., Otisville, Mich.

—The following formula for finishing maple floors has proved very satisfactory for several years:

Boiled linseed oil, ½ gal.; raw linseed oil, ½ gal.; turpentine, 2⅛ pints; Japan dryer, ¼ pint; bees wax, ¼ pound.

Shave or cut the wax in small pieces and dissolve in the turpentine. Heat wax and turpentine by setting in a dish of hot water. When hot add Japan dryer and mix with the oil.

For new floors apply by dipping a soft rag or waste into the oil and rub into floor until thoroughly covered. Let stand about one-half hour. Then wipe thoroughly dry with rags or waste. Burn oily rags at once. Let floor stand 3 or 4 days until thoroughly dry. Then finish with wax or varnish as desired.

Elm floors are more open grained and will need a light paste wood filler the first application—S. B. Howard, College Painter, M. A. C.

COULD NOT COLLECT FEE

Will you please tell me whether a note is legal drawn up in this manner? A buys from B, cattle amounting to $450.00. B tells A that C has money to loan. B goes and talks with C, comes and gets A, A and B goes to C, C makes out he will have to go to Reed City Bank to get the money, and his fee would be $25.00 and a bonus of $25.00. C draws up note for $500.00 payable one year with 7 per cent interest. C is a stockholder and director of the local bank. C presents note to cashier, takes $25.00. A gets $450.00 and the bank gets the rest. Would this note be collectable?—C. H. S., Evart, Mich.

—The $25.00 charged by the bank as a bonus would be usurious and could not be collected from the maker of the note. If C is a director of the bank loaning money, I am of the opinion he could not collect from A the $25.00 charged as his fee.—Asst. Legal Editor.

INDORSER RELEASED

Please give me information in regards to a note. A sells a horse to B for $80.00 taking a property note and C indorses note with B. There A sells note to the bank and endorses same. I don't know whether note was recorded or not. Then B moves and gets an extension of time on this note, has the interest charged to note. During this 30 days extention, B has a sale and moves away taking horse with him, afterwards selling it. Now the bank insists upon C paying the note. C was not notified that the note was not paid until after the 30 day extension had expired. Is C liable to pay or should A pay, and take his property with his property note?—J. V., Remus, Michigan.

—Where an extension of time is given to the maker of a note, an accommodation indorser thereon is released if such extension was given without his knowledge.—Asst. Legal Editor.

DO NOT PUT KEROSENE IN GASOLINE CAN

—Would like to know if it is lawful to put kerosene in gasoline cans?—F. V., Fremont, Mich.

—The statutes expressly prohibit the putting of kerosene in gasoline cans. The law provides that gasoline containers be painted red to make errors of this nature next to impossible.—Chas. J. DeLand, Secretary of State.

KEY

L.—Polarine Light.

M.—Polarine Medium

H.—Polarine Heavy

S.H.—Polarine Special Heavy.

E.H.—Polarine Extra Heavy.

N. B. For recommendations of grades of Polarine to use in automobiles and trucks consult chart at any Standard Oil Co. (Indiana) station.

Any number of engine troubles are due to improper lubrication. If you are not using Polarine, you are not getting *all* the power your engine is capable of delivering—nor all the economy. Polarine will avoid undue strain. It will avoid worn bearings and scored cylinders.

Polarine gets into action the moment the engine starts, because its viscosity is scientifically correct—its body stable, without being heavy. It spreads quickly forming a perfect film between all the moving metal surfaces.

Polarine is scientifically adapted to develop the full efficiency of your engine. The grade of Polarine specified in the Chart is specified by our Board of Lubricating Engineers, who know the design and construction of your tractor.

Get Polarine

THE PERFECT MOTOR OIL

Made in Five Grades

It is the oil chosen by the farmer who wants economy and power from his tractor. Polarine is a specialized product—made only from crudes chosen for their high lubricating properties.

Polarine avoids carbon troubles. This is proved by hundreds of tests, in the laboratory and in the field. Specify Polarine. The length of life of your engine is involved.

CHAPTER XVII

HALF an hour later Blackton had shown Aldous to his room and bath. It was four o'clock when he rejoined the contractor in the lower room, freshly bathed and shaven and in a change of clothes. He had not seen Joanne, but half a dozen times he had heard her and Peggy Blackton laughing and talking in Mrs. Blackton's big room at the head of the stairs, and he heard them now as they sat down to smoke their cigars. Blackton was filled with enthusiasm over the accomplishment of his latest work, and Aldous tried hard not to betray the fact that the minutes were passing with gruelling slowness while he waited for Joanne. He wanted to see her. His heart was beating like an excited boy's. He could hear her footsteps over his head, and he distinguished her soft laughter, and her sweet voice when she spoke. There was something in her nearness and the fact that she did not once show herself at the top of the stair. Blackton was still talking about "coyotes" and dynamite when, an hour later, Aldous looked up, and his heart gave a big, glad jump.

Peggy Blackton, a plump little golden-haired vision of happiness, was already half a dozen steps down the stairs. At the top Joanne, for an instant, had paused. Through that space, before the contractor had turned, her eyes met those of John Aldous. She was smiling. Her eyes were shining at him. Never had he seen her look at him in that way, he thought, and never had she seemed such a perfect vision of loveliness. She was dressed in a soft, clinging something with a flutter of white lace at her throat, and as she came down he saw that she had arranged her hair in a marvellous way. Soft little curls half hid themselves in the shimmer of rich coils she had wreathed upon her head, and adorable little tendrils caressed the lovely flush in her cheeks, and clung to the snow-whiteness of her neck.

For a moment, as Peggy Blackton went to her husband, he stood very close to Joanne, and into his eyes she was smiling, half laughing, her beautiful mouth aquiver, her eyes glowing, the last trace of their old suspence and fear vanished in a new and wonderful beauty. He would not have said she was twenty-eight now. He would have sworn she was twenty.

"Joanne," he whispered, "you are wonderful. Your hair is glorious!"

"Always—my hair," she replied, so low that he alone heard. "Can you never see beyond my hair, John Aldous?"

"I stop there," he said. "And I marvel. It is glorious!"

"Again!" And up from her white throat there rose a richer, sweeter color. "If you say that again now, John Aldous, I shall never make curls for you again as long as I live!"

"For me——"

His heart seemed near bursting with joy. But she had left him, and was laughing with Peggy Blackton, who was showing her husband where he had missed a stubby patch of beard on his cheek. He caught her eyes, turned swiftly to him, and they were laughing at him, and there came a sudden pretty upturn to her chin as he continued to stare, and he saw again the color deepening in her face. When Peggy Blackton led her husband to the stair, and drove him up to shave off the stubby patch, Joanne found the opportunity to whisper to him.

"You are rude, John Aldous! You must not stare at me like that!"

And as she spoke the rebellious colour was still in her face, in spite of the tantalizing curve of her red lips and the sparkle in her eyes.

"I can't help it," he pleaded. "You are—glorious!"

During the next hour, and while they were at supper, he could see that she was purposely avoiding his eyes, and that she spoke oftener to Paul Blackton than she did to him, apparently taking the keenest interest in his friend's enthusiastic descriptions of the mighty work along the line of steel. And as pretty Peggy Blackton never seemed quite so happy as when listening to her husband, he was forced to content himself by looking at Joanne most of the time, without once receiving a smile.

The sun was just falling behind the western mountains when Peggy and Joanne, hurried most incontinently by Blackton, who had looked at his watch left the table to prepare themselves for the big event of the evening.

"I want to get you there before dusk," he explained. "So please hurry!"

They were back in five minutes. Joanne had slipped on a long gray coat, and with a veil that trailed a yard down her back she had covered her head. Not a curl or a tress of her hair had she left out of its filmy prison, and there was a mischievous gleam of triumph in her eyes when she looked at Aldous.

A moment later, when they went ahead of Blackton and his wife to where the buckboard was waiting them, he said:

"You put on that veil to punish me, Ladygray?"

"It is a pretty veil," said she.

"But your hair is prettier," said he.

"And you embarrassed me very much by staring as you did, John Aldous!"

"Forgive me. It is—I mean you are—so beautiful."

"And you are sometimes—most displeasing," said she. Your ingenuousness, John Aldous, is shocking!"

"Forgive me," he said again.

"And you have known me but two days," she added.

"Two days—is a long time," he argued. "One can be born, and live, and die in two days. Besides, our trails have crossed for years."

"But—it displeases me."

"What I have said?"

"Yes."

"And the way I have looked at you?"

"Yes."

Her voice was low and quiet now, her eyes were serious, and she was not smiling.

"I know—I know," he groaned, and there was a deep thrill in his voice. "It's been only two days after all, Ladygray. It seems like—like a lifetime. I don't want you to think badly of me. God knows I don't!"

"No, no, I don't," she said quickly and gently. "You are the finest gentleman I ever knew, John Aldous. Only—it embarrasses me."

"I will cut out my tongue and put out my eyes——"

"Nothing so terrible," she laughed softly. "Will you help me into the wagon? They are coming."

She gave him her hand, warm and soft; and Blackton forced him into the seat between her and Peggy, and Joanne's hand rested in his arm all the way to the mountain that was to be blown up, and he told himself that he was a fool if he were not supremely happy. The wagon stopped, and he helped her out again, her warm little hand again close in his own, and when she looked at him he was the cool, smiling John Aldous of old, so cool, and strong, and unemotional that he saw surprise in her eyes first and then that gentle, gathering glow that came when she was proud of him, and pleased with him. And as Blackton pointed out the mountain she unknotted the veil under her chin and let it drop back over her shoulder, so that the last light of the day fell richly in the trembling curls and thick coils of her hair.

"And that is my reward," said John Aldous, but he whispered it to himself.

They had stopped close to a huge flat rock, on this rock men were at work fitting wires to a little boxlike thing that had a white button-lever. Paul Blackton pointed at this, and his face was flushed with excitement.

"That's the little thing that's going to blow it up, Miss Gray—the touch of your finger on that little white button. Do you see that black base of the mountain yonder?—right there where you can see men moving about? It's half a mile from here, and the 'coyote' is there, dug into the wall of it."

The tremble of enthusiasm was in his voice as he went on, pointing with his long arm: "Think of it! We're spending a hundred thousand dollars going through that rock that people who travel on the Grand Trunk Pacific in the future will be saved seven minutes in their journey from coast to coast! We're spending a hundred thousand there, and millions along the line, that we may have the smoothest roadbed in the world when we're done, and the quickest route from sea to sea. It looks like a waste, but it isn't. It's science! It's the fight of competition! It's the determination behind the forces—the determination to make this road the greatest road in the world! Listen!"

The gloom was thickening swiftly. The black mountain was fading slowly away, and up out of that gloom came now ghostly and far-reaching voices of men booming faintly through giant megaphones.

"Clear away! Clear away! Clear away!" they said, and the valley and the mountain-sides caught up the echoes, until it seemed that a hundred voices were crying out the warning. Then fell a strange and weird silence, and the echoes faded away like the voices of dying men, and all was still save the far-away barking of a coyote that answered the mysterious challenges of the night. Joanne was close to the rock. Quietly the men who had been working on the battery drew back.

"It is ready!" said one.

"Wait!" said Blackton, as his wife went to speak. "Listen!"

For five minutes there was silence. Then out of the night a single megaphone cried the word:

"Fire!"

"All is clear," said the engineer, with a deep breath. "All you have to do , Miss Gray, is to move that little lever from the side on which it now rests to the opposite side. Are you ready?"

In the darkness Joanne's left hand had sought John's. It clung to his tightly. He could feel a little shiver run through her.

"Yes," she whispered.

"Then—if you please—press the button!"

Slowly Joanne's right hand crept out, while the fingers of her left clung tighter to Aldous. She touched the button—thrust it over. A little cry that fell from between her tense lips told them she had done the work, and a silence like that of death fell on those who waited.

A half a minute—perhaps three-quarters—and a shiver ran under their feet, but there was no sound; and then a black pall, darker than the night, seemed to rise up out of the mountain, and with that, a second later came the explosion. There was a rumbling and a jarring, as if the earth were convulsed under foot: volumes of dense black smoke shot upward, and in another instant these rolling, twisting volumes of black became lurid, and an explosion like that of a thousand great guns rent the air. As fast as the eye could follow sheets of flame shot up out of the sea of smoke, climbing higher and higher, in lightning flashes, until the lurid tongues licked the air a quarter of a mile above the startled wilderness. Explosion followed explosion, some of them coming in hollow, reverberating booms, others as if in mid-air. Unseen by the watchers, the heavens were filled with hurtling rocks; solid masses of granite ten feet square were thrown a hundred feet away; rocks weighing a ton were hurled still farther, as if they were no more than stones flung by the hands of a giant; chunks that would have crashed from the roof to the basement of a skyscraper dropped a third of a mile away. For three minutes the frightful convulsions continued, and the tongues of flame leaped into the night. Then the lurid lights died out, shorter and shorter grew the sullen flashes, and then again fell—silence!

During those appalling moments, unconscious of the act, Joanne had shrank close to Aldous, so that he felt the soft crush of her hair and the swift movement of her bosom. Blackton's voice brought them back to life.

He laughed, and it was the laugh of a man who had looked upon work well done.

"It has done the trick," he said.

"To-morrow we will come and see. And I have changed my plans about Coyote Number Twenty-eight. Hutchins, the superintendent, is passing through in the afternoon, and I want him to see it." He spoke now to a man who had come up out of the darkness. "Gregg, have Twenty-eight ready at four o'clock to-morrow afternoon—four o'clock—sharp!"

Then he said:

"Dust and a bad smell will soon be settling about us. Come, let's go home!"

And as they went back to the buckboard wagon through the gloom John Aldous still held Joanne's hand in his own, and she made no effort to take it from him.

CHAPTER XVIII

THE next morning, when Aldous joined the engineer in the dining-room below, he was disappointed to find the breakfast table prepared for two instead of four. It was evident that Peggy Blackton and Joanne were not going to interrupt their beauty nap on their account.

Blackton saw his friend's inquiring look, and chuckled.

"Guess we'll have to get along without 'em this morning, old man. Lord bless me, did you hear them last night—after you went to bed?"

"No."

"You were too far away," chuckled Blackton again, "I was in the room across the hall from them. You see, old man, Peggy sometimes gets fairly starved for the right sort of company up here, and last night they didn't go to bed until after twelve o'clock. I looked at my watch. Mebby they were in bed, but I could hear 'em buzzing like two bees, and every little while they'd giggle, and then go on buzzing again. By George, there wasn't a break in it! When one let up the other'd begin, and sometimes I guess they were both going at once. Consequently they're sleeping now."

When breakfast was finished Blackton looked at his watch.

"Seven o'clock," he said. "We'll leave word for the girls to be ready at nine. What are you going to do meantime, Aldous?"

"Hunt up MacDonald, probably."

And I'll run down and take a look at the work."

As they left the house the engineer nodded down the road. MacDonald was coming.

"He has saved you the trouble," he said. "Remember, Aldous—nine o'clock sharp!"

A moment later Aldous was advancing to meat the old mountaineer.

"They've gone, Johnny," was Donald's first greeting.

"Gone?"

"Yes. The whole bunch—Quade, Culver Rann, DeBar, and the woman who rode the bear. They've gone, hide and hair, and nobody seems to know where."

Aldous was staring.

"Also," resumed old Donald slowly, "Culver Rann's outfit is gone—twenty horses, including six saddles. An' likewise others have gone, but I can't find out who."

"Gone!" repeated Aldous again.

MacDonald nodded.

"And that means——"

"That Culver Rann ain't lost any time in gettin' under way for the gold," said Donald. "DeBar is with him, an' probably the woman. Likewise three cut-throats to fill the other saddles. They've gone prepared to fight."

"And Quade?"

Old Donald hunched his shoulders, and suddenly John's face grew dark and hard.

"I understand," he spoke, half under his breath. "Quade has disappeared—but he isn't with Culver Rann. He wants us to believe he has gone. He wants to throw us off our guard. But he's watching, and waiting—somewhere—like a hawk, to swoop down on Joanne! He——"

"That's it!" broke in MacDonald hoarsely. "That's it, Johnny! It's his old trick—his old trick with women. There's a hundred men who've got to do his bidding—do it 'r get out of the mountains—an' we've got to watch Joanne. We have, Johnny! If she should disappear—"

Aldous waited.

"You'd never find her again, so 'elp me God, you wouldn't, Johnny!" he finished.

"We'll watch her," said Aldous quietly. "I'll be with her to-day, Mac, and to-night I'll come down to the camp in the coulee to compare notes with you. They can't very well steal her out of Blackton's house while I'm gone."

For an hour after MacDonald left him he walked about in the neighborhood of the Blackton bungalow smoking his pipe. Not until he saw the contractor drive up in the buckboard did he return. Joanne and Peggy were more than prompt. They were waiting. If such a thing were possible Joanne was more radiantly lovely than the night before. To Aldous she be came more beautiful every time he looked at her. But this morning he did not speak what was in his heart when, for a moment, he held her hand, and looked into her eyes. Instead, he said:

"Good morning, Ladygray. Have you used——"

"I have," she smiled. "Only it's Potterdam's Tar Soap, and not the other. And you—have not shaved, John Aldous!"

"Great Scott, so I haven't!" he exclaimed, rubbing his chin. "But I did yesterday afternoon, Ladygray!"

"And you will again this afternoon, if you please," she commanded. "I don't like bristles."

"But in the wilderness——"

"One can shave as well as another can make curls," she reminded him, and there came an adorable little dimple at the corner of her mouth as she looked toward Paul Blackton.

Aldous was glad that Paul and Peggy Blackton did most of the talking that morning. They spent half an hour where the explosion of the night before had blown out the side of the mountain, and then drove on to Coyote Number Twenty-eight. It was in the face of a sandstone cliff, and all they could see of it when they got out of the wagon was a dark hole in the wall of rock. Not a soul was about, and Blackton rubbed his hands with satisfaction.

"Everything is completed," he said. Gregg put in the last packing this morning, and all we are waiting for now is four o'clock this afternoon."

The hole in the mountain was perhaps four feet square. Ten feet in front of it the engineer paused, and pointed to the ground. Up out of the earth came two wires, which led away from the mouth of the cavern.

"Those wires go down to the explosives," he explained. They're battery wires half a mile long. But we don't attach the battery until the final moment, as you saw last night. There might be an accident."

He bent his tall body and entered the mouth of the cavern, leading his wife by the hand. Observing that Joanne had seen this attention on the contractor's part, Aldous held out his own hand, and Joanne accepted it. For perhaps twenty feet they followed the Blacktons with lowered heads. They seemed to have entered a black cold pit, sloping slightly downward, and only faintly could they see Blackton when he straightened.

Hs voice came strange and sepulchral:

"You can stand up now. We're in the chamber. Don't move or you might stumble over something. There ought to be a lantern here."

He struck a match, and as he moved slowly toward a wall of blackness, searching for the lantern, he called back encouragingly through the gloom:

"You folks are now standing right over ten tons of dynamite, and there's another five tons of black powder——"

A little shriek from Peggy Blackton stopped him, and his match went out.

"What in heaven's name is the matter?" he asked anxiously. "Peggy——"

"Why in heaven's name do you light a match then, with us standing over all those tons of dynamite?" demanded Peggy. "Paul Blackton, you're——"

The engineer's laughter was like a giant's roar in the cavern, and Joanne gave a gasp, while Peggy shiveringly caught Aldous by the arm.

(Continued April 14th Issue)

DAIRYMEN WIN TWO VICTORIES

The dairy interests of the United States succeeded in securing at the hands of the 67th Congress, two pieces of legislation which mark real progress. The Voight Anti-Filled Milk Bill prohibiting filled milk in interstate commerce was passed on March 1. The Haugen Butter Standards Bill was passed two days later.

PETOSKEY Potatoes

"Rural Russets"
King of the Late Potatoes!
Resists heat, drought and disease.

Our Michigan grown Certified Seed Potatoes produce the largest yields. In 1922 Certified Petoskeys gave Michigan growers 61 bushels per acre more than the yield from all kinds of seed.

In Indiana, Certified potatoes out-yielded ordinary stock fifty bushels per acre.

Production costs were the same except the small additional cost of Certified Seed.

If your Local Cooperative Association or County Agent cannot take your order write to

"The Farm Paper of Service"

THE following news note has been going the rounds of the newspapers:

WHO GOT THE 96 CENTS?

NOTE IN A POTATO SHOWS PRICE ROSE 400 PER CENT.

Lynchburg, Va., March 8.—Mrs. W. J. Crowder of this city, while peeling a potato found a note in it reading:

"I got 24 cents per bushel. What did you give?"

It was signed "G. F. Beardsley, Stanton, Michigan."

Mrs. Crowder said she paid 30 cents a peck, or at the rate of $1.20 a bushel.

"FARMERS GETTING DISCOURAGED AND QUITTING!"

> "Farmers all around here are getting discouraged and quitting. There have been more Auction Sales around here this past winter than ever before. Within the last two or three weeks there have from one to four sales every week, within a radius of ten to fifteen miles and in most cases the heading of the bill says, "having decided to quit farming I will sell at Auction", and nearly all of them go to town or city to work. I wonder how much longer it will be before the towns are filled up."

FROM Rockford comes this letter from an earnest business farmer who thus bewails the fact that farmers, in his locality, are "getting discouraged and quitting!"

Let's take out our pencils a minute and do a simple problem in economics—you never learned economics?—well, sit in close and get a lesson in what Dr. Friday calls economics, but what perhaps you have always called "putting-two-and-two together" or practicing "common-horse-sense!" As near as we can figure out, they amount to the same thing—basing predictions on experience, we all do that!

"Farmers getting discouraged and quitting" to move to town!

Don't sigh, neighbor, throw your hat in the air! Here's your neighbor, his wife and three children; five mouths to feed. Five producers, all working hard to grow more crops to feed themselves and other mouths somewhere in the cities.

They move to town! He has a "good" job in a factory, going to work before sun-up every morning and working in a spray of paint, painting wheels all day, until it is nearly dark again and he can stand in line to get on a crowded street car and become another of the human sardines, but that is another part of the story!

Five pairs of hands that were producers, move to the city and become five mouths which are consumers! Supply less—Consumption greater! What happens? Prices for farm products higher.

So there really is nothing to be glum about, unless you miss the social life of your neighbors and we might suggest, that more money from your crops will buy you a better automobile, that will bring you near all the social life that will be good for you.

Didn't know you could do a problem in simple economics, did you?

But it is mighty comforting, if a lot of misguided farmers and farmers' sons and daughters don't discover how simple it is, figure it out for themselves and decide to stay right where they are and continue to be producers!

AND HIS WORK ONLY BEGUN!

IT seems but yesterday and in reality it was only a few weeks back that we wished Milo Campbell good luck and God-speed on his departure to take up his work as a member of the Federal reserve board, to which President Harding had so wisely called him.

Milo Campbell dropped dead from heart failure in Washington on March twenty-second, less than ten days after he had left his home in Coldwater to take up his work and residence in the capital.

Every earnest business farmer in Michigan will regret the passing of a man who contributed so much to the agricultural welfare of this state. Mr. Campbell was 72 years of age when he laid down his work, having been born in New York state, of English parents, he came to Michigan in 1848 and settled at Quincy. He graduated from the Coldwater High School in 1871 and from the state normal at Ypsilanti in 1875. In 1877 he was admitted to the bar, practicing in Coldwater, with the Honorable Clayton C. Johnson, now circuit judge, as his law partner.

Mr. Campbell held several political appointments during his busy life-time, and ran for governor of the state of Michigan, with the general support of the rural districts because of his years of work in their interests.

Probably the position which brought him the widest acquaintance nationally, was his election to presidency of the National Milk Producers Association where he was instrumental in suggesting and pushing to a successful issue several important innovations in the milk situation for the benefit of the producer.

There is a genuine loss to Michigan and to the farmers of this entire country in the passing of Milo Campbell, but the record of his life and his achievements should shine forth as a beacon to those of us who are left behind to humbly pattern the course of our footsteps after his.

EAT MORE WHEAT!

A FEW years ago and it was "Save Wheat for the Fighters—It will Win the War!", now from the north-west in particular comes the appeal—"Eat-more-Wheat!"—and it is justified, because every year American wheat producers meet a curtailed export market because of millions of acres of new wheat lands under cultivation in other parts of the world and during the past few years a money-value condition which has taken white bread off the tables of millions of people in central Europe.

The time was when we were wont to smile at such appeals as "Buy-a-Bale-of-Cotton" or when we figured that the National Raisin Day, was only a half-baked scheme of a promoter, who really had little faith in its effect. To-day, however after years of experience with this open propaganda, we have come to know exactly what may be expected from a campaign to educate the great mass of people to an idea.

Two weeks ago there was a "bread-war" in Chicago between two lines of so-called chain-stores, each operating several hundred retail stores in all parts of that city. When the war opened a small loaf of bread was retailing at nine cents, one chain of stores cut the price to eight, down went the other and so until it was two-loaves-for-a-cent, whereupon the last chain offered "Bread Free!" with every purchase and within a few days had forced a truce upon their rivals.

The price of bread and the price of flour will have a lot to do with the success of a "Eat-more-Wheat!" campaign and if the miller will allow the farmer a fair price for his wheat, add a fair margin for his milling and pass it on to the baker or home with the least possible over-head we believe this, coupled with a popular appeal to the more than a hundred millions in America will have its effect.

THE SUGAR MARKET

JUST now the sugar market is turning hand-springs and getting ready so it appears, for some high and lofty tumbling. No one seems to know from just what direction the manipulating is being done, but several gentlemen in Washington, including Secretary of Commerce Hoover, are very anxious to find out and they seem to have an inkling that it may come from a certain well known street in lower New York, altho it is carefully wrapped and labeled "made in Havana"!

It is such a long time before the 1923 beet sugar crop from Michigan will be on the market, that we would scarcely advise beet growers to become panicky and plant more acreage than they had originally planned, altho we would not hesitate to advise the signing of the "50-50" contract, because we still hold that over a period of three seasons the grower cannot help but profit from this contract that gives him an equal share of the possible profits—providing, of course, he is given a square-deal and The Business Farmer has promised that it will help, at least, to see that the beet-growers of Michigan get that.

THE PORTS OF MICHIGAN

IN a very few years, fewer than many realize, the Great Lakes-St. Lawrence Waterway will be a completed project. Its future value, however, as a commercial factor will largely depend upon the agressiveness of the ports along the Great Lakes. Ships are going to bring their cargoes and receive the same where proper facilities are provided to load goods at a fair charge.

Modern ports are far different from the old type ports of the early shipping days. Future requirements will mean still more changes which will demand very careful planning and a point of view that can see a long ways ahead. Even more essential than a clear vision on the matter, however, is the necessity for a public control of such port facilities which will assure to all who desire to use them that they shall have the fairest of treatments.

The tonnage of our lakes this past summer exceeded 200,000,000 tons. Two or three times the tonnage of both the Panama and Suez canals goes through the Soo locks every year. With the coming of ocean ships to our Great Lakes, this great highway of commerce is bound to grow to unprecedented importance if only our port cities will make it possible for this commerce to develop.

The present session of the legislature has recently passed a Port Development Amendment which is to be placed on the April 2nd ballot. This amendment to the constitution if adopted will be,

> "To authorize the Legislature to provide for the incorporation of port districts and confer power and authority upon them to engage in work of internal improvements in connection therewith."

This Amendment is a question on which it does not seem possible that negative votes can be cast with any sound reason. The future needs of every Michigan Port can best be gauged by the experience of every American port which indicates the necessity for immediately giving the legislature the power to create these port districts and make a start in the development of the water transportation of the State.

BRING THE CREDIT BILL HOME

IF you want to borrow money and have wondering just what all this talk about "extended credits" was going to mean to John Henry You—turn back to page three in this very issue of The Business Farmer and you will see the rural credits bill, analyzed, boiled-down and explained from the best authorities we could locate.

In a nutshell the value of the relief measure as adopted is going to be the extension of time allowed the producer of grains or live-stock in which he can market his product sanely and orderly. The oldest trick in history, has probably been the loaning of money to farmers on short time paper that came due just at the time the crop was being harvested, so that it was forced on the market, thus creating unnaturally low prices and consequent loss.

Of course, as with any innovation it would be easy to pick out the probable flaws in this piece of legislation. It has been roundly cussed by both those it is aimed to help and those it has promised to ruin. Republican and Democrat have united in defending and defaming this measure and yet it has won out and we are going to have a look at it in operation.

If you need money now for legitimate purposes in the conduct of your farming business, go to your local banker, sit down and talk over the situation with him frankly. State all of the facts regarding the loan you want. Do not try to cover or apologize for your actual needs. The legislation which has been enacted is avowedly for the benefit of you, the farmers of Michigan and every other state. If your local banker will not cooperate or cannot, in meeting your needs, let The Business Farmer hear from you and we will do our utmost to help get all the benefit possible from the new legislation for our readers in particular and for the whole farming business in general.

The Business Farmer is most anxious to see the credit machinery in actual operation and we are willing to lend our utmost support to that end.

PUBLISHER'S DESK

THE Publisher's Desk has been fairly swamped this past month with letters from hundreds of our readers who are in one kind of trouble or another, and we have attempted to the best of our ability to answer each promptly or to take any necessary action to secure the information which our readers have requested.

In a good many of these letters our readers tell us that they are willing to pay for our services, and I want you to know that the Business Farmer makes no charge of any kind to a paid-up subscriber, unless we find it necessary to supply legal assistance or expend money in some other manner, in which case, we will, in every instance, secure the written authority of our reader before we make any such expenditure.

You can always write the Publisher's Desk, knowing that there will be no charge for our services unless it is fully understood in advance, but I do wish that you would look at your subscription label before you write us, because we must confine this service to readers who are paid-up in advance, otherwise, naturally we would be taken advantage of by those who are not subscribers to the Business Farmer, or those who have not paid up. I think you will agree with us that this is no more than fair.

THE "COME-ON"

Dear Mr. Slocum—Will you please inform me through the columns of your valuable paper, to which I am a subscriber of the financial standing and reliability of the "Corporation" whose literature I herewith inclose. A lady friend of mine bought shares of their stock to the amount of about $1000.00 a couple of years ago, on which she has received cash dividends as high as five per cent, every three months. Last Oct. a representative of this "Corporation" informed my friend that all parties who had bought stock in the corporation were required to buy an additional number of shares of stock, the number of share being in proportion to the amount which they already held, and which in her case amounted to a cash payment of about $290.00, the additional call being made on stockholders for the purpose of creating a fund to enable the corporation to place its stock on the "curb" market. My friend paid her $290.00, signed some papers, the wording of which she did not understand, but which later proves to be a contract whereby she promises to buy 72 shares of stock at $16 per share, a total of $1,152.00 and that the $290.00 which she had paid was but the initial cash payment the balance of the $1,152.00, which is $862.00, being payable within six months or failing to do so she forfeits the $290.00 which she has paid.

My friend was given a written agreement which states that after thirty days or more, should she become dissatisfied with her investment, her money would be refunded upon request.

I am willing to pay you any reasonable amount which you may request for information which you will give or obtain for me regarding this corporation's financial standing, reliability, etc. Please do not publish my name."

* * *

I am reprinting the above letter in this column only because it illustrates the manner in which the "Oil Shark" operates, once he has a victim in his clutches he has many oily schemes with which to extract more money than the purchaser originally intended.

The Collection Box

The purpose of this department is to protect our subscribers from fraudulent dealings or unfair treatment by persons or concerns at a distance.

In every case we will do our best to make a satisfactory settlement or force action, for which no charge for our services will ever be made, providing:

1.—The claim is made by a paid-up subscriber to The Business Farmer.

2.—The claim is not more than 6 mos. old.

3.—The claim is not local or between people within easy distance of one another. These should be settled at first hand and not attempted by mail.

Address all letters, giving full particulars, amounts, dates, etc., enclosing also your address label from the front cover of any issue to prove that you are a paid-up subscriber.

THE BUSINESS FARMER, Collection Box
Mt. Clemens, Mich.

Report Ending March 27, 1923

Total number claims filed	1192
Amount involved	$21,214.29
Number of claims settled	723
Amount secured	$11,699.64

We wonder sometimes why a person will go so far afield to find an investment, or when the speculation is so wide as it is in the case of oil wells, or mining stock. They do say however, that most men and women at some time or other in their lives, take a fling at these two kinds of speculative investments; like the child who will not beleive that the stove is hot until it has burned it's tiny fingers! Although continually warned, there seems to be no end to the game, and it goes merrily along from generation to generation.

* * *

By-the-way, the most appropriately named oil well proposition that I have seen in some time, was sent in by a reader who asked what I thought of the "Rainbow's End Company, Unincorporated, Oklahoma City, Okla."

I don't know anything in particular about this company, anymore than that their advertising is very sensational, and I don't beleive I would care to invest in their proposition which is to lease at the rate of $1 per acre, with the understanding that "should oil not be produced on or before January 16th, 1929, the lease dies a natural death."

They must be getting hard up for names out in the Texas and Oklahoma district, when they call an oil company "Rainbow's End." I wonder if any company has grabbed the title "Will-O-the-Wisp?" That would in my opinion be equally appropriate.

A SORRY PLIGHT

Last summer an agent who gave his name and address as, Geo. McCanna, 416 East Water St., Milwaukee, Wis., called at our house and said he was selling an automobile polish receipt for twenty dollars. As I am a cripple, and I have a hard time getting any money, he said he would give it to me for ten dollars. I did not have ten dollars, so he said he would give it to me for five dollars. I bought the receipt from him. He said I could make the polish for fifty cents a gallon and sell it for four dollars a gallon. I gave the receipt to our druggist, he told me it would cost about $2.75 per gallon, for the ingredients, besides the bottles and labels. I hope you can get my five spot back through the collection box.

What do you think about those hand knitting machines, put out by the "Auto Knitter Hosiery" concerns.

Are these reliable companies? Are their machines all right, so that anybody can knitt socks on them. I mean people who are able to understand the machines—bright minded people? As I am a cripple and can not go away from home to work all day, I would like to buy one of these machines but some people say you cannot make the complete sock on the machine, so I am afraid to buy one.

—I am sorry I cannot help this unfortunate reader collect the amount he paid the agent over a year ago. We cannot handle claims over six months old. We have found there is little possibility of making collections of that age.

I can, however, save the reader money on buying a knitting machine, if he is determined to have one, altho I have yet to find anyone making a success of this scheme. I am sorry because I realize how much this reader would like to procure home work.

There are several cripples in Michigan who have built up a business taking subscriptions for papers and magazines, sending out circulars to their friends or to mailing lists in their counties. Perhaps this might be a suggestion for our friend who certainly has my sympathy and whom I would like to help in some way. Has any reader a suggestion to offer this ambitious, tho unfortunate neighbor.

Your warning about the land agent just in time as I was about to send $4.50 to have my place listed.—H. J. H., Sanilac county, Mich.

4 TIMES Around the World with ONE OILING
100,000 Miles Without Stopping for Oil

An inventor who could develop an automobile, a railroad car or any other conveyance on wheels which would perform such a feat would be considered a wonder. But such is the record of regular accomplishment by the Auto-oiled Aermotor during the past eight years in pumping water.

Did you ever stop to think how many revolutions the wheel of a windmill makes? If the wheel of an Aermotor should roll along the surface of the ground at the same speed that it makes when pumping water it would encircle the world in 90 days, or would go four times around in a year. It would travel on an average 275 miles per day or about 30 miles per hour for 9 hours each day. An automobile which keeps up that pace day after day needs a thorough oiling at least once a week. Isn't it marvelous, then, that a windmill has been made which will go 50 times as long as the best automobile with one oiling?

The **Auto-oiled Aermotor** after 8 full years of service in every part of the world has proven its ability to run and give the most reliable service with one oiling a year. The double gears, and all moving parts, are entirely enclosed and flooded with oil all the time. It gives more service with less attention than any other piece of machinery on the farm. To get everlasting wind-mill satisfaction buy the Auto-oiled Aermotor, the most efficient windmill that has ever been made.

What the Neighbors Say

TOO MANY OFFICIALS WITH HIGH SALARIES

SINCE the beginning of the World War there has been a mad scramble to supplant the old order of simpler American affairs with every sort and kind of Imperialism, and every sort of economic device imaginable. The concentric rings of this giant contest for survival of the fittest is now centered upon the farmer and his possessions.

An inventory of conditions shows the politicians have waxed fat on increased salaries for official jobs, the jobs have multiplied innumerably and every job is a planetary with a cluster of satelites of various little and functionary obligations. Equipment of the job that once consisted of a plain salary, an office, desk-room and modest clerical assistance, now involves all these in palatial and princely display and retinue. Auto conveyance and its operatives, electric fans and uniformed artists of the cuspidore. In the old saying, "the farmer feeds them all." It is not the feeding them that challanges his resentment but the little that most of them return for their services. We go out in the morning to feed the cows, presto—over night there has been a meeting of the Spook City Women's Club and an administrator of stables informs us our cows are facing the wrong point of the compass because they are nonresistant to T. B.

We stoke the furnace, and low—a fuel administrator has ordered choas out of consistency.

A farmer was asked "what is a fuel administration for?" Answer—"I don't know." A merchant was asked. Answer—"I don't know." A manufacturer was asked. Answer—"I don't know;" a coal dealer was asked. He pondered a moment and answered, "He's a damn nuisance to himself and a damage to the coal business." Then related how recently in the city of Greenville, Mich., a man seeking to engage in the coal business ordered a car of coal and a dealer's license. The coal came. The fuel administrator stated there were several dealers already doing business in Greenville and no need of more. The license was refused. Did I err when I said Imperialistic forces have been involved? Were I to ask a politician why have a fuel administrator he would lay his finger beside his nose and wink, I think. I have been in politics a bit and can answer the question this way.

The fuel administrator, like scores of other jobs, chiefly constitutes one more spoke in political machinery, that depends on its appointive creations for its chief support and maintainance. Everywhere, the propelling votes of economic industry are overloaded with idler wheels represented by political jobs.

If our Legislation wants to do a good job that would considerably reduce taxes, let them get out their broad ax and decapitate one half the political jobs in the state. Then cut back the salaries of the rest of officialdom to a "state of normalcy" beginning with the Governor and passing down to the members of the town ship board. There would be plenty of staunch, capable men willing to accept place for the prestige in it and there would be much less incentive to attract idlerrs and gamblers in affairs of public welfare to public trust.—J. E. Taylor., Ionia County, Mich.

A REMEDY SUGGESTED

IN your issue of February seventeenth is an article by S. H. Slagle of Herrietta, endorsing an article be me published in your issue of December 9, 1922. The editor's comment on Mr. Slagle's article is of a nature to lead one to believe that the editor is opposed to any plea that would give the farmer the full value of the product of his toil; and the reason for his opposition is based on the fact that Russia has attempted something of that nature and as a result of the attempt a great many people have lost their lives.

This is not the time or place to denounce or commend the Russians for what they have so far accomplished. To my mind the great lesson for us to learn from Russia is to see that our own country does not become like old Russia to a degree that will cause the farmers and wage workers to attempt violence as a remedy for their economic ills.

Conditions always determine our actions. Hence, the blame for any loss of life must rest on those having the power to prevent injustice failing to do so, and not on those who, because of their suffering apply the only remedy apparent to them in their desperation caused by starvation.

The trouble with most of those who suggest remedies for the difficulties of the farmer and wage worker is that they have not studied the nature of the economic system under which we now operate.

The nature of the competitive system must have been very well mastered by the late Bishop Williams, otherwise he would not have been able to utter the following words of wisdom:

"If the Lord in desperation—pardon the phrase—should say, I will feed these downtrodden starving children of mine, and rain brown bread and molasses upon the earth, it would do nothing to help the poverty of the world under our present system. It would merely raise the value of the land where the fall was heaviest."

Henry Ford is another of the few who understand our present economic system, as witness the following taken from "The Intimate Life of Henry Ford," written by Allen L. Benson:

"Our men work eight hours a day for a living because it takes all they can earn in that time to maintain themselves and pay their share of the general wastefulness and inefficiency of the world. Our workingmen do not get full value for the wages they spend. Nobody does. Every time anybody pays more for a thing than it is should cost to produce and sell it, he is helping to support those who are not producers and also paying his part of the penalty for not organizing the world on a scientific basis. Earning a living will be the smallest part of our troubles once we have learned to do without parisites and without waste. Too many activities are now non-productive. That is partly because of our faulty industrial organization and partly because of parasitism."

President Harding in his message to Congress December eighth, 1922, among other suggestions gave us the following:

"The widespread gap between production costs and prices which consumers pay concerns every citizen of the Republic. It contributes very largely to the unrest in agriculture and must stand sponser for the familiar term—the high cost of living. No one doubts the excesses traceable to the levy of the middleman; but it would be unfair to charge him with all responsibility before we appraise what is exacted of him by our modernly complex life. We have attacked the problem on one side by the promotion of co-operative marketing and we might well inquire into the benefits of co-operative buying."

Considering the opinions of the eminent gentlemen above quoted, are we not justified in looking upon the critisms of the article by Mr. Slagle as being somewhat unwarranted.

In an effort to right their wrongs the people of a country will adopt methods of a voilent nature against their economic masters. Ability to co-operate for the general welfare is our only proof of intelligence. The higher the state of civilization, the greater the co-operation for the elimination of waste of every nature. In my article in your issue of December 9th I stated that I was working on a program for the industrial emancipation of all wealth producers and useful workers.

I herewith submit it for the critism of the editors and readers of The Business Farmer. As a test of the soundness of the idea, organize from fifty to one hundred retail stores in an equal number of the most promising communities, have one purchasing organization for the chain. The saving will be as follows:

Retailers average gross profit 25 per cent, wholesalers average gross profit 15 per cent, manufacturers selling cost 10 per cent. Total amount saved, 50 per cent, less cost of co-operative retailing 10 per cent. Net saving 40 per cent.

To enlarge upon this in this article would require too much space; but I will endeavor to answer all critisms that appear in The Business Farmer as a result of the suggested method.—Joseph Warnock, Presque Isle County, Mich.

A PIONEER

I HAVE lived in Tuscola county ever since 1861. I know the Cass river country from Sanalac county to Huron county both sides for miles each way. When it was a wilderness I was where Cass City now stands, before there was a tree cut down and at Caro when there was only one board house and pine stumps and logs.

I could turn a hand at any kind of labor; I could fill the place of a lumber jack or a village cop but was no drunkard and always associated with all kinds of company. I took the first Caro paper that was printed in Caro by Grant Slocum. I took that paper as long as it lived, so I want the Business Farmer. I could write a pioneer life for weeks to come. I also know something about Macomb county, also Detroit.—L. H. D., Vassar, Mich.

ISLE ROYALE

I AM enclosing to you Isle Royale, in verse. I know this represents the sentiment of this my Huron County

Oh, beautiful island of splendor,
Ringing back to those manors of old
The tale of the ages recording
Word pictures so weirdly told.

'Tis a church, in our heart, forever enshrined,
For 'tis in league with mountains of snow,
And the prows of leviathans are ever inclined
To do homage in passing, so proudly in tow.

Great inland seas pass by in review,
And mutely enquire the way,
Their passport, the smiles of citizens true,
Who have in those beauties forever portrayed.

The serried cedars in array,
Their sombre beauty makes appeal,
That woodman may their fate delay,
God knows their plaint is ever real.

The noble beech whose bosom bland,
Is scarred by names of many lands,
Yet, trite, and dignified she stands,
Her drooping boughs are angel Wands.

The pensive pine whose towering spire
Had beckoned pilgrims to the shrine,
She gave her all, that homestead fires
Might kindle love, supreme, divine.
—George J. Barrie, Huron County.

PUBLIC FUNDS

THE article of C. H. A., page 15, Michgan Business Farmer February 3d, is right to the point. I heartily indorse his views. Farmers must plan better laws and methods and see that they are enforced if they ever get out from under the present unjust taxes.

The public gives liberally for support of public schools, state and national government, etc., and by so doing the people are in reality furnishing the population the machinery of government, and the capital which makes great accumulations of wealth possible. No person ever earned a million dollars. It was accumulated from the public, and the major part should, by law and justice, be returned in taxes to the public to whom it rightfully belongs. It is said there are three ways of getting rich—by labor, by gift and by stealing. Now labor is honorable, gift will not stand law, and if any man has millions and has not justly compensated the public for it, he should hang his head in shame and his photo should be in the rogues' gallery along with the lesses rogues that try to follow his example.

Appointment to the federal bench of attorneys of the Pierce Butler type who have long served great corporations, is viewed with distrust and alarm. The initiative and recall, with election by direct vote of the people is the remedy.—V. P. S., Alamo, Mich.

MICHIGAN CROPS

SWEET CLOVER PASTURE

DURING the summer of 1921 the Dairy Department in cooperation with the Farm Crops Department conducted a feeding trail of biennial sweet clover as a pasture crop. The lot pastured was a portion of a field of sweet clover used by the Farm Crops Department in a series of investigations.

The test was started on June 4 when three cows were turned into the lot. The clover had made a good growth and was an excellent stand, being from 37 to 42 inches in height in different parts of the field. Over 40 per cent of the plants were in bud, and nearly 15 per cent were in bloom. Another portion of this same seeding was harvested as hay at the same date and produced two and three-fourths tons per acre.

The cows used in this experiment had previously been on a mixed grass pasture and fed silage and grain in the barn. During the experiment were given no silage or other roughage than the sweet clover pasture. The cows were given approximately one pound of grain to four pounds of milk produced, and were on pasture continuously except while they were being milked or weighed. The average weights taken for three consecutive days at ten day intervals were taken as the true weights of the cows.

A total of 177 cow days of pasturage was obtained from this plot containing 1.46 acres. The cows produced 6,088.6 pounds of milk and 201.0 pounds of butterfat. At this rate one acre furnished roughage for 4, 170.3 pounds of milk and 137.67 pounds of fat. During this time the average production per cow per day was 34.4 pounds of milk containing 1.135 pounds of fat. During the 177 cow days there were consumed 1,452.5 pounds of grain or approximately one pound of grain for every 4.2 pounds of milk produced. Figuring the grain at $40.00 per ton and milk at 20 cents a gallon, $69.07 worth of milk was produced from an acre of sweet clover. With grain at $40.00 per ton and butterfat worth 40 cents per pound the cows produced $26.02 worth of fat per acre of sweet clover.

The cows neither gained nor lost an appreciable amount, weighing in the total practically the same when taken from the clover plat as they did when they were started on the experiment.

When the cows were first turned on the sweet clover pasture they did not eat it readily. There was a very limited amount of orchard grass and June grass along one fence and this was cleaned up entirely before the cows would eat the sweet clover to any extent. It was three or four days before the cows evidently acquired a taste and ate the clover with relish. One cow in the experiment, however, was not turned into the pasture field until after the small amount of orchard grass had been entirely eaten and she ate the sweet clover readily the first day.

The cows were allowed to eat the sweet clover every day and at all times of the day, regardless of whether or not the clover was wet with dew or had been rained upon. In fact there were several heavy storms during which the cows received no shelter and were allowed to eat freely of the clover afterwards. During the time of the experiment no animal showed signes of bloating.

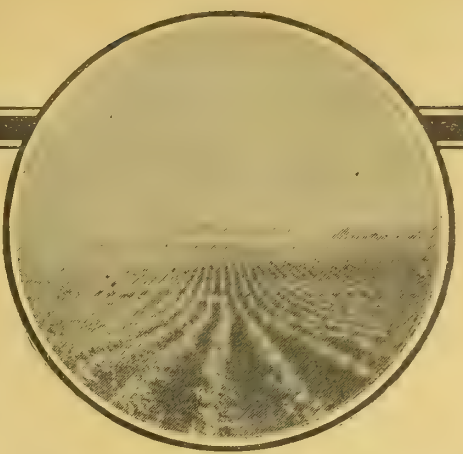
A considerable portion of the clover was destroyed, due to the trampling of the cattle and to their lying on it. Some of the main stems, after being trampled down, sent out new shoots. Without question, however, a considerable portion of the possible feed was lost in this way.

It is the belief of the authors that much greater value would have been obtained had it been possible to have turned the cattle on it three weeks earlier or before the sweet clover had obtained so much of a start. It is expected that this work will be carried on another year.—O. E. Reed, J. E. Burnett, Dairy Section.

POTATOES BOON TO MANKIND

THE lowly potato will now take on a new lease of life. Its position in the everyday standard of things must surely rise with the publication in Germany of a treatise on its many and varied uses, just received by the Department of Commerce from Vice Consul J. H. Wetmore at Breslau. Divers are the uses outlined. The first use of the potato is for the nourishing of man—in a raw or cooked state one cwt. is sufficient for one person for ninety days, with additional and usual food. In the form of potato flakes, 1 cwt. of raw potatoes gives 28 pounds of dry potatoes; the dried potatoes give 20.3 pounds of potato flour, 4.4 pounds of groats, and 3.3 pounds of waste. The second big use of potatoes is for the nourishing of animals—1 cwt. with other food feeding a hundred pound breeding hog 12 days. In the form of dried potatoes, calculated in starch values, 1 cwt. is equal to 1.15 cwt. of oats; therefore they are sufficient for a working horse for nine days. Compared with corn as a stock feed, 1 cwt. of potatoes produces 4.8 pounds of pork fat, 1 cwt. of dried potatoes 18.2 pounds and 1 cwt. of corn 20.2 pounds. The third possibility for potatoes is for technical purposes. In the manufacture of starch 1 cwt. of potatoes with 20 per cent starch gives 32 to 34 pounds wet, or 20 to 21 pounds dry starch, with a nadequate residue of pulp. The pulp is used for stock feed; in the distillery 1 cwt. of pulp gives 1 liter of pure alcohol; for the manufacturing of paper, buttons, broaches, and as fuel. On the other hand the dry starch is used as a foodstuff in bakeries, confectioneries, kitchens, and as potato grain for the manufacture of macaroni, noodles, chocolate, and for sausages. It also goes into vulnerary powders, paste bandages, pills, salves, and other pharmaceutical remedies. In other industries, potato starch is used as an addition in the manufacturing of ferments, washing powders and soaps, and as thickening filling for corrosives and colors. In a distillery, a hundredweight of raw potatoes produces 5 to 6 liters of pure alcohol and 80 to 90 liters of residuary liquors. The spirits are used for beverage purposes and for generating light. In the manufacture of dry yeast, 1 cwt of raw potatoes gives 6 pounds of the product.

A field of potatoes that any man would be proud to own



Michigan Farm Bureau Brands include the Best varieties of alfalfa, clover, seed grains and other field and grass seeds. Their Vitality, Description and Purity is guaranteed to be as represented to the full amount of the Purchase Price.

Certified Seed Corn · Beans · Soy Beans

Never before has it been possible to purchase in quantities at low prices such high yielding varieties of seed corn and beans in Michigan.

Farm Bureau Brands of Seed Corn are high yielding varieties most of which were developed through careful breeding at the Michigan Agricultural College and certified by the Michigan Crop Improvement Association.

They include certified M. A. C. Yellow Dent, Golden Glow, Duncan's Yellow Dent, Silver King, Pickett's Yellow Dent, also limited quantities of Illinois and Iowa grown fodder varieties.

We have seed corn adapted to all sections of Michigan of varieties that will give big returns for the slight increase cost of seed.

Farm Bureau Brand certified Robust Beans are the highest yielding white beans in Michigan and Highly resistant to disease.

Farm Bureau Brand Soy Beans, Black Eyebrow, Ito San and Mid West are excellent for an emergency crop, for ensilage, hogging-off with corn, and for green manure.

This spring purchase seed certified as to orgin, purity and adaptibility and you know your money time and labor will be invested not spent.

Buy Farm Bureau Brand Seeds of known value through your LOCAL CO-OPERATIVE. If they cannot supply you write direct to the

Collision Coverage

NEARLY two-thirds of the entire number of claims paid in 1922 were collision claims, yet a great many members, either through oversight of misunderstanding, are still driving their cars without this protection.

Collision insurance is written in two forms, collision with moving traffic objects, including street cars and railroad trains, and accidental collisions with all objects either moving or stationary.

Compare our rates with the old line rates where the collision rate on a Buick car in the country district is $132.00 per year and in cities of the size of Bay City and Battle Creek it is $151.00 per year. Our collision rate is reasonable and yet affords good protection. Talk with your local agent about your collision insurance.

The Children's Hour

DEAR Nieces and Nephews: So many of you have written to me asking that I hold another contest, that I have decided to do so. This contest is to be different than any we have held so far and I hope all of you find it very interesting.

I wish to know which is the most interesting article or department in this issue of the Business Farmer, so here is an opportunity to help me decide and at the same time compete for a prize. Read this issue very carefully, pick out the article or department that you believe will prove of greatest interest to our readers and then write me a letter telling which article or department is your choice and why you think readers will like it the best. You can have your father or mother help you. Make your choice and you can discuss with them why it is most interesting if you desire, but you must compose your own letter. It would not be fair for you to have someone help compose your letter because then it would not be your own letter and even though it was the best of all received you would not be entitled to the prize. The contest closes Saturday, April 14th, and all letters received between the time you receive this paper and noon, Saturday, April 14, will be elegible for the prize providing they are of your own composition.

The prize—well, it is another "mystery prize" and even the winner will not know what it is until he or she receives it. If a girl wins she will receive something she will prize highly and if a boy is the lucky one he will win something he will enjoy very much. Don't you think it is more fun to work for a prize when you do not know what it is? I do. There are two things you wish to learn then—whether you won and what there was to be won. The prize I am offering is well worth working for and I hope you will all try and make this contest the best we have held. If you do we will have some more contests soon.—UNCLE NED.

OUR BOYS AND GIRLS

Dear Uncle Ned: May I join your merry circle? I am ten years old and in the fifth grade at school. I have three sisters and two brothers. One of my sisters was taken sick in school Monday and came home. There are twenty-one scholars in our school. I have seven studies. My birthday is the 18th of June. We have no woods. I have been learning to skate this winter. I wish some of the girls would write to me. Your niece, Lila E. Baker, Osseo, Mich.

Dear Uncle Ned and Cousins: Hello everybody. May I write to your merry circle? I wrote about a year ago. I live on an 80 acre farm. We raise mostly fruit, such as peaches, cherries, apples, a few plums and pears and we also have a little raspberry patch. I am in the 8th grade, and I am 13 years old. My birthday is the 1st day of January. I have two brothers and one sister. I weight 98 lbs. I was reading the letters in the Business Farmer last night and I happened to see that riddle by L. D. Biddle: a three cornered square, black as a bear, guess this riddle or I will pull out your hair. Answer: an old fashioned flat iron. I will close with a riddle and the one that guesses it right I will send a card to. Twelve pairs hanging high. Twelve knights came riding by. Each took a pair, yet it left 11 hanging there. I wish some of my cousins would write to me. I will answer all letters I receive. Bernice Mauer, Beulah, Mich., Box 156, K. & W. Orchards.

Dear Uncle Ned: This is the first time I have written. We have 250 pure bred Barred Rock hens. We live on a 50-acre farm. I have two brothers. The oldest is 12 years old and the other is 3 years old. I have no sisters. I am in the fifth grade at school and I have to walk one mile and a quarter. My father takes the Business Farmer and I like to read the Children's Hour. I will close with some riddles: Why is a airplane like a policeman? Ans.: Because he takes people up. Why is Sunday the strongest day? Ans.: Because all the others are week (weak) days. To what island should hungry people go? Ans.: The Sandwich Island. What tree is nearest to the sea? Ans.: The beach. I think I have written enough and will close.—Frances Marten, St. Louis, Michigan, Route 1, Box 6.

Dear Uncle Ned: I have been a silent reader of the Business Farmer and I thought I would write. I am a girl fifteen years old, March ninth. Have I a twin? I am five feet tall and weigh 100 pounds. I have long brown hair, I live one-half mile west of town on a one hundred and sixty acre farm. Do you like the farm? Well I do. Of course, I like to have a change once in a while but back to the farm I go. The grammar room and high entertain each other. The grammar room gave it last Friday and it was good. It was composed of two dialogues and a piece and songs. The junior class entertains this coming Friday. How many cousins like to skate? I like to skate, I think it is fun. I can roller skate too. The best ice we have had this winter was a week ago, but it has disappeared. Will some of the boys and girls write, I will try and anuswer all letters. I like to write them and receive them. Your niece. —Mable V. Robarts, Owendale, Mich., Box 6.

Dear Uncle Ned: May I join your merry circle? I am in the eighth grade at school and thirteen years old. I am in the calf club. I have a Jersey calf. We have seven head of Jerseys. I won first in the judging contest in Hillsdale County. I have four sisters and one brother. We had two or three days of summer last week and today is a regular blizzard. We take the Business Farmer and I like to read the Children's Hour. I like to ride down hill and skate on a large pond and play pomp-pomp-pullway. I go to the east Maple Grove school just across the road from our place. The answer to the riddle that L. D. Biddle wrote, three corners square, black as a bear, guess this riddle or I'll pull your hair, is a flatiron. My sister is going to write too.—Frank Baker, Osseo, Mich.

WINNERS IN "B" CONTEST FINALLY ANNOUNCED!

REGULATIONS which required that the master list be selected from contestants findings in the picture itself and the winning lists be based on the average, made a much longer job of correcting and auditing the lists of objects than was required in the "S" contest last year.

The Business Farmer appreciated how anxious were the contestants to know the final outcome and we take this opportunity of thanking all those who participated for their patience.

What Co-operative Associations Are Planning to Do to Prevent Potato Landslide

(Continued from Page 4)

and disasterous year in the potato marketing business. Our freights have gone up, and the indications are that they will go still higher. That restricts our market when seven states are competing, one with the other."

It was suggested that if 15 per cent of the crop could have been kept out of the market the balance could have been handled profitably. The meeting was asked to consider whether it is possible to get together on a regional basis and work out some method of co-operatively handling the crop, and marketing on the basis of quality and guaranteed contracts between the grower and the sales organization.

North Dakota Having Its Troubles

Mr. Gorden Randlett stated that the potato industry has grown during the past few years in North Dakota because of the educational campaign put on by the Agricultural College, Farmers' Institute forces, Farm Bureäu and other organized effort with the effect that the potato acreage has increased from year to year with the consequence that North Dakota took its share of the grief.

This grief was brought about, not only by the glutted market, but partly by car shortage, improperly fitted product and also because of a system of buyers and commission agencies that haven't always done the square thing by the people with whom they deal. He suggested an educational campaign among growers to the effect that in case of over-production, 15 or 20 per cent of the crop should be held back on the farm and fed to stock and only the best 80 or 85 per cent shipped to market.

Minnesota's Experiences

Mr. Dunton, manager of the Minnesota Potato Exchange said: "I think we are all agreed that the big trouble this year is the result of over-production." He stated that one of the factors that seriously effects the problem is lack of quality. There is not only poor production quality, but inefficient local grading brings about results as shown in the following table:

Report from State Inspection, Minneapolis office.

1922	Cars Inspected	Cars U. S. No. 1
Aug.	35	1
Sept.	123	56
Oct.	461	190
Nov.	247	125
Dec.	45	27
1923		
Jan.	23	17

"One of the great faults of the present system is consigning cars unsold. The presence of 50 or more cars of potatoes in Chicago unsold and bidding for a market is one of the strongest factors in reducing the price.

"The unrealibility of the dealers is another factor that must be overcome. We haven't developed in this territory a satisfactory marketing system. I believe that the solution lies in creating large supplies of standard potatoes in the hands of a few strong organizations. The solution of the problem for any one state is impossible. Mr. Wells, the manager of the Michigan Exchange, stated that Michigan had gone as far as it was possible until the other states were organized. Michigan has a very strong organization; they have facilities for storage that will enable them to hold back their entire crop until conditions are favorable, and yet, last season 1,000 cars moved from Minnesota, South Dakota and nearby territory into the markets and broke the market, not only for Michigan, but for the entire west."

Mr. Dunton stated that Minnesota's largest problem right now is proper warehouseing. To this end he favors the organizing of two associations, a marketing association and a warehouse corporation. The associations for purely marketing purposes; where warehouses are needed they are organizing warehouse corporations. These are financed by the issuance of common stock to the growers and preferred stock to others, the common stock to eventually retire the preferred stock as business increases so that the warehouses will, in time, become the property of the growers.

South Dakota has also been seeing her share of woe. When she organized her association two years ago her great idea was to get all the growers possible to market thru the association. She sent out live men to organize the growers and they signed up about 60 per cent of the acreage in a little over a month's time. Result, that potatoes poured into the market and the first six days saw the association with 600 cars on track, unsold. This year the association has learned a few things. It handled fewer cars of better stuff and consigned no cars unsold.

The conference lasted all day; the committees on production, grading and transportation reported and their findings were turned over to the committee on organization, which becomes the permanent interstate committee. It cousists of A. M. Dunton, manager of Minnesota Potato Exchange; Gordon Randlett, Director North Dakota Agricultural College; Mr. Foster, Wisconsin Potato Growers' Association; J. J. Martin, manager South Dakota Potato Exchange; Mr. Wilson, Potato Association, Montana and Mr. Wells, manager Michigan Potato Exchange.

Meetings will be called in each state to discuss the reports of this meeting with the view of forming plans for state organizations along the same lines and that may be federated if so desired at some future time.

QUESTIONS ANSWERED

TANNING DEER SKINS

Will you kindly send me a receipt for tanning deer hides into soft buck skin leather.—E. J. S., Winegar.

—The skins should first be unhaired. This may be done in various ways, the simplest, however, is to soak in clear water until the hair slips. A tub of lukewarm water kept in a warm room will help this along.

When the hair and "grain" or epidermis can be readily scraped off, put the skin on the beam hair down and flesh it well, then turn it over and scrape off all hair and epidermis (loose outer hide). A steel tool, with a square edge, is best for this. A skate blade answers very well. If you perfer, the graining may be done before the fleshing.

Next dissolve a half bar of laundry soap in two gallons of warm water. While still warm put the skin in and work the suds well into it. Let it stand about twenty-four hours, take it out, wring and pull it dry. Keep working — pulling and wringing while drying—for the working has much to do with making the tanned pelt SOFT. Give it a coat of oil dressing of some kind, butter or grease will do, warm the water, add another half bar of soap and put in again. After twenty-four hours more take it out and pull and stretch as it dries. The more you pull and work with the pelt while drying the SOFTER it will be. A very thick skin may require a third soaking in the warm suds (and a third pulling and wringing) but twice should answer for does and young bucks.

When dry and soft, skins should be smoked with a punky or dozy hardwood fire; this should give them a nice yellow tinge, much better than can be done rubbing ochre into the buckskin, as is sometimes done.

AN EASTER HYMN

By Thomas Blackburn

AWAKE, thou wintry earth,
Fling off thy sadness,
Fair, vernal flowers, laugh forth
Your ancient gladness,
Christ is risen.

Wave, woods, your blossoms all,
Grim Death is dead,
Ye weeping, funeral trees,
Lift up your head,
Christ is risen.

Come, see, the graves are green;
It is light; let us go
Where our loved ones rest
In hope below,
Christ is risen.

All is fresh and new,
Full of Spring and light;
Wintry heart, why wear'st the hue
Of sleep and night?
Christ is risen.

Leave thy cares beneath,
Leave thy worldly love,
Begin the better life
With God above,
Christ is risen.

SPRINGTIME

DEAR Folks:—Springtime brings with it all the feeling of wanting to stretch ourselves and embrace the big outdoors, to see all the wonderful things coming into life and hear our birds busying themselves with building their new homes.

Our animal friends teach us a great lesson in the spring of cleaning house and freshening up their abode. All the things about us take on new life and seem to tell us to get busy. A new season is here and we must be up and to our task.

So let us take an inventory of our own and start this week with our own house-cleaning and fixing things up, both inside and out. I know it will bring with it a great deal of satisfaction and happiness in our minds. One of woman's chief problems is house-cleaning and all the wonders of going thru drawers and boxes getting out last summer's clothes and putting away the winter ones so that the moths and other pests will not destroy them before they are needed again.

Some feel house-cleaning a chore, but after one gets into the work and sees the wonderful results gained, not only in having the house-in-order, but that wonderful peace of mind that comes to us all when a job is well done.

Why not let us try this spring and have the outside of the house made attractive. You do not have to look with envy upon the town woman and think she is the only one that can have an attractive front-yard. Why not let us have John fix a fence or an enclosed place to let the chickens run in, instead of letting them roost on our front porches, and decorate our front yards. Why not have the children take an interest in keeping the animals in the back of the house.

Let us try this spring to see how attractive we can make the front of our houses, with a few shrubs and flowers. If you cannot afford to buy seed or special shrubs and flowers, I might suggest the woods flowers. They have a lovely charm all their own and will make very attractive rows or beds. The little labor put on these few things pays for itself in the happiness that almost amounts to pride. You will enjoy sitting there to do your sewing and rest when the day is done.

SUMMARY OF WHAT SHOULD BE DONE CLEAN-UP WEEK

CLEAN-UP week should be preceeded by a health sermon in all the churches and the Monday following should be give as a school holiday in order that the children may help in the home and community clean-up work.

Following is a general summary of what should be done:

1. Move out all rubbish, salvage what may be useful and burn the remainer; move, dust and clean well all pictures, furniture, drapery, carpeting, bedding, clothing, cooking utensils, and all the furnishings of the house into the open air and sun them all day. If the day set aside for cleaning is cloudy or rainy, use the next bright day.

2. Brush down walls and ceiling of all rooms; scrub and clean thorougly all floors and woodwork. Strong lye and hot water may be used on rough floors, but only hot water and good soap should be applied to painted or finished floors and furniture. Do not use lye water on anything that is painted. Now is the time also to paint, paper or whitewash such inside walls, ceilings and woodwark as need attention.

3. Clean front and back yards, scrape off surface dirt, level and mend walkways, and attend to hedges, flowers and shrubs. Clean barns, hen houses and pig pens, and remove all accumulations of manure.

4. The water supply should be carefully inspected to see that surface filth cannot get into it.

5. Sanitary privies and water closets should be installed or rerpaired and made fly-proof.

6. Make all needed repairs to house, out-buildings and fences. See that screens are tight, and free from holes. Be sure to use plenty of paint or whitewash. In whitewashing use plenty of good lime, and, to keep the whitewash from rubbing off add one quart of salt to each five gallons of whitewash.

The Farm Home
A Department for the Women

Edited by MRS. ANNIE TAYLOR

A NEW service department for women will be made possible thru these columns. Any questions will be answered to the best of my ability. I will gladly advise you on any problems regarding your home or personal affairs. I will gladly purchase for you any articles you might find if difficult to obtain in your own vicinity. Detroit has most everything and it could be sent to you C. O. D. Maybe you would like to match up something either in thread or material. I want you to feel free to write me anything you might have on your mind and know that it will be taken care of at once. We will call it "Personal Shopping Service Bureau."

CASH PRIZES FOR SIMPLE GARDEN LETTERS

In our next issue I am planning to devote this page to the garden and making our front yard more beautiful. Prizes will be given for the best suggestions which incur little or no expense. $2.00 for the best letter, and $1.00 for the next best letter. The next three best letters will receive a year's subscription to the Business Farmer.

Your Friend,
Mrs Annie Taylor

Address letters: Mrs. Annie Taylor, care The Business Farmer, Mt. Clemens

SLIP-ONS REVIVE OLD FURNITURE

TO get a change or an appearance of newness to your furniture, try the slip-on scheme. There is no limit to what these slip-ons will do for a room and you will also come to love your furniture.

New fashioned, sprightly slip-ons for furniture are made from crinkly chintz.

Very often the furniture becomes worn or shabby and the owner doesn't wish to invest in a complete new set. Here the slip-ons serve their purpose.

Just lay the material on the piece of furniture and cut exactly the same size. Cut the back length six inches longer and three inches wider than the back of the chair, if you wish to make your own slip-ons. In the same way cut the seat pieces. Keep the cretonne straight and let any large figure design come squarely in the middle of the back or seat. Extra pieces can be cut for the arm pieces and up over the back, giving the appearance or effect of an applied banding. The bottom may be straight or plaited. If cretonne is not available or used, awning or crash will do, but are not adaptable for plaiting.

WALLS AND COVERING

IT IS best to remove any old paper and if one does not want to paper with regular wall paper, butchers' or building paper can be put on with narrow strips, making a clean, nice wall. Where there has been no paper and the house is not lathed and plastered, beaverboard can be put on by some home folks. If you have good plaster foundation, the cold water colored mixture can be easily applied and stenciled. I rather like this finish as it is easy to apply and by getting a good quality it will not rub off and can be obtained in soft tones. Below are a few suggestions in color and design.

North exposure and rooms that seem cold and dark need warm colors—Yellow, orange and red.

If the room is small, light color makes it appear larger.

Dark colors are advancing colors, making large rooms look smaller.

Southern or western exposures require cool colors—Blue, violet, green.

Stripes make room appear higher.

Bright colors make one restless.

Red paper often causes headaches.

If one has several good pictures and wants them to stand out, it is best not to use patterned paper unless indistinct in design.

Be sure to choose colors that harmonize with rugs and furniture.

PUTTING WINTER CLOTHES AWAY

The winter clothes will look better and be worth more for wear next winter if they are cleaned, brushed and mended before being put away for the summer. Moths thrive best in soiled clothes, and it is most embarrassing to take out the winter suit or overcoat some frosty day in November and find it full of lacy little holes where the moths have been living in comfort all summer.

Mothers Problems

THE CHILD AT THE PENCIL-MARKING STAGE

A FRIEND made the remark to me when my first little boy was approaching two years: "He's just getting to the pencil-marking stage, isn't he? I suppose soon your books and your pictures, your paint and your wallpaper will bear his first scrawls." I was horrified at the thought. I saw no reason why they should be, and now, though the home has four little children, the paper. the paint, the books and the pictures remain undesecrated by pencil-markings.

Whether pencil-markings shall be everywhere in evidence rests entirely with you. Every normal little child finds pleasure in using a pencil. It is to him a delightful sensation when he finds that there is a result from merely moving the slender object in his hand on paper. Naturally he desires to make those funny lines, once he has discovered how. If, at that stage, he is not taken in hand and his efforts guided, pencil-markings will appear all over the house.

The mother who understands will not take the pencil away from the child, and forbid him to have one again. Instead she will provide him with a piece of paper "like Mama writes on" for his scribblings. When that piece is used up, she will provide another piece until the cravings to make marks has been satisfied.

Little children understand much more than they are oftentimes given credit for. If a mother will repeat when the baby wants to use the pencil he has picked up, "Mama give baby paper; baby make pencil go on paper; baby write on paper," she will be surprised to see how quickly the child grasps the idea, and how soon. when he desires to make marks, he will run and get a piece of paper.

Persistence and patience a mother must have. One lesson will not teach a little child. The lessons must be continued over a considerable period. The mother must be continually on the lookout. "Mama doesn't write on pretty books. See. book is all clean. Mama write on paper; Baby write on paper, too." And Baby will understand.

There really is no excuse for books and walls to be spoiled by the child and his pencil.—Margaret Bartlett.

EASTER DINNER IN YOUR HOME

EASTER is here and with it all the glory of happiness that comes to us on this particular Sunday. Why not help celebrate it with a suggestion of the day in our menu and have our table take on a different look. If it is possible have some flowers or even a little green of some kind in the center with a touch of yellow or purple ribbon. Let us have a meal in keeping with the day. The following is a very simple one and if not heavy enough any good meat will balance it. I have planned a menu with this in mind:

Oranges
Purple Jelly
Creamed Eggs on Toast
French Fried Potatoes
Buttered Asparagus in Lemon Rings
Twin Mountain Muffins Grape Ice
Washington Pie

Serve halves of large oranges with a little whipped cream colored purple in the center of each. Put a rather thick white sauce on buttered toast and on this place halves or quarters of hard cooked eggs. The yellower the yolks the prettier the effect.

Draw asparagus stalks or string beans which have been heated and seasoned through rings of lemon skins.

The twin mountain muffins are yellow. Cornmeal muffins are also.

Grape Ice: 4 c water, 2 c sugar, 2 c grape juice, juice 2 lemons, 1-2 oz. citron cut very fine (if desired).

Make a syrup of the water and sugar and boil for 10 minutes. Cool. Add the other ingredients and freeze.

If grape jelly is used instead of grape juice melt the jelly, add to the syrup and use less sugar. Determine this by the taste.

Washington Pie: 1-2 c fat, 1 c sugar, 2 eggs, 1-2 c milk, 1 3-4 c flour, 1-2 tps. salt, 2 1-2 tps. baking powder, 1-2 tps. vanilla or 1-4 tps. lemon extract.

Cream the fat, add the sugar gradually, then the eggs well beaten. Add the milk alternately with the mixed and sifted dry ingredients, then the flavoring. Bake in two layers in round tins.

Spread cream filling between the layers and over the top.

Cream Filling: 7-8 c (14 tbs.) sugar, 1-3 c flour, 1-8 tps. salt, 2 eggs, 1 tps. vanilla, 1-2 tps. lemon extract.

Mix the dry ingredients, add the eggs slightly beaten and pour on gradually the scalded milk. Cook 15 minutes in a double boiler, stirring constantly until thick, then occasionally. Cool and add the flavoring.

In the filling on the top arrange a circle or other design of purple cherries.

Hot Cross Buns

Hot cross buns, of course, are especially for Good Friday. In olden times, if eaten before any other feed on Good Friday morning, they were supposed to ward off witches, cure internal diseases and to protect dwellings from fire. They now have lost much of this legendary significance, yet they are still considered a delicacy of the Good Friday menu. Although properly belonging to Good Friday there is no reason why they may not be served on Easter if one wishes to do so. I give the recipe:

Hot Cross Buns: 1-4 c sugar, 2 tbs. fat, 1-2 tps. salt, 1 c scalded milk, 1-2 yeast cake disolved in 1-4 c lukewarm water, 3-4 tps. cinnamon, 3 c flour, 1 egg, 1-4 c raisins or currants.

Add the fat, sugar and salt to the milk. When lukewarm add the softened yeast cake, the flour and cinnamon gradually and the egg well beaten. When thoroughly mixed add the fruit. If raisins are used cut them in pieces. Cover and let raise over night.

In the morning shape in round biscuits, place in a pan, let rise, brush over with beaten egg. Bake twenty minutes, cool and with ornamental frosting make a cross on top of each bun.

Personal Column

Pomace stone to rub the rust off from needles and the sharpen needles is fine just rub them on a piece of stone.—J. D.

One way to save washing and ironing, make the best parts of old tablecloths into towel shaped strips and place across the ends and sides of the table. They can be changed often and are a good deal easier to wash and iron than a table cloth.—J. D.

We hear a lot of talk sometimes about women not having the meals on time, but very little is said about the men not being on time for their meals. The last is just as much of a nuisance as the first.—J. D.

We have the poem, "Briar-Rose" and find it too long to print in the paper, but will be glad to send it by mail if the reader who asked for it will send me her name and address.

Keep Away Moths

Apply gasoline with a sponge or brush to your carpets to keep the moths away.

Makes Furniture Shine

Old pieces of velvet or velveteen should be saved and used for polishing furniture.

What Will Remove Liniment Stain?

I have a large yellow stain on one of my best pillow slips, caused by a bottle of Turkish liniment tipping over on it and it seeped out through the cork. I have tried several things such as lemon juice, butter, sweet cream, etc., but nothing seems to do any good. I do not know anything about what the liniment contains as it does not tell on the bottle. It is oily and is or was put up at Portland, Mich. The label was dated 1906. Can anyone tell me something that will remove it?—Mrs. A. D.

—Has anyone ever had this trouble? Write me and let us help Mrs. A. D.

For Mrs. C. C.

We are indebted to Mrs. E. S. for the following information on cleaning feather pillows, requested by Mrs. C. C. a few days ago. Mrs. E. S. says to take a large clear pollow slip, open one end and pour the feathers into this bag. Then to make a suds of soap flakes using three parts flakes to one of borax. Wash in three waters and then rinse in clean warm water. When rinsed thoroughly hang bag on the line on a bright sunny day; fluff it often with the hands then take into the house to dry.

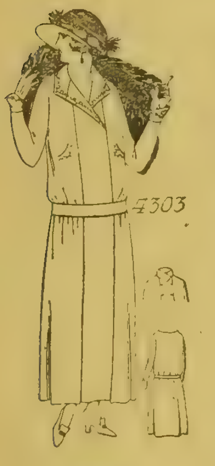
Mrs. S. H. S. sends in directions for cleaning as follows: Remove from cases to cheese cloth bag and allow feathers to hang in sunlight for two days or more. Wash ticking, then return feathers, she says.

—if you are well bred!

—You will never open another's letters.

—you will not enter the room of any member of the family without first knocking.

AIDS TO GOOD DRESSING



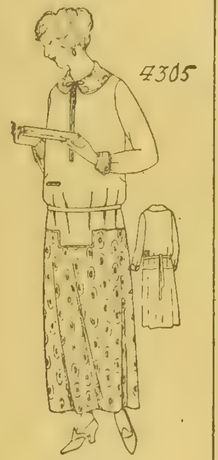
4303

EFFECT OF LINES IN DRESS

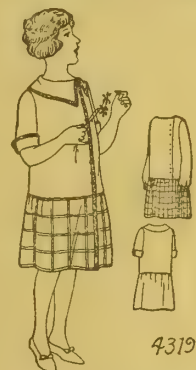
1. Perpendicular lines seem to increase the height of an individual and may be introduced into the costume by panels, plaits, rows of buttons, tucks or braid, etc.

2. Horizontal lines seem to increase the width of an individual and may be introduced into the costume by ruffles, tucks, braid, etc.

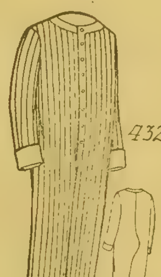
3. The more nearly a curved line approaches a straight line the more beautiful it becomes. An individual with very ample curves may straighten her curves by not drawing her dress in too tightly at the waist line.



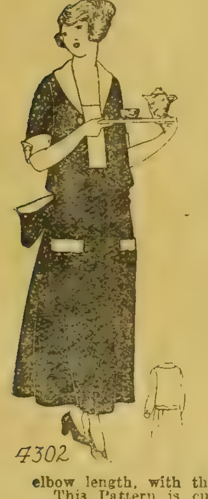
4305



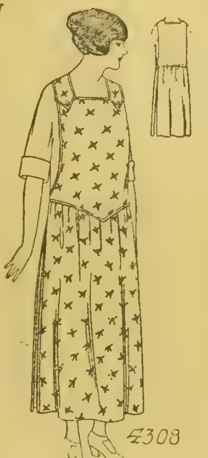
4319



4329



4302



4308

A Stylish Dress in One Piece Style

4303. Taffeta, satin, serge or linen could be used for this model. The vest portions are crossed in double breasted style. The collar may be rolled high, or turned low.

The Pattern is cut in 3 Sizes: 16, 18 and 20 years. An 18 year size requires 5¼ yards of 40 inch material. The width at the foot is 2¾ yards, with plaits extended.

Simplicity and Good Taste Combined

4305. Here is a model that has attractive features, and is withal comfortable. Figured and plain crepe, or the same combination in voile or foulard, or linen and gingham could be used for this style.

The Pattern is cut in 3 Sizes: 16, 18 and 20 years. To make this style for an 18 year size will require 4¾ yards of 32 inch material. The width at the foot is 2¼ yards. To make the waist and sleeves of contrasting material requires 2⅛ yards of 32 inches wide.

A Simple Pretty School Frock

4319. Plaid or checked Gingham could be combined with chambrey or linine for this style. The collar may be omitted. The sleeve may be finished in wrist length with a band cuff, or in elbow length, with the shaped cuff illustrated The dress closes at the side.

This Pattern is cut in 4 Sizes: 6, 8, 10 and 12 years. A 10 year size requires 1⅞ yard of 36 inch material for the waist and 1⅛ yard contrasting material for the skirt. To make of one material will require 3 yards of 36 inch material.

A Comfortable Sleeping Garment

4329. Madras, cambric, silk or flannellette, could be used for this style. It is finished with centre back and leg seams. The cuff may be omitted.

The Pattern is cut in 4 Sizes for Boys: 10, 12, 14 and 16 years, and in 3 Sizes for Men: Medium, 38-40, Large, 42-44; Extra Large, 46-48 inches breast measure. To make the garment for a Medium size requires 4¾ yards of 36 inch material.

A Very Attractive House Frock

4302. Blue or black sateen with white dots, and with trimming of white linine, would be pleasing for this style. It is also nice for percale and gingham.

The Pattern is cut in 7 Sizes: 34, 36, 38, 40, 42, 44, and 46 inches bust measure. A 38 inch size requires 5 yards of 40 inch material. To trim as illustrated will require ⅞ yard of 32 inch material. The width at the foot is 2½ yards.

A Comfortable Apron Model

4308. This style should appeal especially to women of mature figure. The apron may be finished to close at the shoulders, or sides or to be slipped over the head. It is easy to make and easy to launder. The style is good for percale or gingham, also for other apron fabrics.

The Pattern is cut in 4 Sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A Medium size requires 3½ yards of 36 inch material.

Cured Her Rheumatism
Knowing from terrible experience the suffering caused by rheumatism, Mrs. J. E. Hurst, who lives at 608 E. Douglas Street, C-489, Bloomington, Ill., is so thankful at having cured herself that out of pure gratitude she is anxious to tell all other sufferers just how to get rid of their torture by a simple way at home.
Mrs. Hurst has nothing to sell. Merely mail your own name and address, and she will gladly send you this valuable information entirely free. Write her at once before you forget.

Cleared Up Bad Abortion

Don't give up the abortive cow as lost until you have given Kow-Kare a chance. We receive yearly hundreds of letters telling of complete recoveries through the use of Kow-Kare. Here is one from Joseph E. Frank, East Earle, Pa:

"Early in the spring I had a cow that was affected with Abortion which had taken a bad start, so I sent for a veterinary but the cow kept getting worse and did not eat hardly anything for two weeks and the doctor said she would die as she was so weak she could not stand up any more and he could do nothing for her so I went and got a box of Kow-Kare and gave it according to directions and in three days she was on her feet and eating real good. Today she is as good a cow as you can find. So I must say that Kow-Kare saved her and will others just the same, as this was a very bad case when I started."

Not all abortion is curable, but usually it is the result of a badly run down condition of the genital organs. It is these organs and the digestive functions that Kow-Kare rebuilds. Its medicinal aid is without an equal in the treatment of Barrenness, Retained Afterbirth, Scouring, Bunches, Milk Fever, Loss of Appetite—all of them resulting from impairment of the genital and digestive functions.

No cow should go through calf-birt without the support of Kow-Kare. A tablespoonful twice a day for two weeks before and after will accomplish wonderful results.

Send for free book "The Home Cow Doctor." This fine 32 page treatise will give you scores of money-making and money-saving tips on the care of cows.

You can find Kow-Kare at general stores, feed stores and druggists. If your dealer is not supplied, we mail, postpaid, on receipt of price.

O. I. C. BIG TYPE GILTS FARROWED MAY 15th, 22 weighing 300 lbs. Bred to Leighty Monster an outstanding boar. We have been [illegible] O. I. C.'s for 20 years.
NEWMAN'S STOCK FARM, Marlette, Michigan.

DAIRY and LIVESTOCK

ALEXANDER & BODIMER SALE WONDERFUL SUCCESS

ONE of the most successful livestock sales of the season was that of Alexander & Bodimer, at Vassar, on March 8th, where they sold 40 head of registered Chester White swine consisting of 36 bred gilts and one open gilt, two tried sows and one yearling boar.

The sale was held in a heated sale barn on the Alexander farm and the day was a fine one and there was a large crowd of buyers gathered from all parts of the state and other states as well, bidders being present from Illinois, Indiana, Ohio and Pennsylvania. The sale went with a bang right from the start and brought an average of nearly $62.00 per head.

No. 33 topped the scale going to Wilbur Jones of Reese, Mich., at $177.50. She was an open gilt sired by Alexander & Bodimer's great herd boar "The Monster" and from their champion sow "Long Beauty." She is certainly a splendid animal with great size for her age and as smooth as a ribbon. Besides Mr. Jones, Thomas Hile of Caro and the Detroit Creamery Co. Farms of Mt. Clemens were the opposing bidder. Detroit Creamery Co. Farms bought the tops of the bred gilts, Nos. 7 & 8, at $105 and $110 respectively. The whole offering was in splendid condition and at the prices paid should prove profitable investments for the buyers. Col. H. T. Walker of Montpelier, Ind., assisted by Cols. MacEldowney of Caro and Atkins of Vassar sold the offering in a very able and pleasing manner. List of buyers follows:

No. 1, Otto Neu, $50.00; No. 2, Wm. Hall, Vassar, $62.50; No. 3, Albert Hall, Fairgrove, $50.00; No. 4, M. Culbert, Fairgrove, $47.50; No. 5, Claude Cole, Caro, $65.00; No. 6, Henry Lane, Fairgrove, $65.00; No. 7, Detroit Creamery Co., Mt. Clemens, $105.00; No. 8, Detroit Creamery Co., Mt. Clemens, $110.00; No. 9, Thomas Hile, Caro, $70.00; No. 10, Knox Youngs, Reese, 65.00; No. 11, Clara V. Dorman, Snover, $50.00; No. 12, (boar) Thomas Hile, $75.00; No. 13, Crapo Farm, Swartz Creek, $45.00; No. 14, Roy Gardner, Fairgrove, $45.00; No. 15, C. Sodolski, Bay City, $55.00; No. 16, Claude Cole, Caro, $47.50; No. 17, E. Hodges, Colemen, $52.50; No. 18, Roy Jackson, Caro, $55.00; No. 19, Norris Miller, Fairgrove, $50.00; No. 20, Robert Aherns, Fairgrove, $50:-00; No. 21, L. H. Ald, Reese, $62.50; No. 22, O. Wriggelsworth, Howell, $65.00; No. 23, Mr. Vanderlip, Lapeer, $52.50; No. 24, Wiley Kirk, Fairgrove, $62.50; No. 25, J. C. Kirk, Fairgrove, $57.50; No. 26, R. Hamnet, $50.00; No. 27, Henry Rogner, Reese, $45.00; No. 28, Bruce Brown, Mayville, $55.00; No. 29, Lute Jones, Lapeer, $52.50; No. 30, Thomas Hile, Caro, $70.00; No. 31, John Howell, Ovid, $52.50; No. 32, Irvin Cross, Colling, $67.50; No. 33, Wilbur Jones, Reese, $177.50; No. 34, Findlay Bros., Vassar, $65.-00; No. 35, S. E. Lawrence, Britton, $62.50; No. 36, A. Gremmel, Sebewaing, $40.00; No. 37, A. Davis, Lapeer, $47.50; No. 38, J. Richards, Reese, $47.50; No. 39, N. J. Neal, Bay City, $52.50; No. 40, Crapo Farm, Swartz Creek, $50.00.

SPRINGTIME FOR HOLSTEIN BREEDERS

SPRING is a time of quickening life, and breeders of Holsteins in Michigan are acting springy. Five County Associations met within four days recently. The State Holstein field man, J. G. Hays, was called upon to attend these gatherings and to explain the extension program of the National Holstein Association, and to indicate how the county units should organize to get results from the Extension Service.

Monroe county started the fireworks with a meeting the 14th. The main interest in Monroe seems to lie along the lines of Cow Test Ass'n. work. Guy Doty, of Monroe, was elected as Cow Test Ass'n. deputy. E. L. Smith, of Adrian, president of the State Holstein Ass'n., was present and talked State Holstein policies to the breeders.

The second meeting took place the 15th in Lenawee county. Lenawee has been actively organized for several years, boosting different projects. At their gathering calf club work held the center of the stage. Earl Holmes of Clayton is the county calf club deputy.

The night of the 15th found the Wastenaw county breeders gathered for a banquet at the Huron Hotel at Ypsilanti. This was mainly a social affair—with a little fancy dancing by local talent to add to the good time. After the feed a short business session was held in which O. J. Feldkamp, of Saline, and Frank Geiger, of Rushton, were selected to assist Co. Agent Osler in pushing cow test work; and Jas. Sanderson was elected to work with Club Leader Watts in calf club work.

The following day the Livingston county ass'n. staged a meeting. The proportion of high class sires for the county held the main attraction here. J. E. Williams, dairy supt. for the Detroit Creamery Co. farms at Mt. Clemens, gave a talk regarding popular blood lines of the day, and told of his travels searching for an outstanding sire.

The week was ended with a meeting is Kent county. Advertising the breed and the Holsteins' milk occupied the breeders' attention. Members pledged their support to County Agent Vining in a project to locate several of the large "Bill-boards" in the county at strategic points.

Another sign of "Spring" in the Holstein business is the result of a couple of recent sales, on which prices showed a rising tendency.

Musolff Bros., of South Lyon held a sale March 10th, dispersing a herd of 54 head owned by the brothers on one of their farms. In this sale appeared many record animals, including four 30 lb. cows. Most of the offerings were either sired by or bred to King One Champion, King Petch Segic Lyons, or Maplecrest Application Pontiac. These sires represent good seven day and yearly records. Two cows brought the figure $610.00, one, Wabash Fayey 2nd, a showy five-year-old with 23.4 lbs. as a three year old and 689.25 from 16,601.9 milk in 10 months; the other a 28.66 lb. four year-old Johnna Korndyke Walker De Kol, her dam a 1,000-lb. cow.

The sale of H. T. Lewis at Elsie the 13th contained no large record stuff, except the herd sire, a two-year-old from a 1,000 lb. dam. He brought $300.00. However, the cattle were of good individuality, and the herd was fully accredited. The milking cows averaged $204.00 the young stuff, $137.00, and the calves $90.00.

The sale was topped by Inka Canary De Kol Aoggie, a 6 year old cow of great capacity and quality. She had no official record, but had milked over 100 lbs. a day on private test. She went to Colonel Shubel of Lansing for $540.00.

With cattle moving more freely, and at better prices in private and public sales and with breeders showing interest in organization it is apparent that the Holstein business is looking up in our state.—J. G. Hays, State Holstein Fieldman.

SCHAFFER BROTHERS' SALE

OUR first Annual Sale of Duroc-Jerseys was held March 13th, and thirty-seven head were disposed of at an average of $40.00. The top sale was $100.00 and several fine Gilts sold at from $60.00 to $65.00 and nearly all were taken by neighborhood farmers from Oakland and Macomb Counties and we hope that next year we will be able to take in a larger territory.

"Sensation Marsi," our herd boar is coming along fine and his two litters are real pigs, and we are now fitting him for County and State shows. We also have some very fine Sows, that we expect to show.

Mr. Walter Rice, formerly of Victoria, Ill., is now in charge of our herd and his many friends will be glad to know of his new location where he will be glad to hear from them.—F. J. Schaffer.

PRODUCING MILK TO SELL IN THE CITY

What are the state requirements in regard to the barns in which cattle are housed from which the milk is sold to people in a village? How much light must be allowed for each cow also is a plank floor with a drop sufficient? Has the state any objetion to horses being housed in the same barn? How far from the barn must the manure be carried? How must the milk be handled after it is milked, does there have to be a cement floor in the milk room where cooler is located? Do all milk utensils and bottles have to be steamed or can they be washed and kept clean with boiling water? What is the name of the state milk inspector?—W. H., Marcellus, Mich.

—This matter is not definitely covered by any regulations which we have. It is necessary under each individual case, to determine whether the milk is being produced properly or not. Definite requirements are, however, insisted upon by City Departments. We do consider inspection work, especially in places where city inspection is not carried out.

Barns in which cattle are kept should be reasonably tight so that dust, cobwebs, etc., are not prevalent in the stable. For a perfect score four square feet of light per cow is required. However, two square feet per cow is about the average. Objection is made to the keeping of horses with cattle when the horse stable is immediately adjacent to the cow stable. Many cities require a separate compartment for the cows. Manure should be carried at least 25 feet if possible from the cow stable, but no definite distance has been established.

A cement floor in milk rooms is practically required and if a cooler is used it should be located in a milk room free from dust, etc. Utensils may be either steamed or scalded. The inspecter who does most of this work for us is Mr. E. J. Friar.—H. H. Broughton, State Bureau of Dairying.

FEEDING VALUE OF SUDAN GRASS

I would like to ask what you think of Sudan grass for feed for horses and cattle? When should I put it in and what kind of ground does it grow best on?—R. C. A., Harbor Springs.

—Sudan grass has practically the same feeding value as timothy hay. It makes a fairly good emergency crop because the yield is good and the hay is secured the same season that the seed is sown.

Sudan grass is best adapted to good corn soil. It should be sown about the middle of May at the rate of from twenty to twenty-five pounds of seed per acre. An ordinary grain drill set to sow two pecks of wheat will sow approximately twenty-five pounds of Sudan grass seed. In the southern tier of counties two crops may sometimes be secured in one season, while in the central part of the state it is not likely that more than one crop will be secured.— C. R. Megee, Farm Crops Dept., M. A. C.

WRONG RATION

I am writing you in regard to my pigs. These pigs are about three months old. They look good, their hair is slick and in good growing condition. One day last week when I fed them two of them came up to get their meal and just touching the trough they would squeal and fall over on their sides and back and they would lie there for a while before they could get up, lingered along for two or three days and died. After these pigs died we opened them but could not find anything that looked wrong. These pigs have ground rye and corn together but mostly rye. The seven pigs weigh about fifty pounds each.—O. M., Mancelonia, Michigan.

—The trouble you are having with your pigs may possibly be due to worms, although from the symptoms which you describe, I would sooner think that it is due to the ration which you are feeding.

An excellent remedy for worms is the following: 2.5 grains of santonin, 1 dram Areca nut, .5 grains of calomel and 1 dram of sodium bicarbonate, for a 50 pound pig, given after the pig has been off feed 24 hours.

When purchased from a local druggist, this preparation is rather costly, but capsules or tablets containing any of these ingredients can be purchased from any reliable drug house and from most mail order houses.

Rations consisting of rye and corn are decidedly unsatisfactory for young growing pigs. These pigs are not getting nearly a sufficient amount of mineral matter, nor are they getting a sufficient amount of protein or muscle growing material. Furthermore, when rye is fed, pains should be taken to see that it does not contain much ergot, which may be easily recognized as kernels affected with this disease are black in color, elongated and crescent shaped.

Apparently rye is the cheapest feed which you have judging from the fact that you are feeding it in large quantities. I would advise that for these young pigs one-half of the ration in connection with rye should consists of wheat middlings and that for each 100 pounds of rye and middlings, you feed about 6 pounds of digester tankage. If skim milk was available, the tankage would not be necessary. In addition, these pigs should have access to some good mineral matter. We are using the following with our hogs this winter: 30 pounds finely ground lime stone, 30 pounds percipitated bone meal, 30 pounds salt, 10 pounds sulphur. They should also be given access to clover or alfalfa hay.—George A. Brown, Professor of Animal Husbandry, M. A. C.

VETERINARY DEPARTMENT

REMOVING CORNS

I have a horse that has corns on his front feet. What can be done to eradicate the corns?—T. F. K., Germfast, Michigan.

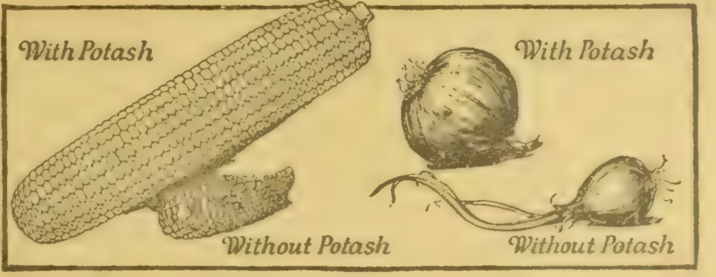
—The causes of corns are bad leg direction, poor quality of hoofs, injudicious dressing of the hoof such as leaving the toe too long, excessive weakening of the sole, bars, frog and the quarter are common causes. Hollowing the sole and unnecessary thinning of the branches of the sole in the search for corns is also a cause. Shortening one quarter too much in relation to the other so that the foot is unbalanced and the lower side is overloaded is a common cause. Shoes not level on the hoof surface, too short in the branches, and shoes whose bearing surface does not completely cover the hoof commonly causes corns. Allowing shoes to become loose and shifted in position is also a cause. Dryness is very injurious to hoofs and very favorable to the production of corns. Treatment consists in first removing the cause by restoring the proper form to the hoof by cutting down quarters that are too high, shortening a toe which is too long. Deeply digging out an area of blood stained horn is injurious. It is much better to thin the entire branch of the sole uniformly. The proper shoe is the bar shoe with some frog pressure unless the horse is suffering from side bone. The pressure should not be taken from the quarter walls unless they are sore. The care of the hoof consists in keeping it moderately moist and clean.—John P. Hutton, Asso. Prof. of Surg. and Medicine, M. A. C.

SECURE SERVICE OF VETERINARIAN

I have several cows I cannot get with calf, is there anything I can do?—A. V., Croswell, Mich.

—Failure to breed in most animals is due to disease of some part of the reproductive tract and is most effectively treated by local applications to the diseased part by one who has had some experience in treating diseases of the reproductive organs. The nature of this treatment is such that it cannot be applied by the layman. Some have recommended the oral administration of potassium iodide. This can act only as a tonic and is of questionable value. If a local veterinarian is available the best thing for you would be to have him make an examination of these cows and to determine if possible the exact nature of the trouble.—E. T. Hallman, Assoc. Prof. of Animal Path., M. A. C.

Farmers of the country buy 40 per cent of their food supplies, according to a survey of the United States Department of Agriculture. It is shown that about 9 per cent of the food consumed on farms can economically be produced locally, rather than being brought in from distant producing areas.



Potash for Swamp Land

DOES the corn grown on your swamp or muck land look like the large ear or like the small one? The small one shows the kind of corn produced on potash hungry muck land. When 100 to 200 lbs. per acre of German Muriate of Potash, or 400 to 800 lbs. of German Kainit, are broadcasted on potash hungry muck, full yields of sound corn are produced.

For onions, on such lands, 100 to 200 lbs. per acre of German Sulfate of Potash is the right amount to produce full yields of sound onions that ripen normally and keep well.

With potatoes and truck crops, like results are obtained.

Even at war prices potash gave a good profit on swamp lands. Today it is the cheapest plant food. Genuine German Potash will help you reduce the cost of production, and greatly improve the quantity and quality of your crops. There is plenty of it if you will take the trouble to insist on having it.

FARM MECHANICS

AMOUNT OF POWER AVAILABLE FROM STREAM

I have a small stream dammed and have it fixed so I could shut it off until I would have water enough that I think would give me lots of power. I want to put in an electric light plant which would supply me with twenty-five or thirty lights. Also want to have it fixed so I could get power that would equal a six or eight horse power gasoline engine. I would like to have all the information I could get along this line.—A. F, L., Curran, Mich.

—I may say that before the amount of power which is available from the stream can be determined it is necessary to know something of the flow.

If the stream is now flowing it is possible to measure its flow approximately by taking the average cross section of the stream and multiply this by the distance which it flows in a minute and the result by 8-10. For example, a stream 2 feet deep 6 feet wide flowing 100 feet per minute will discharge 1200x.8 or 960 cubic feet of water the volume of water multiplied by the fall which can be secured, say 5 feet, given in the example would be equal to 4800 cubic feet or since water weighs 62.5 lbs. per cubic foot the result would be 300,000 foot pounds per minute. Divide this by one horse power or 33,00 foot lbs., which would give a trifle more than 9 horse power. This amount of power would be the total or the theoretical amount in the stream. There would be, of course, considerable loss in any kind of wheel or turbin developing this power, and also there would be some loss in storage batteries, if these were used, so in a rough way it would not be safe to figure more than 50% of this amount or 4½ h. p. for available use.

If the flow of the stream was not sufficient to produce power continually it might be dammed and the flow used for a part of the day or during the time that lights or power is wanted. With this arrangement the storage of power consists in storing it in the stream rather than storage batteries, this scheme would not be very advantageous if the power was located at a great distance from the house or source wanted. Perhaps if the head of water did not exceed 6 or 7 feet the turbin would be the most satisfactory and efficient unit for developing power. The smallest turbin requires about 350 cubic feet of water per minute and a minumum fall of not less than about 4 or 5 feet. If the fall is more than 6 or 7 feet perhaps the water wheel would be satisfactory and less expensive to install.—J. H. Musselman, Prof. of Farm Mechanics, M. A. C.

TINNING SOLDERING IRON

Can you tell me exactly through your valuable paper how to tin a soldering iron?—J. W., Walkerville, Mich.

—The following instruction should be closely observed.

General Soldering Instructions

A flux is any cleansing material which will remove grease from and prevent the formation of oxides on materials to be soldered.

For bright tin or lead, rosin or tallow may be used as a flux. For rusty materials, iron, brass or copper, a zinc chloride flux is best. This can be prepared by putting a few chips of zinc into hydrochloric acid, gradually adding more until the bubbling has stopped allowing an excess of zinc to remain. The hydrogen gas coming off is explosive and should be kept away from flames. Galvanized iron or sheet zinc should be cleaned with dilute pure hydrochloric acid before being soldered.

Salamoniac is a white crystalline substance which is used for tinning soldering bits.

A lap or flat seam is one in which the plates simply lap over each other for about one-quarter inch and are soldered in place in this manner. This is not a very strong joint and should be used only with very thin material and for light work.

A lock seam is made by doubling over an edge of each sheet hooking the two together and pounding them shut. This makes a strong joint after it is soldered.

A bead seam is only used for joining very thick pieces of metal and is made by beveling the edges down to about an angle of 60 degrees each thus leaving a space of about 60 degrees to be filled with solder when the two edges are butted together.

A cup joint is used for soldering together lead pipes or light tubing. It is made by spreading the end of one pipe into a cup or funnel shape and shaving down the other to fit into it.

An overcast joint is used for soldering lead pipe to short nipples or couplings. It is made by spreading the pipe to fit over the nipple and then soldering a sort of a lump right over the joint.

Soft Soldering and Tinning

All the common metals become oxidized when exposed to the air especially when they are slightly heated. As solder will not adhere to a surface that is ever so slightly oxidized it is necessary to apply somthing to the surfaces to be soldered which will guard against this oxidation.

The object in tinning is to coat the metals to be slodered with tin or solder to prevent this oxidation. In order to transmit the heat rapidly from the soldering bit to the work it is necessary to have the solder in close contact with the bit with no intervening film of copper oxide or carbon. This is why soldering bits are tinned before putting them into use.

Tinning copper bit

The bit should be placed squarely into the flame or fire so that it becomes evenly heated. When it is hot enough to melt solder rapidly, (not red hot) file the bit bright on two adjacent sides to a distance of about 1½ inches from the point. Do this rapidly so that the bit does not become too cold. Next rub these sides on a bar of salamoniac to reduce the oxide which has already formed. Then pick up your solder and melt a few drops of it on to the salamoniac, rubbing the bit on the two together at the same time. You will now notice that the two filed sides have a bright coating of solder on them which enables the bit to pick up globules of solder. If at any time the bit becomes red hot the tinning will burn off and it will be necessary to retin it. Care should be taken therefore not to overheat the bit.

Tinning Materials to be Soldered

Bright tin, copper, brass, zinc and lead need not be tinned before soldering, but sheet iron and rusted metal should be carefully tinned so as to insure a strong joint. All paint, rust or soot should be removed by scraping, filing or sandpapering. Now apply zinc cloride flux freely, after which rub the brightened surface well with the hot bit at the same time applying the solder. It may be necessary to apply flux and solder several times before the article is properly tinned. The article is now ready to be soldered, just like bright tin, which is as follows: If the pieces which are to be joined are liable to beshifted or pulled apart it will first be necessary to "tack" them together. This is done by applying a few drops of solder at several places on the work. It will now be necessary to know only a few general principles to do good soldering.

(1) First of all have your work well fluxed but do not flux too large an area at a time.

(2) Have your bit well tinned and hot. If you solder with a bit that is not much hotter than the fusing point of solder you will not be able to get the solder to flow into the joint but will simply cover it with a thin film. This is called skin soldering and should be avoided because it makes a weak joint.

(3) Do not try to solder with the point of the bit, but use as much of the flat tinned surface as possible.

(4) If possible hold your work in such a position that the solder will flow in place by gravity, it only being necessary to follow with the bit so as to keep the work hot.

(5) Do not run the bit over a place that has once been soldered as this only tends to make rough appearing work.

(6) Never put your bit down on iron or stone as this rapidly withdraws the heat and wastes time. Put it back into the fire at every opportunity.

(7) When soldering heavy or thick articles, (say a pipe to an iron tank) it will be necessary to heat the work to nearly the melting point of solder.

(8) To solder a flat or lap seam it is best to first tin one of the edges to be joined and then lay the other edge on top of it. Solder should then be run right over the outside of the lap.

(9) In a lock seam care must be taken to have the solder run well into the seam.

(10) When using a bit to pick up solder do not take it directly from the bar of solder because this tends to heat up the entire bar and leaves the bit cold. Instead of this melt a few globules from the bar and pick these up as they are needed.

(11) Leaks in washboilers and pails, etc., should be soldered from the inside.—E. C. Sauve, Ass't Prof. of Farm Mechanics.

A thousand pounds of hens need 8,278 cubic feet of air a day, while a thousand pounds of horse uses up only 3,401 cu. ft. of air a day. Hens have to breathe at a furious pace to keep up their high body temperature. Give them air.

Poultry for Profit

EXPENSE IN REARING YOUNG CHICKS

THE embrayo chick finds all its parts in the white of the egg; the yoke is only its starting place and the last thing it does before breaking the shell is to surround the yolk, which becomes its food for the next three days, or longer if needs be. That is one of the reasons why the best time to ship away young chicks is within 24 hours after they are hatched. The chick's first great need is to be kept warm. In a state of nature the hen remains on her stolen nest unless driven off by hunger long after all the chicks have been hatched, and when one after another the chicks have come out from under her, picking at bright little pebbles and swallowing them for the millstones which are to grind their food, the hen calls them back under her, but the next time they stray further away, and then she goes with them to scratch and hunt for their food. From which we can learn that it is not necessary to feed little chicks the first 24 hours, and also that they should have fine grit to pick at when they are first fed food that needs any grinding; and there is not much fed to a chick that does not need grinding. If we, when eating, get a piece of stone between our teeth it sends a thrill of repulsion through us; but that sensation which is so unpleasant to us is delightful to a chick. Using clean sharp sand in a brooder, I have had chicks fill themselves full, crop and intestines, with the sand, probably because it felt good going down their little throats.

Careful Feeding

It is very unwise to overfeed young chicks; a little and often should be the rule. About three-hour intervals are considered right for a human baby, and like intervals during the first week would not be far wrong for young chicks. It is far better for them to be a little underfed than to be cloyed. After they are a week old a dry mash can be kept where they can help themselves. They will not overeat of that, for the reason that they cannot furnish saliva enough to moisten more than two or three mouthfuls, and dry they cannot swallow it. They also need some cracked grain, for that little grist mill, the gizzard, needs to work—wants a job. Water they must have, but so arranged that the chick cannot get in it. A very cheap drinking fountain is made by taking a quart tomato can, denting in the sides at the top, filling with water putting on the cover, then turning it bottom up. The chick can stick its beak into the cover where the indentations are, but cannot get in itself. The same thing answers for milk, if it is in liquid form. When it thickens a shallow tin pan with wire netting fastened over it answers very well.

Moisture needed

Chicks will thrive very well apparently for the first two or three weeks on a floor, whether covered with dry earth or not, but soon after that there will be trouble. They need moisture, dampness — They must wet their feet. But they must have dry quarters to sleep in at night. I have seen little chicks with their legs just skin and bone dried down for lack of moisture. I had to learn that by experience. My chicks had grown very well in the brooder house, but they gradually stopped growing, feathers stuck out rough, did not lie smooth and close to the body, some of them died; there was an outside run they could go outdoors when they pleased, but they did not go out much. It was in April, rainy, the top of the ground an inch of mud. I took one of the brooders and the chicks and put them out in that mud. In a week no one would have thought them the same chicks; not another chick died, their feathers smoothed down, they began to grow again, and I had learned something. Contact with Mother Earth is what they must have. President Smith, of the Massachusetts Poultry Association, used to raise "soft roasters" on the south shore below Boston. Hatching out thousands of chicks in the fall, as soon as large enough to do without artificial heat they were put out in little colony houses, and the snow swept away, day by day, to let them on the bare ground, even though it was frozen.

Experience With Turkeys

That subject of moisture needs investigation. We have always heard that young turkeys must be kept in until the dew was off the grass; they must not get wet. My neighbor, Mr. George V. Smith, editor of New England Farms, raised, or hatched some turkeys. For an experiment he let them run with the mother turkey wherever they pleased. I think there were nine of the young poults. Out in the dewy morning grass, out in thunder-storms, their umbrella the mother's wings, every night the nine came home. They found nearly all their food; a little was fed at night to induce them to come home. Week after week the nine were all there. Then a fox came into the game, and one by one they disappeared. I think he managed to save three of them.

Living Food

While chicks were still in the brooder house I have carried in a pailful of damp earth and dumped it in the little yard by the brooder, then mixed their cracked grain with dirt, so they would have to scratch for it, and if they found an occasional worm in the dirt then there was "racing and chasing o'er Canoby lea." That matter of taste. I have thrown a piece of worm down in front of a chick, and the chick would stand and look at the squirming thing, but if it ventured to take it in its beak then hesitation vanished instantly and it ran to make sure of having that delicious morsel all to itself, and never again would there be any hesitation when a worm was offered. It's a living food, and no kind of dead food equals it. I have not mentioned green food for chicks, but sprouted oats, lettuce or any tender green stuff it very good for them; almost essential to thrifty growth.

Brooding

During my last few years on the farm I did not use artificial brooders, using hens only for that purpose. I had 40 little A houses, 20 in a row, with 20 chicks to a hen. As they were all white chicks there was never any difficulty about hens refusing the chicks. I kept White Wyandottes and White Leghorns. Occasionally a Leghorn would sit long enough to hatch chicks, and when they do they make fine mothers; far less likely to tramp on their chicks than the larger breeds. I made a long pen in front of the row of 20 coops, dividing it into little pens, one for each coop, the pens being about six by five feet. this prevented the chicks from getting out of the mother's sight, or too to run for cover when the mother's skyward-looking eye descried a hawk.

Sprouted Oats

The green food problem was solved by covering the ground in these little pens with oats and spading them in about a week before the chicks were due to hatch. The hen soon taught the chicks what those green sprouts were for. They would dig up and eat the whole thing, the green sprout, the oat and the long white rootlets, and when they were getting scarce more oats were spaded. When the chicks got large enough to fly over the 14-inch boards forming the pens, the pens were taken away and the chicks left to run wherever they pleased.

The Row of Coops

Those rows of 20 coops were set facing the east. Why? Because it's cool early in the morning. The chick is out with the first streak of dawn, and the morning sun, rising far to the north of east, soon strikes directly into his little house, and he gets the sun's heat when he need's it. Take a row of coops facing the south; the morning sun strikes the back of those coops, the chick is in the shade, and not until 10 o'clock or after does the sun strike the front of these houses and in the midday heat the panting hen has no shade or

TYRONE POULTRY FARM, Fenton, Mich.

relief from the direct rays of the hot sun, while with the coops facing east the hen is comfortable in the shade.

After most of the hens had weaned the chicks and begun to lay the chicks were moved into the corn lot, 300 ft. long by 180 feet wide. A strip 30 ft. wide by 300 long was sown thickly with oats and cultivated in; on the rest of the lot corn was growing. Having been educated in oats, the chicks did not bother the young corn to any extent. A row of houses 3x4 ft., were along the north side of that 30-ft. strip, and the chicks ran in the corn all summer, the corn forming both shade and shelter from hawks. In four years the chicks had practically denuded the ground of weeds. There were about 400 chicks in that lot, remaining there until time to be put into winter quarters.

Yes they do some damage to the corn, stripping the under part of the husk off and eating two or three rows of the under part of the ear. But the fifth year I raised 165 bushels of ears, 133 of shelled corn, on that lot, and all the cultivation it had was the cultivator run through it both ways twice. No hoeing whatever on the main part of the lot; on the south side furthest from the chicks, I had a strip of potatoes the previous year and that had to be hoed. I think 10 bushels would cover all the damage the fowls did to the corn. Foxes bothered, so I plowed a deep furrow around the lot, set posts at the edge of the furrow and put up a six-foot poultry-wire fence around it, letting the wire down into the furrow, and filling it so they could not dig under.

CAPONIZING

EVERYBODY is fond of chicken, but many do not know that capons have the same delicious meat, only more of it. Birds for broiling must be killed while they are still comparatively light in weight, in order to have them at their best, but cockerels when caponized can be brought to a weight four or five times that of the broiler, according to the breed, and still retain the tender, sweet flavored flesh of broilers.

It is difficult to state the exact size or age at which a cockeral may be most successfully operated upon, as different birds develop differently.

As a starting point, however the beginner will be safe in using birds weighing between 7-10 and 9-10 kilo if they are of the Plymouth, Rhode Island Red, Wyandotte, or Orpington breeds. Later as one becomes more familiar with the matter, the birds will be selected by their "look" rather then by weight or age. The proper time is just before the Cockeral begins to make comb, when the generative organs are about the size of a small navy bean. The organs are oval in shape, and at the time most favorable for caponizing are the size of a small pea.

The Operation

Previous to the operation the only preparation necessary is to keep the bird from food and water for thirty-six hours. This will allow the intestines to empty and subside, making the operation much easier and less dangerous.

The present mode of operating is to make a small cut between the last two ribs on either side. This is preferable to one large opening on one side, being easier on the bird and the wounds heal more quickly.

Lay the bird on its side on the operating table. Wrap a cord twice around its legs. Wrap another cord around both wings close to the body. Attach the other ends of these cords to weights like a small stone, letting them hang over the table side, holding the bird safely. A few feathers should be plucked just in front of the thigh, thus laying bare a small space just over the last rib. The surrounding feathers should be moistened to make them lie down and not interfere during the operation. The last two ribs should now be located by the forefinger of the left hand. Having located the ribs pull the skin as far toward the thigh or hip as possible, so that after the operation is completed it will go back to its place and entirely cover the cut between the ribs. With the knife in the right hand, insert it between the last two ribs, cutting through skin and flesh, being careful not to touch the intestines. Make the cut about 25 millimeters long. Insert the spreader, between the ribs, through the incusion, which will spread the ribs apart. Then with the hook pick the thin membrane covering the intestines. When this has been done and the intestines pushed aside the organ (testicle) will be in plain sight. In a bird of the proper age it will be a rich creamy yellow and about the size and shape of a small bean.

The care with which the operator grasps the organs without grasping the blood vessel, or the tissues surrounding it constitutes the whole trick of the operation. Having grasped the testicle with the forceps, twist them around a couple of times and pull them out and cut the twisted cords with a knife. Remove the spreaders and allow the skin to cover the opening between the ribs. In ten days there will be nothing but a shiny scar.

After the testicle is removed the bird is laid on its other side and the other testicle removed.

After the operation, the birds should be placed in a yard by themselves and fed on soft food for three or four days. It is well to examine the birds several days after the operation, to see if there is and swelling (wind puff). If there is, a slight puncture of the skin will correct it. —Progressive Agriculture.

STANDARD REQUIREMENTS OF GOLDEN POLISH FOWL

Will you please publish the standard requirements for Golden Polish fowls?—A. R. V., Croswell, Mich.

—We are giving the standard requirements for the Golden Polish fowl as stated in the American Standard of Perfection.

Disqualifications: Shanks other than blue or slaty-blue.

Male

Head: Face, red.
Beak: Dark horn.
Eyes: Reddish-bay.

Comb, and Crest: Comb, red. Crest, golden-bay, laced with black.

Neck: Golden-bay. Each feather laced with black; coverts, golden-bay each feather laced with black, lacing widest at end, forming two well defined wing bars; primaries, golden-bay, each feather ending with black, the black tapering to a point at lower edge; secondaries, golden-bay with well defined black lacings.

Back: Golden-bay, each feather laced with black; saddle feathers abundant, each feather laced with black, the texture of feathers giving a rayed appearance.

Tail: Golden-bay, each feather laced with black; lacing widest at ends; sickles and coverts, golden-bay each feather laced with black, lacing widest at end.

Brest: Golden-bay, free from mossiness, each feather laced with black, the lacing being proportionate to size of feather.

Body and Fluff: Body, golden-bay, each feather laced with black; fluff, bay, tinged with black.

Legs and Toes: Thighs, bay, each feather laced with black; shanks, and toes, slaty blue.

Under color of all sections: Slate.

Female

Head: Face, red.
Beak: Dark horn.
Eyes: Redish-bay.

Comb & Crest: Comb, red; Crest in pullets black laced with bay, which after first moult should be golden-bay laced with black.

Wattles & Ear lobes: Wattles, red. Ear lobes, white.

Neck: Golden-bay, each feather laced with black; feather in front of neck same as breast.

Wings: Bows, golden-bay, each feather laced with black; coverts, golden-bay, each feather laced with black and black growing wider at the extremity; primaries, golden-bay each feather ending with black and black tapering to a point on lower edge; secondaries, golden-bay with well defined lacings.

Back: Golden-bay, each feather laced with black.

Tail: Golden-bay, each feather laced with black, the black being wider at outer end of feather.

Brest: Golden-bay each feather laced with black.

Body & Fluff: Body, golden-bay, each feather laced with black; fluff, a lighter shade of bay tinged with black.

Legs and Toes: Thighs, bay, each feather laced with black; shanks and toes, slaty blue.

Under color of all sections: Slate. —E. C. Foreman, Associate Professor of Poultry Husbandry, M. A. C

PARALYZED CHICKS

My white Leghorn chicks act as if they were poisoned. They seem to be paralyzed in both legs, fall down, stretch out, quit eating and finally die. They are three weeks old. When they were taken sick I was feeding cracked wheat, cracked corn, chick feed, green grass and chicken grit, before them all the time. I cut out the corn, wheat and chick feed and have been feeding rolled oats, bran, grass and sour milk; have also put permanganate of potash in the drinking water.—Subscriber.

—The trouble is digestive unquestionably. I have seen s--- troubles developed by feeding moldy bran, and it might come from any kind of spoiled or dirty feed. If you have kept all these different feeds before them they have overfed unless they are on range and pick up so much that they do not care much for what is before them in the r-- And that green grass—do you mean that you feed it long just as is comes from the mower, or do you run it through a cutter? If they are trying to eat it without cutting up their little crops may be full of long pieces of grass which they cannot manage. Rolled oats, bran and sour milk make a good ration if you add some hard grain. They need grain to keep their digestive organs strong. The potassium permanganate is an antiseptic but not a remedy for indigestion. As they are a month old by this time they should have a good growing mash. Keep this before them only half a day at first. After a month you can lengthen the time gradually till at the end of the third month it is before them all day. Feed mixed grain morning and evening, either in litter or spaded into the ground if you have not litter. They should by this time be through with chick feed and eating whole wheat and Egyptian corn or cracked corn. Keep the sour milk before them, and feed cut greens at least once a day. It is better to put the green before them about 9 o'clock and let them pick at it all day. Alfalfa and lettuce are the best greens for young chicks, but lettuce is not practicable for a large flock.

SOFT SHELLS

What shall I do for a Light Brahma pullet six months old that lays soft shelled eggs? Her first egg was double yoked and since then she has laid two perfect eggs and several soft shelled. Last night she dropped two at roosting time and I found another under the roost this morning.—Subscriber, Calhoun County.

—Your ration must be to forcing. If you are feeding a laying hen mash change to bran for a week or so and be sure to give plenty of green and keep oyster shell before her. Brahmas mature slowly and should not be pushed for eggs till they are eight or nine months old.

SMALL EGGS

One of my Anconas laid a tiny egg with just a speck of yolk. I have been told this is the last egg off a clutch and that after a rest the hen will begin laying again.—Subscriber, Clayton, Mich.

—Pearl, Surface and Curtis in "Poultry Diseases and Their Treatment," say that these little eggs do not mark the end of a laying period but may be produced at any time. They are usually laid when the bird is in a very active laying condition, and the white seems to form about some foreign body, such as a piece of hardened albumen, a bit of coagulated blood or a small piece of yolk which has escaped from a ruptured yolk. The egg you found was probably formed about a piece of ruptured yolk.

CULLING REDS

I am hatching from a dozen R. I. Red hens mated to a rooster that is the son of a prize winner. What points shall I take into consideration when I come to cull my spring chicks? When should I begin to cull?—R. B., Clayton, Mich.

—You should have a late Standard of Perfection if you think of raising show stock and you should also look at birds that have won prizes. In general, exhibition Reds should have dark, briliant red plumage, free from white, but with black in wing and tail feathers. They should have long, straight backs and the male should have a five point comb. Weight is very important. No bird that is much below standard weight should be considered as an exhibition possibility. Do not begin to cull, except to remove sickly or backward birds, till the males weigh 2½ to 3 pounds. You can tell then whether they will be even in color and blocky in build. All but the best should be sent to market as fryers for there is no market for breeding cockerels that are not fairly up to standard. Pullets should not be so readily discarded for they may make good layers in spite of white feathers of other disqualifications. If you really want a good standard bred flock, however, it is best to get rid of all that are not good color and size.

FINE MEAT SCRAPS MAKE BEST MASH

MEAT scraps in the home-mixed mash for poultry should be ground fine to prevent waste and to insure uniform distribution to all indiviluals of the flock, say poultrymen at the Ohio Experiment Station.

The coarser meat scraps do not mix uniformly with the other ground feeds, so the birds pick over the mash for the particules of meat, causing much waste and what is worse permitting a few birds to get more than is good for them while others are unable to get what they need. After the fresh supply of mash is picked over it is difficult to get the mash consumption required for profitable egg production.

If the other mash ingredients are of proper texture the final mixture will be a uniform product and palatable. To make a mash of this kind standard wheat middlings is preferable to coarse bran and coarsely ground oats or alfalfa.

Many dealers do not carry the fine meat scraps in stock, but it can be obtained from them by special order at the same price as the coarse. When the feed dealer orders meat scraps the coarse product is sent unless the fine meat scraps is specified.

A SENSIBLE EGG CARRIER

A CHOCOLATE or broken candy pail that can be had for a song at any grocery store, makes and excellent egg carrier when treated in the following manner: Take a sheet of the corrugated brown paper board used in wrapping for breakable articles and line the sides and bottom of the pail, as shown in the cut. Then cut circles from other pieces of the same material to use between each layer of eggs, smaller circles for the bottom, increasing in size as the top is approached. Eggs can be gathered from the nests in such a pail and carried to market, with reasonable assurance that few, if any, breakages will occur. The cost of the whole will be but a trifle, and your own grocer may give you all that is needed for the carrier. The corrugated paper can be obtained in large sheets from grocers, to whom it has come packed about breakable goods.

GOOD BROODER ESSENTIAL TO SUCCESS WITH CHICKS

THERE is many a good brood of chicks ruined by worthless brooding arrangements. Some persons can take care of a few chicks in any kind of basket or soapbox arrangement behind the kitchen stove, while others taking hold of the same outfits would fail every time. All such things are but veritable makeshifts at best. If you care to make a real success of raising what chicks you hatch, better put aside all recommendations for fireless brooders, and invest in a good roomy reliable brooder. One that has some reputation behind it, and can produce results which are claimed.

There are various kinds of brooders. In the first place, there is the old-fashioned kerosene lamp heated brooder, which is pretty good, but we think a much better one is the so-called blue flame kerosene heater, which produces a flame very similar to the blue flame cook stove. These are the best of that kind of brooder. Then where a good many chicks are to be brooded in a right cold climate, the hard coal or soft nut coal stove heater for heating a brooding house is good. They are, of course, not calculated to use where a hundred or two chicks are to be warmed. The gist of the whole matter is that no matter what number of chicks you are to take care of from 50 up, do not try to economize by not investing in some kind of a brooder.

Some Factors in Poultry Success

IMPROVEMENT is the constant aim of those who would achieve the highest type of success. Without this desire agriculture would still be in the thatched stable stage of development in this country. And any sort of improvement which is not honestly won, which is not permanent in character, is deceitful. By that we mean that we cannot adopt a type of progress which merely defers the day of reckoning; if we are going to secure high crop yields at the expense of soil fertility, or high egg yields at the expense of the constitutional vigor of our stock, then it would be better not to hazzard it at all.

Success with poultry, especially in improving the flock records, must be built upon the solid rock of honest methods or the structure is certain to come tumbling down about our ears. That is why so many people who seek to beg the question through the feeding of nostrums and stimulants fail to achieve any real success. They have not taken stock of all the factors influencing success. By crowding the hens, by forcing an unnatural production upon them, they have secured temporary results at the expense of the future. And the future has invariably cost them more than the temporary increase made possible.

The very first thing to do, in seeking to improve the home flock, is to take stock of the situation and get an accurate record of what the flock is doing—something upon which an intelligent analysis of future efforts may be based. There is nothing quite so important in any business as a "set of books." The merchant finds them indispensible as to his business success, for they are the barometer which accurately gauges the state of health of that business. No man can do business these days without records of what he is doing and records over a long period of years—comparative statements. Records must be had of the poultry flock before one can attempt improvement.

We do not mean that trapnests should be installed on every farm, or that they need be installed on any farm—although that would be worth while, if it were done—but we do mean that every person keeping poultry ought to know in round numbers at least what his or her flock is doing by days, weeks or months. Too many people imagine that their hens are laying a good deal of eggs merely because they lay at a good clip at certain seasons. Then, too often, no stock is taken of the eggs consumed on the home table, and since they are not checked off, there is a tendency to overestimate them, thereby causing one to decieve himself as to the real productiveness of the hens.

Keep an egg record, and while you are keeping that record keep in mind the fact that commercial poultrymen feel they cannot do business with layers which produce less than 12 dozen eggs per year. How many hens have you producing less than that number of eggs? You can estimate, if you have a total egg record for the year, and it will bring home some astonishing things to almost anyone with a flock which has not been systematically checked.

If you are getting eggs practically the entire year, it will indicate that not all the hens are loafers. The problem, if your egg record is not what it should be, will be to eliminate the loafers and get more of the producers into the flock. And this will be a problem of culling and breeding, other factors in the poultryman's route to success. Culling is no longer much of a problem. Practically every community now has its qualified poultry cullers, usually working through the county agent or the state agricultural college or both. If one cannot command the services of such experts, then the art of culling can soon be mastered by a study of modern poultry text-books and a little practice. Culling is essential because it prevents the propagation of undesirable individuals in the flock, and because it cuts down feed bills and provides room for more producers, thereby giving them a better chance.

Breeding is, of course, important. While every poultry raiser cannot be expected to master the art of breeding, the rudiments of the science can at least be learned. And it means a great deal more than simply selecting a good looking male and turning him loose with the hens and pullets. The more one gets into the subject of breeding, the more important and vital it seems to be. But it is worthy the effort and the study because, in the final analysis, all substantial progress depends upon it. If more people were aware of this truth there would be less of the disposition to fly in the face of nature and do some of the things they continually practice. More people would come to realize that the poultry flock is like a piece of delicate machinery which must be given in proper amount all the elements, the fuel, the lubricant, and the like, necessary to make good performance possible. To attempt to secure results from a motor by placing water in the crankshaft for lubricant, for instance, would be fool-hardy, but many poultry raisers are trying to do just such a thing when they feed them something other than a balanced ration and give good, systematic care and housing. Such a procedure would ruin a good motor and it will ruin a good layer and the [illegible] of her will not save the day, either.

Good f[illegible]s are as necessary as good breeding, whatever the respective purpose you may have in mind. And good feeding means, a balanced ration—a ration which supplies in proper proportion all of the respective elements necessary to achieve the purpose which you have in mind. If it means market eggs, then you must feed a ration which will produce eggs, giving all the elements necessary for egg production and leaving nothing to be supplied by chance. Leaving some one element to chance is one of the reasons why more farm hens do not develop into the producers they should, for it is singularly true, that the average farm hen today is as well bred as the average hen found in any other place The trouble lies in other directions.

It is in recognizing all of the factors which are necessary for success, in giving them their proper place and in seeing that they are discharged that the greatest chance of success comes. Details, we have said before, are the bricks which make success possible, if they are mastered. And they must be overcome or there will be no success in anything we may undertake. They will not denied.—Wisconsin Farmer.

ROOSTING PLACES FOR THE POULTRY

THE arrangement of roosts in the hen-house is a matter of considerable importance. Not only should these be so placed that they may be easily kept clean by the attendants, but the health and contentment of the fowls should be considered as well. The usual method of the farmer in putting up the perches is to nail them to the wall of the house, beginning near the floor and placing them at intervals ladderwise, even up to the roof. Take a look at one of these houses after the fowls have gone to roost and you will find all the birds crowded on the higher perches. This instinct of self-preservation prompts them to get as far away from the ground as possible, a trait inherited from their wild ancestors. Often in striving for the highest perch the heavy fowls are crowded off and receive severe injuries, or in flying down from the roosts they are apt to be injured. Injury in the last mentioned way is a common cause of the so-called bumble-foot, prevalent among heavy fowls. Where perches are arranged in this way the highest is cold and unsanitary. Snow and frost upon the roof may chill the combs and backs of the birds, resulting in sickness and death in the flock.

All perches should be upon the same level and never more than four feet from the floor. Many contend that two feet is the ideal height. The Asiatic breeds should not be expected to roost far from the ground, while the Mediterranean varieties may be given higher perches. It seems to add considerably to the contentment of the smaller and more active birds if they are allowed to roost farther from the ground. They should never be allowed too near the roof, however, for reasons already stated.

An excellent arrangement is a square platform with a perch some

BABY CHICKS
Best Paying, Heavy Laying, Pure Bred Tom Barron English White Leghorns, S. C. Rhode Island Reds, Park's Barred Rocks. Strong Healty Chicks hatched from greatest and best incubator known. Chicks are given full twenty-one days and hatched under proper temperature.
Mr. Frank Fulerson, Niles, Mich., writes as follows: "From the 66 pullets we raised from your stock last year along with the thirty which we had, we got 1,610 eggs in December. Can you beat it?"
We are the first and oldest importers of White Leghorns in this state.
Watch our pen number 17 in the Michigan Egg Laying Contest. It's coming strong! All flocks thoroughly culled and properly mated to pure bred cockerels. Try some real chicks this year. Order now at new low prices. Instructive catalogue free.
BRUMMER-FREDERICKSON POULTRY FARM
Box 26 Holland, Mich.

TOULOUSE GEESE ARE MONEY MAKERS. Two pounds cost less to raise than one of pork. Water not necessary. Every farmer should raise a few. **ALDEN WITCOMB, Byron Center, Mich.** Breeder Giant Toulouse Geese, White Holland Turkeys.

10 inches higher, arranged on the top, which follows for the removal of droppings and thorough cleanliness. This should be the main idea in the poultry house. There should be no cracks and crevices for filth to gather. Such spots are breeding places for red mites, the most destructive parasite that infests our fowls during the day but hide away in the dark corners, where a single female in a few days will furnish the family tree for countless thousands. The aim of the poultrymen should be to allow no harboring places for these insects. The roosting platform described may easily be kept clean. Perches should be so placed as to be readily removed for sweeping off the dropping platforms. One may if desired, arrange the perches with dropping platforms 18 or 20 inches wide, in tiers across one end of the room or house. They should be separate and in no way attached to the walls of the building. Then if all filth is carefully swept away each day, it is always possible to keep the quarters neat and clean. The roosts and platforms should receive frequent treatment with coal-oil or liquid lice-killer. In this way no vermin will be able to gain a foot-hold.

Ample roosting room should be provided for all fowls. None should be allowed to sleep on the ground. Chicks should have shelves arranged for their comfort. They should not be allowed to perch on the regular roosts until three or four months old. By this time their bones will have become firm and solid and the danger of crooked breast bones will have passed. The roosts should be of material about two and one-half inches wide and rounded on the upper edges. This will avoid injury to the fowls' feet. All material used in the house should be dry and as light as possible. The droppings platform should be of smooth matched material to allow for clean sweepings and afford no hiding for mites. Droppings should be swept off daily and the litter in the pens changed frequently.

FERTILITY OF TURKEY EGGS

Please tell me how long before laying turkeys must be mated to insure good hatching? Also how long kept together?—Mrs. C. P., Onaway, Mich.

—The best information availabe on the subject of turkey raising would indicate that the Toms should run with the hens from seven to ten days prior to saving the eggs for hatching. Fertility usually appears on the third day but the highest fertility is not usually secured at least of seven days after the introduction of the Tom.—E. C. Foreman, Associate Professor of Poultry Husbandry, M. A. C.

TURKEYS HAVE ENLARGED KNEE JOINTS

What shall I do for my turkeys? They are late turkeys and would like to know what is the matter with them. They eat good and are in good condition, only their legs are weak and they lay around a good. deal. Their knee joints are enlarged.—Mrs. W. H., Elmira, Mich.

—As to the first one, dealing with an ailment in turkeys, I might say that it is difficult to give a diagnosis from the description given. It may be that the addition of precipitated calcium phosphate (sprinkle lightly over the feed) or the giving of lime water in quantities of two teaspoonfuls a day per bird giving in the drinking water, and also the addition of bone meal would be of assistance in relieving this trouble provided it is of a nutritional origin. If it should be contagious it is necessary that a diagnosis be made before any intelligent advice could be given. If you care to do so you may send us a bird for diagnosis.—H. J. Stafseth, Dept. of Bacteriology and Hygiene, Mich. Agricultural College.

BREED BETTER FLOCKS

TWO points to keep in mind: The cockerel is half the flock and he cannot be too good, and only your best layers should be permitted to rear cockerels to use in your main breeding pens. There seems to be no question any more that the high-producing hen sends her laying character down to future generations thru her sons. I have noticed several times that where a flock of badly colored hens were mated to a fine cockerel the pullets have been much better colored than the cockerels.

Your cockerel breeding hen should be as nearly perfect in form, color, and laying qualities as you can select, and if you have only one such she will provide you with your cockerels. Select your cockerels, sons of your best laying hens, especially for their form and color.

In this way you will soon bring your flock up in all desirable characteristics. To do this to the very best advantage you will need two breeding pens, one to produce cockerels and the other to produce pullets for your main flock, the two flocks to be unrelated as much as can be conveniently arranged. Follow this by strict fall culling and the results will soon be noticeable.

POULTRY NOTES

It is a harmful costly practice to permit little chickens to get wet and cold. Clean, warm, dry quarters are indespensable.

It is a mistake to feed sour or tainted food. All mash or soft food that is not eaten up an hour after feeding should be gathered up and thrown away.

The best method of combating contagious diseases is to dispose of the sick fowls and disinfect the premises thoroughly.

Let the fowls have all the exercise possible to keep their digestive organs working.

The slightest ailment should be treated as promptly as a contagious disease.

A mixture of white and brown-shelled eggs in the incubator will give an unsatisfactory hatch.

Never over feed the young chicks; feed little and often; keep them satisfied, but not overfed.

Good, thick buttermilk is about as good as green bone to make the chicks grow and the hens lay.

Foul air and filth will furnish shelter for contagion.

When the fowls are restless and constantly picking their feathers, it is usually a sign that they are infected with vermin.

No matter how fine the strain, it is careful and intelligent management that counts most in the long run.

Parched corn, wheat and oats offer possibilities for varying the grain ration of the hens. Almost any change of diet will prove good for the hens if they relish the new feed.

Weight and fat conditions count when the hen is wanted for the market but don't sell her as long as she is producing eggs in profitable quality.

The chick does not come from the shell with gravel in its crop. Sharp sand or fine grit should be furnished along with the first meal.

The market demands uniform products. If your eggs are alike, shape and color, you can sell to a fancy market and get a price much higher than you can get at the local grocery store.

Your flock is easier to tend if it is uniform. Leghorns are more active than Brahmas. Plymouth Rocks set well and make good mothers. Leghorns do not. It is hard to provide the best conditions for all of your chickens unless they are alike in rate of growth, size, temperament, and habits.

TRAP FOR WOLVES

I HAVE read a good deal about wolves in the north woods and the havoc they make on deer and offtimes humanity. Now I would like to suggest a trap I heard of from an old hunter many years ago. It is to make a square den on the ground, say twelve or sixteen feet square, five or six feet high, tapper it as it is built up, the opening at the top, say three feet square. The logs of course, are notched close enough so they could not get through. Put an old sheep, cull of the flock, in it and feed him there. The object of the sheep is the scent and a wolf chooses to kill its own game. Drag bloody meat for miles to this trap is a good call. I have heard it said if a pack is attracted the trapper generally gets a good haul. I am an old reader of Michigan Business Farmer and it is complete.—Jas. O Colburn, Jackson County, Mich.

George Washington owned America's first mule. The mule was a present to Washington from the King of Spain, and was named Royal Gift.

White Diarrhea

Remarkable Experience of Mrs. C. M. Bradshaw in Preventing White Diarrhea

The following letter will no doubt be of utmost interest to poultry raisers who have had serious losses from White Diarrhea. We will let Mrs. Bradshaw tell of her experience in her own words:

"Gentlemen: I see reports of so many losing their little chicks with White Diarrhea, so thought I would tell my experience. I used to lose a great many from this cause, tried many remedies and was about discouraged. As a last resort I sent to the Walker Remedy Co., Dept. 680, Waterloo, Iowa, for their Walko White Diarrhea Remedy. I used two 50c packages, raised 300 White Wyandottes and never lost one or had one sick after giving the medicine and my chickens are larger and healthier than ever before. I have found this company thoroughly reliable and always get the remedy by return mail.—Mrs. C. M. Bradshaw, Beaconsfield, Iowa."

Cause of White Diarrhea

White Diarrhea is caused by the Bacillus Bacterium Pullorum. This germ is transmitted to the baby chick through the yolk of the newly hatched egg. Readers are warned to beware of White Diarrhea. Don't wait until it kills half your chicks. Take the "stitch in time that saves nine." Remember, there is scarcely a hatch without some infected chicks. Don't let these few infect your entire flock. Prevent it. Give Walko in all drinking water for the first two weeks and you won't lose one chick where you lost hundreds before. These letters prove it:

Never Lost a Single Chick

Mrs. L. L. Tam, Burnetts Creek, Ind., writes: "I have lost my share of chicks from White Diarrhea. Finally I sent for two packages of Walko. I raised over 500 chicks and I never lost a single chick from White Diarrhea. Walko not only prevents White Diarrhea, but it gives the chicks strength and vigor; they develop quicker and feather earlier."

Never Lost One After First Dose

Mrs. Ethel Rhoades, Shennandoah, Iowa, writes: "My first incubator chicks, when but a few days old, began to die by the dozens with White Diarrhea. I tried different remedies and was about discouraged with the chicken business. Finally, I sent to the Walker Remedy Co., Waterloo, Iowa, for a box of their Walko White Diarrhea Remedy. It's just the only thing for this terrible disease. We raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."

You Run No Risk

We will send Walko White Diarrhea Remedy entirely at our risk—postage prepaid—so you can see for yourself what a wonder-working remedy it is for White Diarrhea in baby chicks. So you can prove—as thousands have proven—that it will stop your losses and double, treble, even quadruple your profits. Send 50c for a box of Walko, or $1.00 for extra large box—give it in all drinking water for the first two weeks and watch results. You'll find you won't lose one chick where you lost hundreds before. It's a postive fact. We guarantee it. The Leavitt & Johnson National Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of this guarantee. You run no risk. If you don't find it the greatest little chick saver you ever used, your money will be instantly refunded.

MARKET FLASHES

MARKET SUMMARY

Wheat gains strength and price advances slightly. Improved export demand causes corn prices to go up. Oats follows trend of wheat and corn. Rye and beans show no change. Potatoes firm and prices are expected to go higher. Receipts of poultry exceed demand at Detroit. Cattle slow to lower. Hogs and sheep active and prices advance. Provisions following the trend of hogs.

(Note: The above summarized information was received AFTER the balance of the market page was set in type. It contains last minute information up to within one-half hour of going to press—Editor.)

FOOTE'S MARKET LETTER

By W. W. Foote

GENERAL farm conditions in Michigan are better than a year ago, and the outlook is encouraging, especially for sheepmen, those who own fair sized flocks being extremely fortunate. Not many farms in this state are changing ownership, and as Michigan farms generally failed to undergo the boom in prices so common during the war in other states of the middle west, they have not suffered a similar decline. Farmers looking for farms can make purchases in Ohio around $85 to $150 an acre, whereas a few years ago numerous sales were made at $200 to $250, and even as high as $300 in some instances. Farms in Ohio are largely rented for $6 an acre. There has been a marked reduction in the rate of interest paid on farm mortgages throughout the country, and sales are made in Chicago of high-class ones netting from 5 to 6 per cent to buyers. The several grains, with the exceptions of wheat and rye, are selling above prices of a year ago, corn being especially higher, and unusually large quantities of corn were fed to live stock during the past winter. The domestic trade of the country is active, being far ahead of last year, and manufacturers are complaining that it is difficult to hire enough workers, even at the unprecedentedly high wages offered. Farmers in many districts report that it is impossible to hire helpers, with carpenters, painters and other workers in the cities getting as high as $1.25 an hour, while miners in the Pennsylvania coal mines have been paid as high as $400 a month. The foreign trade of the United Sttes is growing in volume, the exports for the eight months ending on February 28 aggregating in value $2,657,064,000, comparing with $2,480,021,000 for the corresponding period a year earlier. Meanwhile our imports of gold have fallen off materially, as Europe is paying largely for its imports with various commodities. Of late large quantities of provisions have been exported from our shores to European countries. Rates of interest are unchanged, Chicago banks making loans at 5 to 5½ per cent.

Wheat Sells Higher

The long predicted fall in wheat prices fail to materialize, and, on the contrary, recent sales were made on the Chicago Board of Trade at the highest figures recorded in several weeks. Speculative operations in wheat have increased in volume recently, and when the "shorts" entered the market to settle their trades they were compelled to pay higher prices. It is estimated that 15,000,000 bushels of "short" wheat were bought in the course of a fortnight. Of course, the marked falling off in our wheat exports is a drawback, but stocks are not in the least burdensome. Rye continues to loom up as an important article. in our export trade, it being much cheaper than wheat. Not much corn or oats are being shipped out of the country, yet supplies of both in sight are much less than a year ago. The prevailing belief is that feeding livestock with grain will continue a paying policy, provided farmers have the grain. Late sales were made in the Chicago market of May wheat at $1.22½, comparing with $1.33 a year ago; while May corn sold at 74¾ cents, comparing with 59⅜ cents last year; May oats at 45¼ cents, comparing with 37 cents last year; and May rye at 84½ cents, comparing with $1.02 a year ago.

The Bean Market

In a late issue The Bean and Pea Journal points out that about the only beans in any large amounts are to be found in Michigan and California, and even in those states there are no overstocks. With the admitted large increase in acreage, more beans will be needed for seed purposes than for many years. The Journal hears reports that beans will be grown in many new sections where they have never been raised in a commercial way. The Robust bean is in high favor, and Michigan farmers testify to an increase in yield of fully ten bushels per acre over common beans. Michigan is a large consumer of beans, and heavy shipments are made to other states.

Restricted Demand For Beef

Many families got into the habit during the war of cutting down in their use of beef, and it appears hat in many cases they are still much smaller consumers than in former years. This explains why any marked improvement in beef cattle prices brought about by smaller offerings is quickly lost as soon as normal supplies are received. Last week, for instance, there was a big advance in prices on Monday, because of the eager offerings shipped to Chicago on account of the severe storm, while it disappeared later on normal receipts. Early week sales of prime fat Hereford steers were made at $10.10 to $10.35, and some prime 647-pound Hereford heifers brought $10, an unusual price. Other sales of heifers of superior quality were made at $8 to $9.50, commoner lots selling at $5.50 to $6.50, while butcher cows went at $4.50 to $7.75. Calves were wanted for the Easter trade, and sold much higher, common to prime lots going at $6 to $13 per 100 pounds. Limited offerings checked the trade in stockers and feeders, county buyers paying $5.50 to $8.50, chiefly $6.50 to $7.75. Late in the week cattle sold much lower under larger offerings. A year ago beef steers sold at $6.25 to $9.30 for common to prime. Recent sales of beef steers were made at $6.75 to $9.90, largely at $8 to $9.75.

The Hog Market

The country supply of hogs is understood to be unusually large, and when prices are up the receipts are almost certain to be of liberal proportions. Prices all along have been much lower than a year earlier, but they have for many weeks shown marked rallying power, with a large demand from Chicago packers, as well as eastern shippers. Hogs moving to market grade well on the whole, and the bulk sell within a range of 35 cents, light bacon going highest and 30 cents above the best heavy butchers. Recent Chicago receipts averaged 240 pounds. There is an extremely large domestic consumption of fresh products and provisions, while exports of lard and cured hog meats are running far ahead of a year ago, despite the higher prices. Last week's hog receipts were far larger than a year ago, but active local and shipping buying kept prices almost as high as a week earlier, late sales ranging at $7.25 to $8.50. A year ago hogs brought $8.75 to $10.40.

The Lamb Crop

The first shipments of California spring lambs to eastern markets were started a short time ago. Lack of moisture and high winds have affected adversely the growth of feed in the California spring lamb region. The first shipment of spring lambs for the season reached Chicago the other day, comprising 53 Illinois bred lambs averaging 45 pounds, which brought $18 per 100 pounds. It looks promising for the lamb market, but owners should make their flocks prime and not too heavy. Late lamb sales were made at $13.25 to $15.35, feeding and shearing lambs going at $13.75 to $14.85.

WHEAT

Wheat is slightly lower in price than it was at our last writing and the tone of the market is from easy to weak. During last week trading was quiet and prices showed little change. There was some business reported for export but not enough to change the trend and the best the market could do was hold steady most of the time the early part of the week at prices established the week before. But before the close of the week weakness appeared and a decline in prices followed. There was no news and the dope from day to day was a reiteration of previous facts and views. There is a fight between faith and the old idea of supply and demand. The faith people believe the future will bring crop damage news and active foreign buying. The supply and demand people say stock are heavy and subjecting the market to heavy pressure, while foreigners neglect American wheat in favor of grain from Canada and Argentine. Domestic demand is not active and the bears say these conditions have always brought lower prices in the past and will do so again.

Crop damage reports have not been sensational; in fact, much of the news from the southwest has been favorable. Weather has been just what the plant was in need of over a great deal of the winter wheat territory and in some places the crop appears more promising than it did at the corresponding date last year.

Flour is not active and the mills have been rather slow in taking wheat, but a scarcity of soft winter wheat has developed in the past few days and the Michigan mills are looking for wheat. Mills that had received all the wheat they needed from their own neighborhood from day to day, report that farmers are not liberal sellers now and there is a feeling that the supply of good milling wheat back in the hands of Michigan farmers is not large.

Prices

Detroit—Cash No. 2 red, $1.32½; No. 2 white, $1.32½; No. 2 mixed, $1.32½.

Chicago—Cash No. 2 red, $1.30@1.32; No. 2 hard, $1.19½@1.21.

New York—Cash No. 2 hard, $1.32; No. 2 red, $1.45½.

Prices one year ago—Detroit, No. 2 red, $1.42; No. 2 white, $1.39; No. 2 mixed, $1.39.

CORN

The corn market is easy after a small decline on the closing day of last week. The Detroit market declined ½c bringing the price down to the level quoted in our last issue at Detroit.

Prices

Detroit—Cash No. 2 yellow, 79c; No. 3, 77c; No. 4, 75c; No. 5, 73c.

Chicago—Cash No. 2 yellow, 73¾@74¾; No. 2 mixed, 73½.

New York—Cash No. 2 yellow, 92¼c; No. 2 white, 92¼; No. 2 mixed, 91¾c.

Prices one year ago—Detroit, No. 2, yellow, 63½c; No. 3, 62c.

OATS

Prices in the oat market are slightly lower than they have been at any time for over a month. The tone of the market in general is steady while dealers report they are finding it difficult to dispose of their supplies, demand seeming to be nearly at a standstill.

Prices

Detroit—Cash No. 2 white, 49c; No. 3, 47½c; No. 4, 46c.

Chicago—Cash No. 2 white, 45@46c; No. 3, 43¾@44¾c.

New York—Cash No. 2 white, 56@56½c.

Prices one year ago—Detroit, Cash No. 2 white, 41½c; No. 3, 39½c.

BEANS

During the week before last the Detroit bean market declined sharply and last week it started out to regain what it lost and had advanced 15c but dropped 5c on Saturday which left the price 25c per cwt. under the price of two weeks ago. Trading is quiet. State bean jobbers estimate that bean surpluses in Michigan to be between 1,400 and 2,000 cars. This includes beans in the hands of the farmers other than those retained for seed, and also stocks in elevators. Using the smallest estimate, at 40,000 lbs. or 400 cwt. per car this would bring the total holdings in Michigan to well over 6,500 bushels which jobbers say they are confident will take care of all demand unless conditions change and business becomes brisk. Elevators throughout the state are reported to be offering from $7 to $7.25 per cwt. with the lower figure leading.

Prices

Detroit—C. H. P., $7.40 per cwt.

Prices one year ago—Detroit, C. H. P., $6.95 per cwt.

RYE

Rye seems to be without friends, nobody wanting it, and prices were on the down grade last week.

Prices

Detroit—Cash No. 2, 81½c.

Chicago—Cash No. 2, 81½@82½c.

Prices one year ago—Detroit, Cash No. 2, $1.04.

POTATOES

The potato market has been steady the greater part of the time during the past fortnight and changes in prices have been only slight. The price at Detroit is higher than it was two weeks ago. Supplies are small on Michigan markets as storms held up shipping, farmers were unable to get their potatoes to town because of the bad condition of the roads. Larger receipts are expected from now on.

Stocks of white potatoes in the hands of growers and dealers in the United States March 1 are reported at 171,555,000 bushels to the United States Department of Agriculture. Comparative figures with other years are not available. Of the total stocks 23,968,000 bushels are reported as unfit for food or seed, 60,514,000 bushels will be needed for food and seed on farms where grown, 27,278,000 bushels are held for consumption in local markets, and 59,795,000 bushels are available for movement by rail and other means out of the counties where produced. More than one-half the quantity of potatoes available for shipment are in Michigan, Wisconsin, Minnesota and North Dakota.

Stocks in hands of growers and dealers March 1 to 21 Northern States which usually produce about four-fifths the total crop are reported at 152,117,000 bushels, which is approximately 42 per cent of the estimated crop in these States. Stocks on hand March 1, 1922, were 102,764,000 bushels, or 35 per cent of the estimated crop in these States last year.

A good market is said to be awaitin the northern shippers since the East is running short of old stock, there being reported scarcely more than 50 cars for shipment from New York state and not more than 15 to 20 per cent of the entire crop left in Maine. Michigan potatoes are reported to be reaching a market in New York city even now, indicating a continued strong market in this commodity it is said.

Prices

Detroit—Michigan, $2.00@1.50.

Chicago—Wisconsin round whites, $1.25@1.30 per cwt; Idaho rurals, $1.40 per cwt.

Prices one year ago—Detroit, Michigan, $1.97.

HAY

Hay markets generally remain fairly firm, but the warmer weather is causing some slacking in the recent urgent demand. Eastern markets show some irregularity and val-

PRITCHARD'S
WEATHER
FORECAST
INTERPRETED BY THE STARS

Week of April 1

THE greater share of this week will be unsettled with light rain or snow flurries occuring in Michigan. This general storminess will increase to a full fledged storm of high winds, rain and snow beginning about the middle of this week and lasting through Thursday and probably Friday of this week.

Previous to the arrival of this severe storm to Michigan the temperatures will rise unseasonably high but at the end of the week the temperatures will have fallen and the sky become mostly clear. However, there is a probability that some unsettled weather conditions will affect parts of the state at tail end of the week.

Week of April 8

Unsettled and stormy conditions are to be expected in Michigan during first part of this week. The winds will be moderately strong during this time and the temperatures moderate to cool.

During the middle days of the week and until near the close the weather is expected to be fair in Michigan. As Friday and Saturday approach the temperatures will be rising and some unsettled, showery weather may be expected in the state.

Potato Outlook Poor

The probability of a potato yield above the normal in Michigan this season will range from 25 to 75 per cent with the later plantings getting the best chance, those who plant spuds about middle of June, believing they will dodge the hot, dry weather of late summer, will find this year very different.

This year we believe the weather before June 15th will average cold and wet while the latter part of June will average warm and wet. However, the entire summer season we figure will average cool and with about normal rainfall. Except for severe frosts the harvest season will be favorable for potatoes.

Judging by the general characteristics of the Rurals, there will be less tendency for this variety to become hollow this year. In as much as we are expecting droughty conditions during latter part of August, this variety will stand the conditions better than most kinds. The Green Mountain and Gold Coin are also well adapted to the 1923 season but should be planted early.—L. N. PRITCHARD.

WEATHER FOR SUMMER

As I am a raiser of pure bred chickens, turkeys and geese, and also reader of the M. B. F. paper, would like your advice on what kind of a season I might look for this coming summer. The weather makes a big difference in my poultry business. Do you expect it to be cold and dry, cold and wet, hot and dry or hot and wet? Which do you think it will be?—H. S., Rapid City, Mich.

—We are expecting the spring and summer of 1923 as a whole to average cooler than usual in Michigan judging by what we believe will be the average eastward track of the storm centers for the period in question.

The exception to this general statement will apply during latter part of May, most of June and about first two weeks of July, when temperatures will be warmer and thus help bring up the general deficiency.

We are also of the opinion the summer months will average only normally wet in this state but that there will be an over amount of cloudiness.

The lack of sunshine together with the average low temperature will not, of course, be the best condition for your flocks. As a consequence, we suggest you house your young broods of turkeys, especially, in warm quarters, particularly during early summer which we believe will be damp.

The grown turkey will range farther than the average from his home this year, we believe and with a fairly good crop of grasshoppers expected, feeding should be easy picking for them.

ues are not steady. Bad roads are still restricting country loading and there are no accumulations of hay reported at any market. The reserves on Michigan farms March 1st are estimated at 38 per cent of the crop, which is considerably more than usual at this time, the reason given being that last year's crop was unusually large, that it has been difficult to obtain cars and that the prices have been satisfactory to farmers who could hold their stock.

Prices

Detroit—No. 1 timothy, $16@16.50; standard, $15.50@16; light mixed, $15.50@16; No. 2, timothy, $14@15; No. 1 clover mixed, $13@14; No. 1 clover, $13@14.

Chicago—No. 1 timothy, $21@23; light mixed, $19@21; No. 2 timothy, $18@20; No. 1 clover, $15@16; No. 2, $13@14.

New York—No. 1 timothy, $24@25; light mixed, $22@24; No. 2 timothy, $20@23.

Prices one year ago—Detroit, No. 1 timothy, $19@20; standard, $18@19; No. 2 timothy, $17@18; No. 1 light mixed, $18@19; No. 1 clover mixed, $15@16; No. 1 clover, $14@15.

Alfalfa—Chicago, No. 1 and choice, $22@23; No. 2 and standard, $16@19.

MISCELLANEOUS MARKET QUOTATIONS

Detroit, Tuesday, March 27th

BUTTER—Best creamery, in tubs, 50@51c per lb.

EGGS—Fresh, 24½@25c per doz.

APPLES — Greenings, $1.75@2; Baldwins, $1.65@1.90; Spys, $2@2.50; other varieties, $1.50@1.75 per bu.; western boxes, $2@3; in barrels, Greenings, $5.50@6; Baldwins, $5.50@6.

WEEKLY MARKETGRAM

U. S. Bureau of Agricultural Economics

Washington D. C.—For the week ending March 24, 1923.

FEED—Markets dull and prices lower. Linseed meal and wheat feeds continued downward trend and May bran is quoted at $5 below prevailing prices. Stock most feeds in excess of demand. Fair demand for nearby wheat feeds. Cornfeeds in ample supply. Gluten feed prices steady, hominy feed prices easier. Cottonseed meal in liberal supply by resellers and a few large offers are made by mixed feed manufacturers. Fair export demand from Texas. Production most feeds good. Movement fair. Quoted March 23—Bran $27.75; middlings $27.50; flour middlings $29.25; Minneapolis; gluten feed $42.65 Chicago; white hominy feed $28 St. Louis; $28.50 Chicago; 31 per cent linseed meal $40 Buffalo; 36 per cent cottonseed meal $38 Memphis; $40 Atlanta; 34 per cent linseed meal $43.75 Minneapolis.

DAIRY PRODUCTS—Butter markets unsettled during week. Uncertainty as to production and supplies during the immediate future has added to the uncertainey of the market. Some California butter on Eastern markets at selling prices is slightly under corresponding grades of regular receipts. New Zealand, Danish & Argentine butter also selling in a limited way. Tone of the market firm at close today. Closing prices 92 score butter; New York 50½c; Chicago 51½c; Philadelphia 50½c; Boston 50c.

REVIEW OF BUTTER MARKET

POWERFUL conflicting factors placed the butter market, during the week ending March 24 in so nervous and sensitive a position that only a slight disturbance would have been necessary to have caused either a sharp advance or a rapid decline. On the one side was sentiment which resisted every advance and greatly favored declines. In view of the rapidly approaching season of flush production, the trade generally felt that prices were too high. All trading was featured with the greatest caution. Speculative demand was almost entirely lacking. Receivers pressed goods for sale almost on arrival and buyers purchased only for orders on hand. Each operator was nervous until he had passed his purchases or receipts on to the next fellow in his line. Those conditions were conducive to weakness and confidence could only be restored by a decline in prices.

On the side of strength were light receipts, due to delayed shipments and possibly to a decrease in the make. Stocks on all markets were generally so closely cleaned up that a decline was almost impossible. The small supplies which appeared in some quarters at times would no more than seem to give the market a weaker tone when they would melt away again under an urgent demand from jobbers. The market showed some declines and some advances, depending on whether sentiment or light supplies was the stronger in its influence but by the close of the week under review no indications of a definite trend appeared.

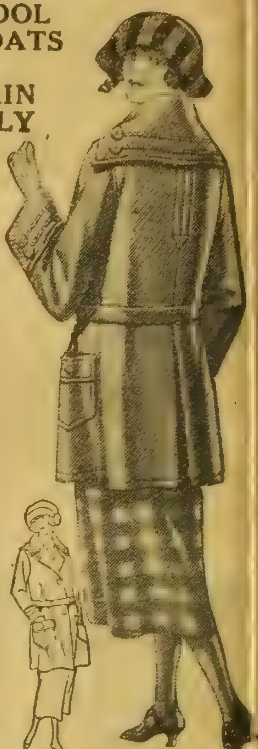
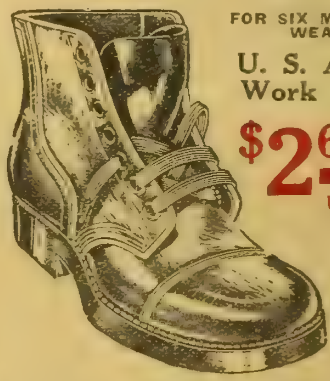
ALL WOOL POLO COATS A BARGAIN AT ONLY

$4.98



Think of this beautiful all wool polo coat in a snappy smart model for only $4.98, made of genuine all wool polo with beautiful large collar with two rows of stitching and novelty buttons. Has inverted pleat in the back like the best made coats and two novelty pockets button trimmed. 34 inches in length Comes in beautiful colors of reindeer tan, and Copen.. Misses' sizes 14 to 20. Women's sizes 34 to 44. **Order Tan by No. 96E6900. Order Copen by No. 96E 6901. Order now at our risk. We know you will be more than pleased. Send no money. Pay $4.98 and postage on arrival. Your satisfaction guaranteed or money cheerfully refunded.**

GUARANTEED FOR SIX MONTHS' WEAR U. S. Army Work Shoe



$2.69 UP

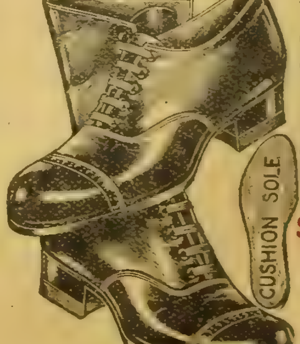
Men! Don't lose a moment in ordering this wonderful brown work shoe. It is made of leather as near waterproof as can be made—solid leather through and through with full grain leather uppers, guaranteed to wear six months. Easily worth $5.00. Two full, heavy double soles, sewed and nailed for greater strength. Extra wide, full leather counter, riveted to prevent ripping. Sizes 7 to 11, wide widths. **Order by No. 96A699. Send no money. Pay $2.98 and postage on arrival.**

Boys' Guaranteed Shoes

Six months' guarantee

Two full green chrome waterproof leather soles, solid leather heels. Munson army type. Barnyard acid-proof. Sizes 1 to 5½. Wide widths. State size wanted. Send no money. **Order by No. 96A550. Pay $2.69 and postage on arrival.**

Women's Comfort Oxfords or High-Cut Shoes Only



$1.98

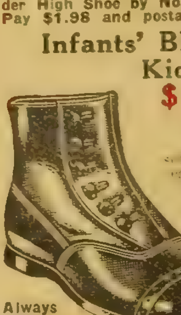
Send No Money SIZES 2½ to 8

State Size

Every woman should get a pair of these sensible broad toe shoes at this amazing price. Uppers of soft kid-finish leather. Solid oak leather soles. Low rubber heels; comfort cushioned insoles. Sizes 2½ to 8. **Order Oxford by No. 96A233. Order High Shoe by No. 96A263. Send no money. Pay $1.98 and postage on arrival.**

Infants' Black or Brown Kid Shoes

$1.09 Up



Always State Size

A real money-saver — infants' soft kid leather shoe in black or brown. Has fine soft uppers, flexible solid oak leather sole. Sizes 3 to 8. **Order Black by No. 96A-1115. Price $1.09. Order Brown by No. 96A1118. Send no money. Pay $1.29 and postage on arrival.**

PROGRAM OF POTATO GROWERS EXCHANGE

THE program for the Michigan Potato Growers Exchange for improving the status of the potato industry in Michigan in 1923.

WHEREAS, the potato industry of Michigan during the past season has severely suffered from the bad effects of 1. Country-wide overproduction. 2. Car Shortage. 3. Field Freezing. 4. Inferior Quality. 5. Rough handling of green stock. 6. Insufficient grading and sorting. 7. Improper conditions in storage. 8. "Bearing" the market by unscruplous buyers and brokers within the state. 9. Over specialization in potato production in certain localities, and

WHEREAS, it is our belief and conclusion that these conditions are generally amenable to correction, and that the bad effects of all can be greatly modified by a campaign of education and preparation, therefore

BE IT RESOLVED, that we, the Directors and Officials of the Michigan Potato Growers' Exchange go on record in favor of and hereby pledge our support to the following program for improving the status of the potato growing industry in the state of Michigan.

Program

1. The promotion of an educational campaign for more careful sorting and grading and the feeding of the surplus in case the Government Crop Report for August 1st shows a possible crop of 380,000,000 bushels or more.

2. To insist that the Railroads of the State, in their capacity as Common Carriers, take steps immediately to live up to their franchise obligations and proceed to equip themselves for handling in an orderly and expeditious manner the tonnage offered for shipment. If an unbaised presentation of the seriousness of our case does not meet with adequate response on the part of the Railroads, then we advocate the leasing of a reasonable number of refrigerator cars by the Exchange. As further precautions toward the end of meeting the bad effects of car shortage we advocate more early shipping in box cars and a careful study by Exchange members of the system of pooling all potatoes by seasons as a means of equalizing the prices to growers which result from enforced inequality of shipping.

3. Earlier planting of the late crop, to secure maturer stock; and earlier digging to avoid possible danger of field freezing.

4. The improvement of the quality of our commercial crop by the more general use of certified or high quality seed; seed treatment; early planting; control of leaf diseases by high pressure spraying.

5. The use of machine diggers where possible; more careful handling in field and warehouse; and the elimination of unduly severe sizing machinery in potato warehouses.

6. In case of a normal or overproduction we advocate very careful sorting and grading in order to put an attractive and superior quality pack on the market, also the use of trade-marked sacks for each grade adopted by us in order to realize both financially as well as an increased favorable reputation on the prestige established by our quality offerings.

7. Inspection of all potato warehouses and the installation of proper heating and ventilating facilities to prevent abnormal heating, sweating, molding and discoloration.

8. More general pooling of potatoes through the cooperative marketing associations; also an educational campaign to unveil the "bearish" practices of unscrupulous buyers and brokers within the state.

9. The system of farming, in some localities, which limits the amount of live stock and legume hays, in favor of specialization in potato growing, we believe to be fundamentally wrong. We advocate enough dairy and other stock to take care of all the cull potatoes during years of normal production and consume the surplus during years of over-production.

BEET GROWERS HOLD ANNUAL MEET AT SAGINAW

THE annual meeting of the Michigan Sugar Beet Growers Association was held in Saginaw, March 28th, at the auditorium. Being a state meeting it was not very well attended by the actual growers of beets. Many were there that used to grow beets but on account of labor conditions did not know as they would grow any. General satisfaction of the 50-50 contract principal was expressed. It was conceeded that the factories and growers would have to co-operate in the most sincere manner or the sugar beet industry in Michigan would become a thing of the past. The speakers were A. B. Cook, Master of the State Grange; Hale Tennant, of the State Farm Bureau; Harold F. Pitcerian, president of the Owosso Sugar Co.; Tom C. Price, president Michigan Sugar Beet Growers Ass'n, and C. E. Ackerman, manager Michigan Sugar Beet Growers Ass'n. Practically all the old board of directors were reelected with a few additions, including A. B. Cook and others.—C. E. Ackerman.

TO LOWER WIRE RATES BETWEEN TWO PENINSULAS

REDUCED toll and long distance telephone rates between cities of the upper peninsula and points in the lower peninsula of Michigan will be put into effect April 21, according to a schedule filed last week with the Public Utilities Commission by the Michigan State Telephone Company.

Judge Franz C. Kuhn, president of the telephone company, states that this move is in line with the company's policy of doing everything possible to bring closer together the distant points of the state.

NINE STATES NOW HAVE FILLED MILK LAWS

SIX additional states have enacted filled milk laws to prohibit the manufacture and sale of filled milk within the state boundaries, in the past two months, according to the report of the Extension Service of The Holstein-Friesian Association of America. These states are Iowa, Kansas, Missouri, South Dakota, Massachusetts and Vermont. In Vermont, the bill was passed over the veto of the Governor. Three additional states—Wisconsin, New York and Ohio formerly had filled milk laws.

Filled milk bills are now pending in Illinois, Minnesota, Michigan, Connecticut, New Hampshire, Pennsylvania and Wisconsin.. In only one state, Indiana, has filled milk legislation been defeated.

False advertising bills designed to prohibit the use of the dairy terms, dairy cow pictures and the name of dairy cattle breeds the advertising of butter substitutes have been past by the states of Missouri, South Dakota, Ohio, Vermont, New Jersey, Massachusetts and Deleware in the past two months. States already having false advertising laws are Iowa, Michigan and Pennsylvania, now making a total of eleven. A false advertising bill inroduced into Kansas legislature is the only defeat reported.

False advertising bills are pending in Illinois, Minnesota, Wisconsin, New York and New Hampshire.

THE MILK POOL IN AUSTRALIA BETTERS SITUATION.

AUSTRALIA has made considerable progress in the solution of the problems involved in satisfying both the producers and the consumers of milk as to prices, according to M. R. Harrison, publisher of The Producers' Review, of Toowoomba, Queensland. Mr. Harrison is making a study of agricultural economics in the United States. A few days ago, he discussed with representatives of the World's Dairy Congress Association the probability of getting a large delegation from Australia to attend the Congress. This is to be held from October 2 to 10 opening at Washington and including sessions at Syracuse, N. Y., with a one-day stop at Philadelphia en route. Australia has officially accepted President Hrading's invitation to send representatives to the meeting.

The elimination of overhead charges, or "spread", has been one of the most important means employed by the Australians in improving the milk situation. This has been made possible through the formation of a dairy "pool" in Queensland, according to Mr. Harrison, Australia has had much experience with the pools in the sphere of agriculture. Some of these pools, notably the wheat pools, have been formed by act of the Government. The dairy pool is voluntary. The economics effected by its managers have enabled them to pay the farmers more than they had been receiving for milk and consumers are required to pay no more than formerly and some are getting a reduction.

Your Telephone Manager Is Responsible to You for Good Telephone Service

Your Telephone Exchange Manager is *directly* responsible *to you* for your telephone service.

We urge you particularly to meet and know him.

Sometimes, there may be little, irritating difficulties with the service that the ordinary trouble report does not seem to quite clear up. In such cases the Telephone Manager will make it a matter of personal attention to see that service is restored to your satisfaction.

But don't wait until then to make his acquaintance. Drop into your telephone office, some day, and meet him. If he is not in, capable representatives will gladly attend your telephone needs. Or leave your card, and the Manager himself will call on you.

The telephone people will give you any information about your own telephone service or about telephone matters in general.

They are animated with just one purpose—their primary and most important business is to serve you.

State Income Tax Promises Property Tax Relief

Byrum Bill now before the Legislature Taxes Personal Incomes, Exempts Dependents, and will, its Sponsors Claim Eliminate Property Tax—Quick Action from Rural Districts Necessary

By LANSING CORRESPONDENT

IF YOU WANT THE GENERAL STATE PROPERTY TAX SHIFTED FROM THE FARMER TO THE NET INCOME OF ALL INDIVIDUALS—ACT

THE Byrum Income Tax Bill, (House No. 377) is at this moment before the legislature of the State of Michigan. This bill, with which you are undoubtedly familiar, provides for a state income tax of four per cent (4%) on the net income of every individual, who has been resident of the state for six months or more of the taxable year, allowing deductions of $1,000 for a single person, $2,000 for a married person and $400 additional for each child under 18 years of age or any dependent incapable of self-support.

The tax would become effective covering the net incomes of all individuals for the year 1923 and would be payable March 1, 1924 and each year thereafter. This state income tax would be deductable from the net income reported to the federal government.

That in a nut-shell is House Bill No. 377.

At Lansing, in view of the defeat of the income tax measure at the last election they are puzzled as to whether the farmers of Michigan are solidly for this Bill or not.

It is hard for The Business Farmer to understand in view of the small amount paid on net incomes to the federal government by the farmers of Michigan and the very much larger proportion of these taxes, paid by urban dwellers why any farmer should oppose the state income tax.

There is, undoubtedly, a powerful lobby at work in Lansing to defeat the present bill. Your representative must know that you, the farmers of their districts, are solidly behind them if you expect them to vote in favor of it.

There is not one minute to be lost. Do not depend on the mails. A telegram or a telephone call to Lansing will cost you little and get you immediate attention, if it can have the backing of your local arbor, grange, farm bureau or cooperative, so much the better. If you do not have time to call a meeting, get the approval of the officers and sign your appeals or pledges of support with the names of these officers and the name of your organization.

THE proposition to provide the state of Michigan with an income tax which is based on the net income of all individual citizens is not a new one. At the last November election an income tax amendment was presented, which was designed to provide for a graduated income tax, the exact amount and all details being left to the legislature for their special enactment of laws to control its operation.

This amendment was voted down by a considerable majority which gave rise to the statement from the opposition that the people of the state of Michigan did not want an income tax law, and had proven it by their actions at the ballot. This statement is not believed to be founded upon facts. Certain it was that the residents of the rural districts in Michigan did not understand the meaning of his income tax, and there was no promise made in the discussion of it that there would be relief from the property tax, or that there was any possiblity of the income tax taking the place of a property tax, or providing sufficient funds to enable the state to entirely eliminate the property tax.

The Byrum Bill

Shortly after the first of the year representative Warren E. Byrum of Leslie, introduced a state income tax which seems to meet the crying need of the hour; that of raising sufficient funds to cover the operation of state expenses and to lower the tax on those who are least able to pay them.

This bill, known as House Bill, No. 377, supposes a personal income tax of 4% on all individual incomes from all sources. It will yield a revenue to the state treasury of from 14 to 16 million per year. is in addition to the corporation privilege fee as provided by the 1921 legislature which raises from $5,500,000 to $8,000,000 per year, and will, with its addition of the four million dollars received annually from other state sources, being the total receipts for the general fund of the state to from 23 million to 28 million annually.

General property taxes are said to have increased practically 700%, from 1901 to 1921, and the property itself has been increased in assessments over 400%, while the average cost of state and local government has increased from $17.49 per thousand in 1901, to $28.88 per thousand in 1921. The fact is, that so serious has become the problem that in 1921 about one tenth of the home-owners, farmers, and property owners in the state were unable to pay their taxes and they were returned as delinquent. It has come to a point where there is serious weight given to the proposition that there is little incentive for one to purchase or farm in the state of Michigan.

Estimated Revenue for State

Experts have figured that on the basis of a 4% income tax as provided in the Byrum bill, the state will raise from between 15 to 20 million dollars annually. In 1920 according to the United States Internal Revenue Department, 305,000 persons in Michigan have a taxable income of 470 million dollars, which at the rate provided by the Byrum bill of four per cent would yield to the state 18,800,000 dollars annually.

The income bill now before the legislature does not exempt state employees or school teachers who would all be forced to pay four per cent on their net incomes as would all other citizens of the state.

Unlike the federal income bill, the Byrum bill No. 377 taxes not only the net income but includes incomes from rentals, interest, profits, dividends, salaries, professional services, and all services whatsoever, except salaries of U. S. Officials, U. S. Government Bonds, and state soldiers' bonus bonds, which could not legally be taxed by the state.

Farmer Will Benefit Most

Needless to say, it is the farmer of Michigan, who will as a class, secure the greatest benefit from the passage of this act, and it is to the farmer that the legislature is looking for an answer as to whether or not the farmers of Michigan wants this income tax passed at the present session.

In brief, house bill No. 377, provides a state income tax of four per cent to be imposed upon every individual who has been a bona fide resident of the state for six months or more during the tax year, upon his entire net income deducting an exemption of $1,000 for a single individual, and $2,000 for a married individual, in addition to which, $400 may be deducted for each child under 18 years of age, or for any dependent who is not capable of self support. The tax is collectable March 1st, each year, beginning March 1st, 1924, on the income for 1923, and thereafter falls due 15 days before the Federal income tax from which all state taxes may be deducted.

The total receipts from this tax would go under the General Funds of the state, and thereafter could be used as the legislature saw fit to appropriate it.

It is interesting to know how the Byrum bill would benefit the farmer tax payers of the state. In 1921 the property tax collected was as follows:

State Corporations	$ 5,625.000
Other city property....	7,275,000
Villages of state........	1,550,000
Twps. outside villages	6,000,000
Total................	$20,450,000

This shows that more than one-third of the actual property tax relief would directly affect the farmers of Michigan irrespective of their interests outside of the township in which they reside.

Bringing the proposition of the state income tax directly to your own door Mr. Reader, can you figure that your income tax in the state of Michigan would be approximately the same as you paid on the federal income tax the past year; in other words, the four per cent and the exemptions allowed are comparable to it, and would be in addition to it,

Income Tax Is Justified

An income tax measure is always justified by its sponsors because it derives its revenue from those who are best able to afford it. Other states in the union have provided themselves with an income tax. The state of New York, being an example of the successful operation of an income tax which provides sufficient money for the operation of all state departments.

Michigan is, as pointed out by Dr. Friday in a recent article in the Business Farmer, an industrial state, which must provide some encouragement to the farmers who are to supply her directly with the food products which she consumes. In no more direct way could this encouragement be offered than thru the establishment of a state income tax which the present legislature is able to provide.

Inquires made by the Business Farmer representative at the capitol this week, disclosed the fact that this measure is tied up in the hands of a committee, two members of which have been on the investigating committee traveling thru the sugar beet countries, holding meetings in regards to the employment of child labor in the beet fields. Other members of the committees are inactive, and the chairman insists that if a meeting is not called, and action taken before the end of the present week, he will ask that a new committee be appointed.

There is yet time for the farmers of Michigan to make their voice known, and every local organization in the state, has within its power to let both representative and senator at Lansing, know that the rural community is solidly behind him in his vote for the passage of this law at the present session.

Political observers believe that this measure will pass the House quickly, and that particular pressure should be brought upon the Senate where its passage will not be as easy. There seems to be no doubt but that the governor will sign it, and it would become operative covering the net incomes of the present year.

FARMERS' TAXES IN 1922 EXCEEDED INCOMES

TAXES which the farmers of the United States were called upon to pay in 1922 amounted to a larger sum of money than the total net incomes of the farms of the United States of the same year according to official statistics recently made available. Agriculture cannot prosper until the tax problem is properly solved.

Saving Mother Those Extra Steps

Dan Baxter Shows His Father How They Can Intall a Kitchen Sink for Mother At Little Expense

By MILON GRINNELL

There should be a sink in the kitchen of every farm home in Michigan. The cost of installation is very small and the extra steps saved in one month more than pays for it.

"THANKS, Dan, for drying the supper dishes," said Mrs. Baxter, as she took the dish towel from the hands of her son and hung it up to dry. "I have had a busy day today and am very tired."

"Glad to help you mother," replied Dan.

He stood watching his mother as she carried her pan containing the dish water to the back door to empty it into a pail. Then glancing thoughtfully about the kitchen he passed into the livingroom where his father sat reading the daily paper.

Dan Baxter had just completed his first year at the Michigan Agricultural College and was helping his father during the summer.

At College he was learning the value of farm home conveniences, how they make life on the farm more pleasant and pay the cost of installing within a short time through work and time saved. He had never noticed very much the lack of the things that make a home modern until this summer, and it had never been brought as forcefully to his mind as it was when he stood watching his mother carry her pan of dish water to the door to empty it into a pail. His father had the latest machinery to do his farming with and his barns were most modern. His father was a good man but he was so busy with farm work that he thought little of the house or mother's comforts.

Dan walked up to where his father sat.

"Dad," said he, as his father glanced up at him from the paper he was reading, "you have been so busy with the farm and I with my school work that we have neglected mother. She is working very hard and we can make at least a part of her work much easier."

"Now what put that idea into your head?" John Baxter's voice was deep and pleasant to hear. "Mother never said anything about wanting anything. Whenever she wants a dress, or dishes or anything she always just goes and buys it. She is a pardner in the business, son, and knows what we can afford as well as I do."

"That proves what I just said," exclaimed Dan. "You are too busy with your farm work to notice. Mother takes hundreds of steps each day that we can save her——"

"How?" interrupted his father.

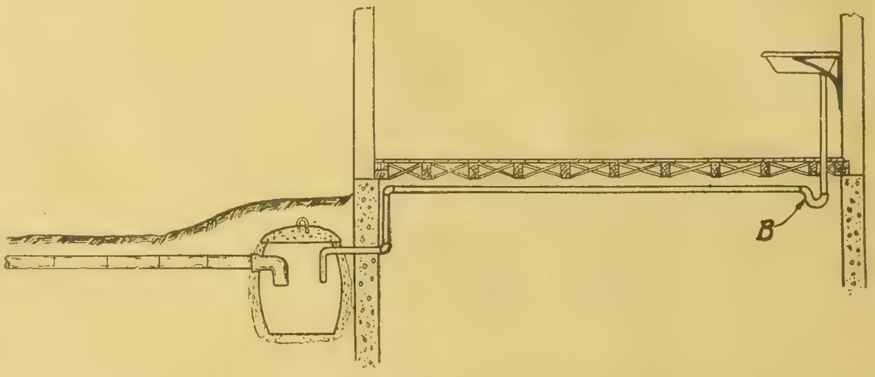
"By putting a sink in the kitchen," said Dan.

"But we can't afford any such thing. We would have to hire a plumber to install it properly and put in the drain—no, that will have to wait a while yet." And his father returned to his reading.

But Dan was determined to get a hearing as he knew his father would install the sink at once if convinced that it could be done at a reasonable expense.

"If you will listen for just a few minutes, dad, I can tell you all about how we can install the sink ourselves and the expense won't break you either."

John Baxter was thinking about what the boy had said to him about neglecting his wife. He hadn't noticed. Dan was right. He folded the paper, laid it on the table, and turned toward Dan.



A trap (B) should be placed in the sewer line when the sink is eight feet or more from the outside wall. This prevents the backing up of offensive gases caused by the accumulation of waste matter in the pipe from the sink to the grease trap.

"Alright, son, shoot," he said.

"First, we will consider the cost," began Dan. "The total cost of installing the kitchen sink, aside from labor, all of which you and I will do, will be $12.50 to $22.85, depending on the kind of sink you put in."

"Is that all it is going to cost us? Why I thought it would be about twice that. But do you understand all about installing one?" questioned his father.

"No, I don't, but I have a bulletin that I brought home from the M. A. C. that explains in full about it. Just a minute and I'll get it." And he went up the stairs leading to his room taking two steps at a time.

In this case the sink has not been properly installed. In the first place it is placed back in a corner where the light is very poor. No woman would care for a sink located like this one. It should be near a window. Also this sink has an inadequate method of sewage disposal. When the pail is full it is necessary to carry it outdoors making many steps that are not necessary.

Mrs. Baxter came into the room having completed her work and her husband noticed for the first time how tired she looked. She was working too hard, he could plainly see now. Have to pay more attention to her comforts hereafter, he decided.

"Where is Dan?" she asked.

"Just gone up to his room for a couple of minutes. Had a hard day of it, mother?"

"Yes, I have, John. and I am rather tired. I guess I'll go straight to bed."

Good idea," said her husband. And as Dan came down stairs. "Dan and I have a little figuring to do before I roll in."

Dan bid his mother goodnight and then drew a chair up beside his father's.

"Here's all the dope," as he opened the bulletin. "We will take a paper and pencil and write down what we need."

"You read 'em off and I'll write 'em down," And suiting actions to words his father secured paper and pencil.

"Here they are: A white enameled sink, 20 inches by 30 inches, price from $6 to $14, depending on quality——"

"I'll put down $14, might as well be the best 'cause it is the cheapest in the long run," said Mr. Baxter.

"That is a good idea," agreed Dan. "It says here in the bulletin that for ordinary kitchen use, sinks of cast iron white enameled are best. Sinks of painted cast iron and also of sheet steel can be obtained; however they are not as easy to keep clean."

"The rest is as follows," continued Dan. " 'One pair sink brackets or sink yoke, 50c to $2.50; 12 feet of 1⅛ inch lead pipe, $2.50; ¼ pound of putty, 10c; 50 feet of 4 inch drain tile, $2; 2 sacks of cement, $1.50, 1 yard of gravel, 25c."

"Now that we have the material what are we going to do with it?" laughed his father.

"The first thing to decide is, where the sink is to be put," said Dan.

Mr. Baxter thought for a moment. "Of course, that will be up to mother, but I suppose she will want it under that window on the north side of the kitchen. That would be a fine place for it as the light is very good and then it is near the stove so she would not have to take so many steps."

"Alright, dad, we will leave that for mother to decide. Now the next thing on the program, according to the bulletin, is how high the sink is to be from the floor. The bulletin states that for a woman 4 feet 10 inches tall the working surface or bottom of sink should be 30¾ inches; 5 feet 5 inches, 34½ inches; 5 feet 7 inches, 35 inches; 5 feet 10 inches, 37 inches."

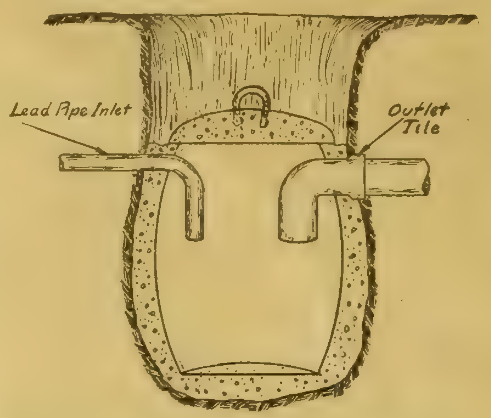
"I reckon that it would have to be about 35 inches from the floor for mother," mused Mr. Baxter. "She is about 5 feet 7."

Dan could see that his father was very interested as he did not notice when the clock struck nine, which was his bedtime. Urging Dan to go on he reached for his pipe.

"Read about the installing," he said settling himself back in his chair.

" 'First'," read Dan, " 'after the location of the sink has been decided upon, measure up from the floor the proper height for bottom of the sink or working surface, then add five inches for the depth of the sink. Draw a level line on the wall at this point.

" 'A sink may be attached to the wall either with sink brackets or a sink yoke or frame. The yoke is stronger and more easily put up although more expensive. The brackets or yoke should be attached to the wall with their top edge even with the line and spaced far enough apart to receive the rim of the sink. If the sink has a back attached, special brackets are sometimes provided for attaching to the wall.



Sink water should not be merely run out on the surface. It soon becomes unsightly, ill-smelling, and a harbor for flies. Since the sink water does not contain much solid matter, it can usually be disposed of very readily by fairly simple methods. Owing to the grease which is generally present in waste water, it should not be run directly into a tile drain, whether this line runs into the farm drainage system or is merely a short line running away from the house. If the waste water is first run through an easily constructed grease trap, the grease will be separated so that the water can pass out into a tile system without danger of clogging.

" 'Either lead or iron piping may be used to carry the waste water. When ordering sinks, fittings can be secured for attaching either lead or iron pipe. For a simple installation lead pipe should be used, as practically no special tools are required.

" 'Secure a piece of 1½ inch lead pipe long enough to reach from the sink to the floor and through the wall into the grease trap. The pipe can be bent readily to proper shape. If the bends are sharp, the pipe should be filled with fine sand to prevent flattening and heated slightly on the side that will be stretched.

" 'Where the sink is attached to the outside wall, and with the grease trap directly outside the house, no trap will be required below the sink, as the immersion of the waste pipe into the liquid in the grease trap prevents the gasses from coming back. On long lines of waste pipe a trap is recommended.

" 'If quite a large hole is made in the wall, the pipe may be inserted from the outside and slowly bent to enter a hole made in the floor directly beneath the strainer in the sink. When the pipe is about one foot above the kitchen floor remove the pipe clamp from the sink and slip it over the end of the pipe. With a round stick or ball pein hammer flange over the end of the end of the pipe until it fits the pipe clamp; then cover the flanged end with a layer of putty and bolt to the sink. If the hole through the floor has not been neatly made a ring or collar can be secured to fit the pipe closely and cover any irregularities.

(Continued on Page 19)

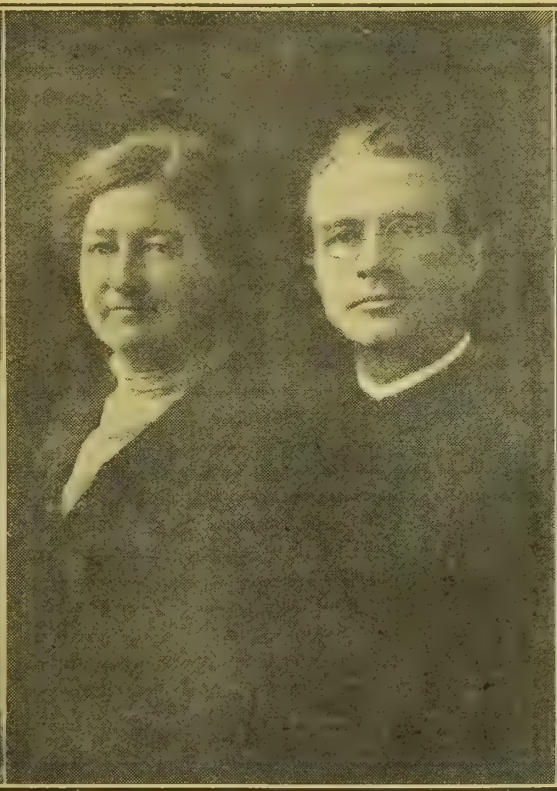
What woman wouldn't be pleased to have her kitchen arranged like the above? The sink is located directly under a window so that light is ample making working conditions better and the sink more sanitary. On the right of the sink is a large drain board while to the left are built-in cupboards and a flat top cabinet. In this kitchen one would have to take only a very few steps in preparing a meal. Notice there is no pail for sewage in this case. A tile drain takes care of the waste water.

PICTURES FROM FAR AND NEAR

GETTING ALONG NICELY, THANK YOU.—For the first time in ten years, a baby camel, born in New York, has lived over the critical age of the first two or three weeks. Here is the newest addition to the Central Park Zoo, New York City, a baby camel, three weeks old, with its mother and the keeper.

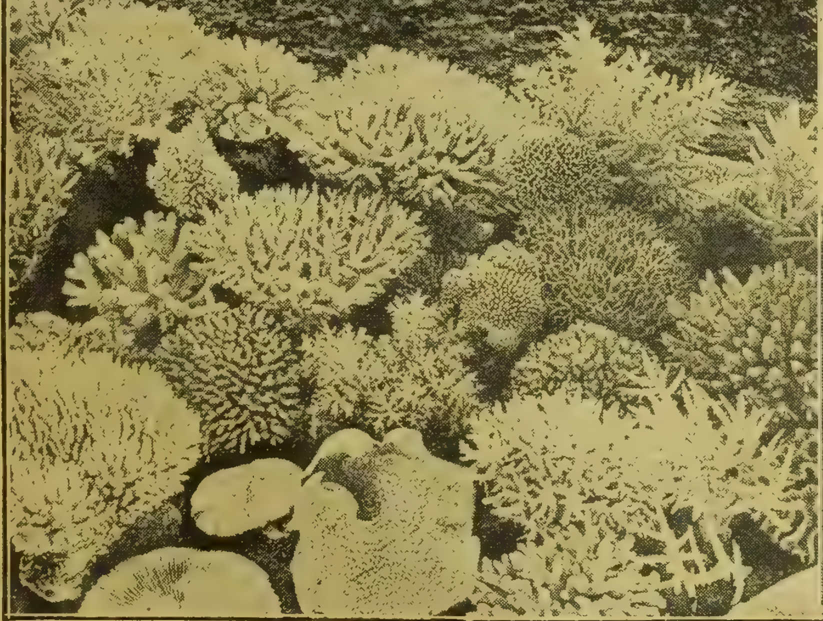
EUROPEAN MIDGETS VISIT THE NATIONAL CAPITOL AND INSPECT THE FIRE DEPARTMENT.—Midgets from all parts of Europe who arrived in Washington inspect the Fire Department and demonstrate to the Chief their ability to do big things. Photo shows a group of midgets who have donned firemen's hats already for action.

RIVALS QUEEN OF SHEBA IN SPLENDOR.—Eleanor Boardman, of the movies, wears here a headdress of glycerined octrich and cross aigrettes, with a bandeaux studded with rhinestones and pearls. It is valued at $600 and in a forthcoming production Miss Boardman will ruin it by jump-overboard while wearing it.

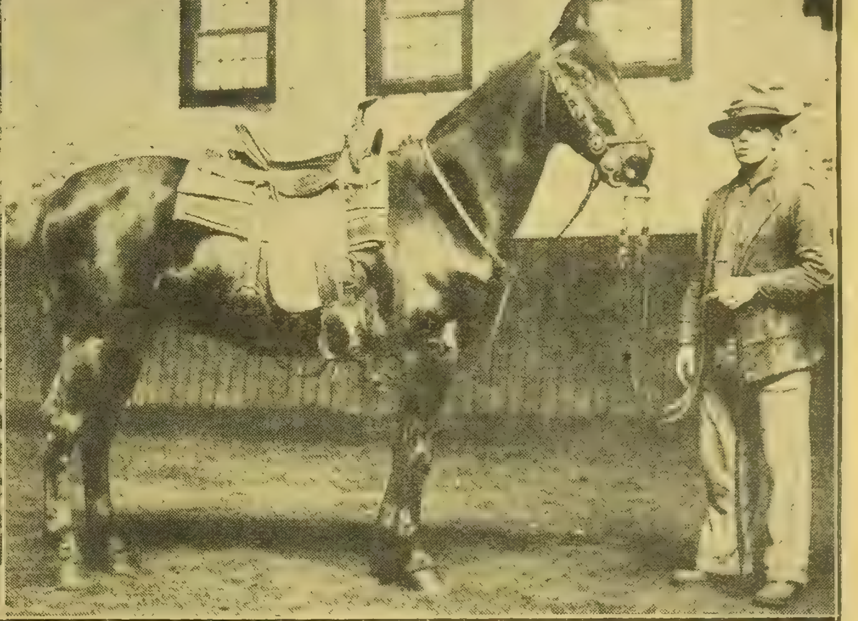


70,000 FAMILIES IN HIS CONGREGATION—You can imagine how big a church it would take to hold them all. Yet Rev. David F. Warner has assumed the pastorate of The Business Farmer's congregation and you will find his first sermon on page 11 of this very issue. Rev. Warner is here shown with his good wife and help-mate.

EASY TO MAKE MONEY, SAYS HE.—Lord Leverhulme, English soap magnate claims that it is the simplest thing in the world to make 100,000 pounds or twice that sum. But absent-mindedly he has forgotten to add the recipe for amassing such a sum. He considers Henry Ford the leading member of the "Make Money Club."



IN NATURE'S UNDER-SEA GARDEN.—These look like so many flowers, but in reality they are just some very pretty specimens of coral. This picture was made, with difficulty, under-seas, off the coast of North Queensland, Australia and the coral is much in demand throughout the world.



QUITE AN EXPENSIVE SEAT.—Would you pay $600 for a seat? Well, that is what this saddle and bridle cost. It is German Silver mounted and is very rare, both for its price and its unique service. The horse is named "Peg" and is the property of Capt. P. C. Lewis of Troop A, 110th Cavalry.

Get the Best Jobs

You run a threshing outfit to make money. To do that you must get the best and largest jobs. To get the best jobs you must have an outfit that can do the very best of work—that can thresh most, save most and run the steadiest. The

Red River Special

will do all that. Its Big Cylinder, "Man Behind the Gun," Beating Shakers, Graduated Adjustable Chaffer, and sturdy construction make it the most effective thresher and the most profitable one.

It saves the Farmer's thresh bill by saving enough more of his time and grain.

It does such good work and threshes so well when conditions are bad that the best and biggest jobs wait for it.

And the man who owns it makes the most money because it gets those jobs.

Built in both wood and steel. A size for every need.

TREE SURGERY

In our cemetery we have many beautiful shade and ornamental trees. During the past summer many of the trees all of the silver-leaf maples were badly injured by the bark cracking, on some trees from the ground to the lower limbs a distance of four or five feet. The insects had entered and the trees were in great danger of being ruined. We had all foreign and dead bark cut away and the wounds painted. Did we apply the proper remedy or what should be done where the bark is injured by being broken or torn away? We would like some information relative to tree surgery, if you would kindly direct us where to get it.—Mrs. E. A. N., Kingsley, Mich.

—The damage to the silver maples is probably the result of sun scorch or as it is sometimes called, sun scald. This damage is quite common on smooth barked trees, especially on those portions of the trunk which for some reason, such as pruning or the removal of neighboring trees or shrubs are suddenly exposed to direct sunlight. It occurs often on trees which have been recently planted and where the crown is not sufficiently developed to shade the stem of the tree or where there is reflected light from some cause as well as direct light from the sun. It occurs only on the southwest side of the tree and if the injury is on some other side it was caused by another agency. Such damage can only be prevented by shading the stems of the trees which seem susceptable. this can be done by tying burlap or some other material around the stem of the tree.

After such injury has occurred, or any similiar injury, all injured bark and decayed wood underneath should be removed and the wound painted with lead paint or better still with creosote in order to prevent infection. You could obtain a bulletin on tree repair by writing to the Forestry Department of the Michigan Agricultural College, East Lansing, Michigan.—A. K. Chittenden, Professor of Forestry, M. A. C.

FENCE VIEWERS

I have no law book and will ask where and how the fence viewers are obtainable or where I can get them. I also would like to know how to collect damages for neglect on live stock.—N. A. A., Leroy, Mich.

—The highway overseers and highway commissioner are fence viewers in each twonship. When any controversary arises between occupants of adjacent farms over a partition fence, it is their duty to view fences and determine the rights of the respective parties. When cattle break through a partition fence and damage the adjoining land owner, he may bring an action of trespess for such damage provided he has kept in good condition his share of the fence.—Asst. Legal Editor.

DO NOT DESTROY TREES OR SHRUBS ALONG HIGHWAY

I own a farm along state trunk line and brush has not been kept cut along same as I moved here a short time ago. I wish to clean up along the road, but have been told it is against the law to cut brush along trunk line as it is to remain for shrubbery. Please let me know is there any such law in Michigan, when passed and what is the penalty for same?—P. K., Lowell, Mich.

—I call your attention to Act 2 of the First extra session, Public Acts of 1921, which reads in part as follows:

"It shall be unlawful to cut, destroy or otherwise injure any shade or ornamental tree or shrub growing within the limits of any public highway within the state of Michigan without the consent of the authorities having jurisdiction over such road."

The purpose of this legislature is for the advancement of roadsire development as well as for the protection of the highways by the preservation and planting of shade trees therein and before a property owner would be authorized in cutting or removing trees or shrubs, he should make application to the authorities having jurisdiction over the highways who will grant the permit to remove such trees or shrubs as do not materially benefit such highway.

On country roads property should apply to the Board of county Road Commissioners, on township highways to the township highway commissioner and the township board and on trunk line highways and federal aid roads, application should be made to the State Highway Commissioner.

The penalty for violation of the above cited act is a fine of not to exceed $100.00 or imprisonment in the county jail not to exceed 30 days or both such fine and imprisonment.—H. H. Portlaw, Legal Advisor, State Highway Dept.

CAN AGENT COLLECT COMMISSION?

I have a question I would like to have answered in your next issue if possible. If I give a real estate man the exclusive right to sell my farm for a certain length of time, and during that time another real estate man sells said farm, can both collect commission? Or if I sell said farm myself, can either real estate agent collect?—L. McC., Croswell, Mich.

—Only the man who sells your farm can collect commissions, and if you sold it yourself, neither can collect. However, if you made a contract with a real estate agent, giving him the exclusive right to sell the farm, and then breached that contract before its termination by employing another to make the sale, or selling it yourself, you would be liable to him for any damages he may have suffered by reason of your breach of contract.—Asst. Legal Editor.

PLANNING A LIVESTOCK LEASE

Will you kindly suggest an outline for a lease where the landlord furnishes the cows, brood sows and poultry, and the necessary feed until more is grown? The tenant is to furnish horses, machinery and all help. Who should furnish the seed? How should threshing and silo filling bills be divided? Who should pay the personal property tax and the insurance?—G. C., Saginaw County.

—It would seem that the ordinary half and half livestock lease would be best adapted to your case. Under this arrangement, the landlord and tenant usually own the cattle, hogs, feed and seed in partnership. The tenant furnishes the horses, machinery and labor. In your case the tenant could buy a half interest in the cattle, hogs, feed and seed, and if he has not the ready money, could give you his note secured by chattel mortgage on his share of the goods and on his half of the crop. Usually the tenant is allowed to keep up to one hundred hens and to raise sufficient chickens to maintain the flock and have the product for his own, but sometimes the poultry is included in the partnership. Most tenants will not give much attention to poultry if the product must be divided with the landlord. All sales are divided half and half. If dairying is the principal source of income, or if the farm is rather run down, the landlord may find it necessary to furnish all the cows in order to keep a good tenant on this basis. The idea is that if the tenant is required to increase his labor bill in order to milk a large number of cows, the landlord should do something to offset this extra contribution of the tenant. Such bills as threshing, twine and rent of machinery for silo filling are divided half and half. Each party ordinarily pays the personal tax and insurance on his own property. Taxes and insurance on company property are divided half and half The landlord usually furnishes all the grass seed, altho on a long-term lease, this may be divided.

OFFICERS WHO ENFORCE PROHIBITION LAW

Some months ago you published in your paper particulars in regard to conducting an investigation of the prohibition law. We have altogether too much of it in this county. Please give me the name and address of the one whom it is necessary to inform.—Subscriber, Kalkaska, Mich.

—An investigation in regard to the violation of the prohibition law can be conducted: (1) By any private citizen who could report the result of his investigation to the law-enforcing officers; (2) by the law-enforcing officers of any city or village; (3) by the law enforcing officers of the county; (4) by the law-enforcing officers of the state, including the State Police, and (5) by the law inforcing officers of the Federal Government.

Whether or not there is too much investigation of violations of the Prohibition Law is of course a matter of opinion and should any citizen want such investigations discontinued, I should judge he would have to take it up with the different classes of law-enforcing officers, above mentioned.—Charles J. DeLand, Secretary of State.

C LIABLE FOR RENT

A sells 40 acres to B on contract. B makes small payment down and is to make another of $500.00 first of January, 1923, to gain full possession at that time. He fails to meet the second payment. B rents some land to C for wheat shortly after purchase. Can C hold wheat as per agreement?—C. E., Williamston, Mich.

—If C has leased the farm from B as purchaser under a land contract, and through no fault of C's the estate of B is terminated by B's forfeiture, thus terminating the lease, C has a right to cultivate and harvest the crops which he has planted while the lease was in effect, being liable to the vendor under the land contract for rent according to the terms of the lease.—Ass't. Legal Editor.

MICHIGAN CROPS

RAISING MORE AND BETTER POTATOES

In a recent issue, you had an article, entitled "More and Better Potatoes to the Acre," by E. Sutton. I do wish you could get him to give a detailed article on how he raised them, how deep he plowed, and when, what kind of fertilizer, and how put in. How many eyes he aimed to put in a hill, and everything connected with the growing of potatoes, including spraying and cultivating, also if ground was plowed in fall or spring. Would certainly be pleased to see an article of this kind in your paper.—R. G. H., Berrien Springs, Mich.

—The raising of potatoes is getting to be more of a problem each year. Farmers are awakening to the fact that ignorance along this line is keeping them back. But it also makes them work harder with less results.

I am passing along my ideas of raising better potatoes. Beginning with what I consider the very first step, namely, a good clover sod. This I manure thoroughly with a spreader using 20 to 30 loads to the acre.

If I am in a position to do so I put the manure on the year before, or as early in the spring as we can get on the ground. This should lay on the ground 2 or 3 weeks before plowing or until the rains have soaked it well into the soil.

I plow at least 8 inches deep dragging it lightly before quitting time each night. On this I sow commercial fertilizer, broadcast or with grain drill, working it thoroughly into the soil using ½ to 1 ton per acre. I use 0-10-5, 0-10-10, or 2-10-5. This I drag once a week good and deep until planting time.

We have tried fertilizer both in the row and broadcast and have had better results with the latter especially if it happens to be a dry season. If the acreage is small I prefer them rowed both ways. About 28 or 30 inches each way. This year I intend to put mine 24 by 28 inches to keep them from growing too large.

Good seed and spraying are essential. I select disease free Russett Rural potatoes. Cut them in blocky pieces, weighing not less than 2 ounces and having at least 2 eyes to the piece.

In spraying we use a power sprayer. Three nozzles to the row and 200 pounds pressure. We begin spraying when the vines are 6 inches high, continuing about every 10 days until we have at least sprayed them 5 times. When spraying for bugs we mix Arsenate of Lead with bordeau doing both jobs at once. The first couple of times cultivating I cultivate deep to loosen the soil, after that I cultivate shallow and level, keeping away from the plants.

In the Business Farmer of March 31st we were interested in the article "Shall We Plant Our Potatoes Earlier." The writer's idea might be all right for his particular locality, but as we live in Antrim county, near the lakes, where we have cool nights with a good amount of rainfall and are not bothered by frosts, we do not exactly agree with him. Our experience has been that if we plant before the 10th of June, about 4 years out of 5 we have a dry spell and it is sure to shorten the crop. We have raised potatoes planted as late as the 19th of June that were thoroughly ripened and taken care of before the frost came. Our season is shorter but potatoes grow faster than further south.

We treat our seed then green sprout them. We spread them very thin on the floor so that light gets to every potato and leave them from 4 to 6 weeks. By doing this we have stronger vines and they come up from a week to 10 days earlier.

We like to cut our seed about two days ahead of planting, but if this is not possible we use dry sulphur to heal them over quicker and make them better to handle.—E. Sutton.

TREAT SEED CORN WITH COAL TAR

Can I put anything on my seed corn before planting it to prevent crows pulling it up? I read in one of the papers last year where a man stated he had treated his seed with Creso Dip No. 2 and the crows did not pull up his corn. Do you think this would stop them? Is there any other remedy? How many pecks of white navy beans will it take to plant an acre of ground, rows 3 ft. apart and 18 inches apart in rows, or would 32 in. be wide enough between rows? I would plant 7 to 10 beans in a hill.—H. S. Whitmore, Mich.

—The coal tar treatment is one of the most effective for treating seed corn to prevent crows from pulling it up. This treatment is an old one and has been proved by years of use in Michigan. Several days before planting, the seed corn should be shelled and graded. The corn to be treated is moistened for ten minutes in lukewarm water. The water is then drained and coal tar applied at the rate of two tablespoonsful to a bushel of seed corn or one teaspoonful per peck. The coal tar is stirred thoroughly through the moistened corn until the kernels are evenly coated with a thin film. The corn is then spread out thinly on a floor or table to dry.

Creso is a coal tar product, and hence commercial Creso Dip is also effective.

From fourteen to sixteen quarts of beans are required to plant an acre of ground—rows 3 ft. apart, hills 18 inches apart, 7 to 10 beans per hill. On ground of average or better fertility you will get a larger yield by planting in rows thirty-two inches apart, in which case sixteen to eighteen quarts would be needed per acre.

Our experiments at M. A. C. show that on land of good fertility highest yields are secured by planting in rows twenty-eight inches apart, using from twenty to twenty-four quarts of seed per acre.—J. F. Cox, Professor of Farm Crops, M. A. C.

TREATING SEED POTATOES

I would like to know if you would advocate filling a silo with stover silage. We do not know what to do; buy a new ensilage cutter or put the silo filling attachment on our McCormick husker and take out all the corn. Does stover ensilage keep well and how do you take care of corn so it does not spoil? Will you please tell me just how to treat seed potatoes with Corrosive Sublimate? I would like to try mine this spring. —W. S., Lansing, Mich.

—Recent experiments at M. A. C., conducted by the Department of Animal Husbandry, show that stover ensilage is much less efficient for fattening steers than ensilage made from corn stalks carrying the ear at the proper stage of maturity. Stover ensilage will keep as well as ensilage made from the entire corn plant if properly packed in the silo and if sufficient water is added. It is usually in a more advanced stage of maturity and hence dryer. The addition of sufficient water when filling the silo will insure the proper keeping of stover ensilage. A larger amount of purchased concentrated feeds must be fed with stover ensilage than with ensilage made from the whole corn plant.

The following method of treating seed potatoes with Corrosive Sublimate is given in Experiment Station Bulletin No. 117:

Seed potatoes should be carefully graded and all ill-shaped, mechanically injured, and partially rotted tubers should be removed before the seed is put in the disinfecting solution. Potatoes should be comparatively free from dirt before they are treated. Potatoes should be treated while they are dormant and before they are cut. Soak the potatoes for 30 minutes in a solution of corrosive sublimate (Bichloride of mercury), the strength of which is 4 ounces of corrosive sublimate to 30 gallons of water.

Dissolve the 4 ounces of corrosive sublimate crystals in 2 quarts or so of hot water, and then add it to the 30 gallons of unheated water. Corrosive sublimate corrodes metals. It should be used in wooden vessels. A 50 gallon wooden barrel is a satisfactory container in which to soak the potatoes. By using two or more barrels, a large quantity of potatoes can be treated in a day.

Where 100 bushels or more of potatoes are to be treated, the work can be done conviently if a wooden trough or tank that will hold 8 or 12 potato crates is used. The potatoes in bushel crates are immersed in the corrosive sublimate solution. The tank can be made water tight by lining it with canvas and giving the canvas a coat or two of asphaltum paint.

The corrosive sublimate loses its strength with use, because the potatoes and dirt condense and chemical and take it out of solution. From one-tenth to one-fourth of the corrosive sublimate is removed with each batch of potatoes treated. The treating solution can be kept at the proper strength by adding corrosive sublimate from time to time. If the potatoes are placed in the solution loose and are comparatively free from dirt, add one ounce of corrosive sublimate dissolved in one quart of hot water for each 30 gallons of liquid after each second batch is treated.

If the potatoes are dirty and are treated in bags, add one ounce of corrosive sublimate for each 30 gallons of liquid after each batch is treated. When the treating solution gets very dirty, discard it and make up a fresh solution. One pound of corrosive sublimate will treat from 30 to 60 bushels of potatoes.

Corrosive sublimate is a deadly internal poison. Do not pour the solution where livestock or poultry can get at it, and do not use treated potatoes for eating purposes.

After the potatoes have been taken out of the solution they should be spread in a cool, shady place and allowed to dry thoroughly. It is a good plan to soak the bags or crates used for handling the treated seed in the corrosive sublimate solution in order to prevent any possible reinfection.—J. F. Cox, Professor of Farm Crops, M. A. C.

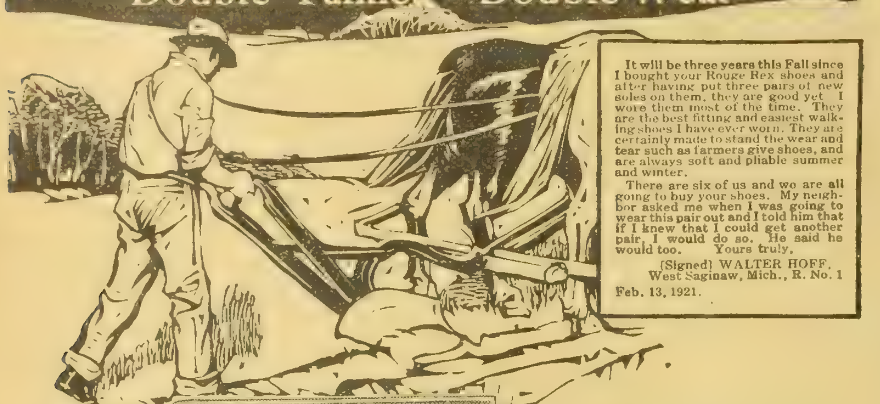
ROUGE REX

More Mileage Shoes

Double-Tanned—Double Wear



It will be three years this Fall since I bought your Rouge Rex shoes and after having put three pairs of new soles on them, they are good yet. I wore them most of the time. They are the best fitting and easiest walking shoes I have ever worn. They are certainly made to stand the wear and tear such as farmers give shoes, and are always soft and pliable summer and winter.

There are six of us and we are all going to buy your shoes. My neighbor asked me when I was going to wear this pair out and I told him that if I knew that I could get another pair, I would do so. He said he would too. Yours truly,

(Signed) WALTER HOFF,
West Saginaw, Mich., R. No. 1

Feb. 13, 1921.

The Plowboy

For plowing here's the shoe. High enough to keep out dirt, low enough for coolness. It fits snug and protects and supports the ankles going over rough, broken ground. And it wears like iron.

Ask for Stock Nos. 470 and 446

It Wears 1000 Miles

and it *stays* soft—rain or shine

We are exclusive makers of work shoes made of horsehide double-tanned by our own secret process.

This is our specialty. Our every energy is bent on making the world's strongest work shoes. To insure the best wearing leather we do our own tanning, in our own specialized tanneries. We tan horsehide, and it is known as the toughest fibre leather on earth, yet we make it soft and pliable as buckskin. Horsehide is used to cover league baseballs because it is the only leather tough enough to stand the pounding.

And it stays soft when double tanned our way. When other leathers get wet they dry out hard. Rouge Rex double-tanned horsehide stays soft. Wet it, soak it in water, snow, slush, mud, and it dries out soft and flexible as velvet. Wear Rouge Rex shoes and you'll say you have gained an entirely new conception of shoe service, endurance and comfort.

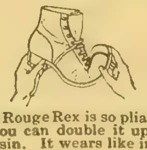
We are the largest tanners of horsehides for work shoes in the country. We buy only the choicest hides. In making Rouge Rex shoes, we use only the strongest part of each hide — the butts, where the fibre is toughest and most enduring.

You'll say that Rouge Rex Shoes are the most economical shoes you ever owned, and you'll rejoice in the comfort they give you. Notice how thick the leather is, and then feel how soft it is. Just like velvet. Yet Rouge Rex wear like iron. And they never tire your feet.

We make a Rouge Rex work shoe for every purpose. All are horsehide through and through. For field and factory, for lumber and mining camp or oil fields, for hunting and motoring, where a husky, hard-wearing, comfort-giving shoe is needed, there is a special Rouge Rex shoe.

If your dealer hasn't the Rouge Rex we'll see that you are supplied them by our nearest dealer. Write to us for catalog.

Rouge Rex Comfort Shoe



This Rouge Rex is so pliable and soft you can double it up like a moccasin. It wears like iron but you'll hardly know you have a shoe on, it is so soft and easy.

For tender feet, or where you do not encounter wet weather, wear this Comfort Shoe. You'll find it a blessing to the feet.

The Truth About Henry Ford

By Sarah T. Bushnell

COPYRIGHT BY REILLY & LEE COMPANY)

The Conclusion

FOR five years foreign-born laborors have received diplomas symbolic of nine months training in citizen-making. I sought a man to whom Mr. Ford had said: "The Bible is the most valuable book in the world. If it could be written in the language of today, I would scatter a million copies among the people who never read it and who fail to grasp its worth and beauty." I asked this man, Mr. Brownell, this question: "How has this great millionaire made the educational department of this plant the very dyna mo of its success, and why has he given a clergyman such wide and sweeping power?

Mr. Brownell took off his glasses and laid them carefully on the desk. "He does it by dispensing practical Christianity, interpreted through dollars and cents; in the sharing of profits with employees; in opening the doors of employment to maimed and crippled men, and to men who have unfortunately run into debt to society, but who have paid such debts in full. His has been the humane recognition that all men are of common clay and that all, barring none, are entitled to a helping hand.

"You shall meet Dean Marquis, head of the educational department, and Mr. DeWitt, head of the English school, which should really be called the American school, for its scholars are from fifty-eight countries and they speak one hundred different dialects. They have been taught one language and have been trained to become citizens of our own American nation. But first let me tell you an incident that will illustrate how men have been reclaimed in this factory.

"One cold night in December an official of the company was called to the front door of his house. Outside was the half-wreck of a man, who plunged into complaint without formality. 'They say Henry Ford gives the fellow who is down and out a chance—that he thinks there is some good in the worst of us, but it is a lie—a black, barefaced lie. I have stood in line at his plant trying to get work and never have been given a look-in. I'm at the end of my rope and I've got to go back to my old ways.'

"The conpany official interrupted him. 'Mr. Ford wants to give every man who deserves it a chance,' he said. The other man shivered. 'Ever since they turned me loose, two years ago, I've tried to go straight, and every time I get a job a dick passes the word and I'm fired. If I can't get steady work I'll have to be a crook again. To-night they——"

" 'Don't worry about tonight,' the company official told him; 'come to the factory tomorrow and a place will be found for you. We have more than five hundred men who have served penitentiary sentences and only two of them have disappointed us. When you begin work no one will be against you so long as you do what is right.' "

Somewhere in that great factory that man made good and he is still working there.

The probation period, formerly six months, has been reduced to thirty days, the minimum salary raised from five to six dollars a day. There has been no strikes nor is there any labor discontent. The power of discharge has been taken out of the hands of superintendents and foremen. They can discharge from their departments, but not from the factory. The employment office investigates and places the laborer in that other department to which he is better adapted.

The Educational Department, through the advisors, or helpers, has a record of the living conditions of each employe. They know his habits, good or bad. They know what money he has saved, if any. They know what insurance he carries. They consult with him as to his bank savings. They have taught him how and why to save. In rare cases they have moved his family to Detroit and provided a home in which to shelter them. There is nothing of the spy or detective methods in their visits. They go in the spirit of helpfulness and interest. They teach the employee hygienic living and how to buy food. While teaching him how to earn money they also teach him—which is more important—how to spend it. They have taught him that debt is the result of poor management or misfortune.

Take for example the case of an employee who wages were garnisheed month after month. He was industrious and hard-working; the bills were not of his making. An advisor was sent to his home. He met the wife, a nice little woman who believed in a happy-go-lucky existance, and who made expenditures out of all keeping with her husbands salary. That she was a woman of sense was proven when she grasped the idea that this sort of thing could not continue. A scientific housekeeper was sent to instruct her in up-to-date economics. She welcomed the suggestions made. To-day the bills are paid, the man and his wife own their home and have money in the bank.

There is another rule on which the cornerstone of right living must be laid—an employe, if it be thought justifiable, is required to produce his marriage license. No recognition is given socialism or free love. This is mentioned because a case of this sort was recently made an issue. An important ruling of the Ford company in 1913 covers such questions.

The legal department aids the workers by examining deeds to property they wish to buy, assessing its value and passing on the validity of the contracts.

In the Ford English school are natives of Arabia, Persia, India, Poland, Armenia, Turkey, Chaldea, Albania, Serbia, Korea, Macedonia and other innermost parts of Asia, Europe and obscure regions of the world. Each of these foreigners speaks two or more dialects, but has no knowledge of our own language. They are taught reading, writing, arithmetic and grammar according to the modernized methods of Francois Guoin, who lived in 1710. The everyday problems of life are the keynote of each lesson, and a new psychology of good fellowship and interest accents the instruction. Mr. DeWitt was recently borrowed by Pennsylvania to demonstrate to the teachers of that state his original experiments. Mr. Ford watches the lessons. The one on birds, which emphasizes the great American bird, the soaring eagle, the emblem of freedom, is his favorite. There are other lessons which Mr. Ford personally supervises—for this department is the child of his brain and is dear to his heart. The foreigners are taught cleanliness, table manners, courtesy in public places and also, when possible, they are instructed in gardening. As an evidence of the eager earnestness of the pupils the case may be cited of a Macedonian who learned the Constitution of the United States verbatim in four days.

The nine months' course has been turning out annually between three and six thousand graduates. The diplomas, signed by Henry Ford, Dean Marquis and Mr. DeWitt, state that "the holder has been given ground work in English which enables him to write it and to read it within certain limitations. It gives him a definite comprehension of the rudiments of government, national, state and municipal, and fits him to become a citizen of the United States and to understand the obligations thereof."

The day war was declared Mr. Ford instructed the chief of his medical staff to ascertain accurately the exact number of positions that might be filled with disabled soldiers. **Every** wheel and cog of the factory was devoted to winning the war, and openings have been made for those who served. Dr. Mead reported that four thousand maimed and injured could be used. The factory was then using thirty-seven deaf men, two hundred and seven civilians blinded in one eye, sixteen who were deaf and dumb, and one totally blind. Before peace was signed the Ford factory had employed seven hundred and eighty-three disabled soldiers. Positions have been given to five thousand four hundred and eighty returned soldiers and sailors, and more are constantly being added. Direct instructions have been issued that soldiers are to be given preference over all other applicants.

A great problem in every factory is tuberculosis. It has been demonstrated in the salvaging section that tubercular patients are as productive as any other class of workmen. Hospital treatment is given free. The state law of conpensation allows ten dollars weekly to a bedridden man; the Ford company gives eighteen to twenty dollars. Mr. Ford believes that regular wages and light work will drive away worry and expedite a man's recovery. Hence handiwork is taken each day to patients able to sit up, and they are enabled to earn full wages.

Just as he conceived the perfection of his tractor while on a vacation by watching the movement of a horse's legs, so Mr. Ford's mind reaches out to help humantiy. Indifferent to the usual hobbies and amusements of men of the world, he has his own interests and recreations. He believes in practicing the gospel, "Give a man the chance he deserves, not charity." The following incident is so unusual as to seem improbable, yet it is true. As Mr. Ford was driving one day he passed a much be-draggled tramp to whom he gave a lift. The tramp claimed to be penniless and without work, and for that reason was walking to his sister's home in Connecticut. The next day he was given a position in the Ford plant. The employment office was instructed to equip him with the necessary clothes and report his progress to the office. All moved smoothly for a while, but, unlike the usual fairy tale, the end of the month found a restless worker instead of a diligent one. He was moved to another department, but when pay day came his restlessness had grown to loud protests, and to Mr. Ford was brought the news that wanderlust was beckoning his protege, who had threatened to quit.

"What's this I hear?" asked Mr. Ford when the prodigal came to his office. Into his ear was poured, forthwith, a story of homesick yearning for the far-away sister that would have done credit to an expert. Mr. Ford listened patiently. "See here, Bill," he said then, "you have no idea of going to Connecticut. You want to quit so that you can be a plain shiftless tramp."

The ex-hobo studied the carpet.

"Yes, that was it," he admitted. "A factory is no place for me; I'm lazy. I've lived the old life so long that I like it."

"All right," said Mr. Ford, "You can quit. I've told them not to bother with you any longer. But remember one thing, I am not going to let you slip back into your old ways. I'm going to employ a man to follow you everywhere you go and watch everything you do. If you ever feel sorry for the way you have treated me you can come back to your old place, provided you are willing to work. Until you do I am going to watch you every minute. Perhaps you will decide to brace up and be a man."

"Gosh," said the surprised man. "If you are going to do that I might as well give in right now."

This ex-tramp is now a faithful worker. Again the theory succeeded.

The next five years will witness the most important readjustment period in our national history. It will be a time when capital and labor must throw off their shackles and meet on a middle ground of consideration, each recognizing the rights of the other. Organized labor will have to make great concessions. Capital will have to make even greater concessions. Neither group can strangle the other if the principles for which our boys fought and died are to survive. Is it right that the soldiers who fought to save this country be assailed by food profiteers, by rent pirateers, by selfish capitalists and dictated to by labor organizations? What is to be the ideal solution? Will practical education be incorporated into the new order of American industry? Is real Americanism to be the foundation stone of the nation, or will the

Make the First Cost the Only Cost

The value of a good silo reaches its greatest height in a Kalamazoo Glazed Tile Silo because the superior quality of Kalamazoo Tile means perfect ensilage. Stock raising and dairying are by far the most profitable types of farming, and silage is unquestionably the most economical feed for livestock and dairy cattle.

Kalamazoo Tile and Wood Silos

Our Glazed Tile silos are everlasting—decay-proof, storm-proof, vermin-proof; will not burn or blow down; save repair and paint bills. Three dead air spaces make perfect insulation against cold, heat, dampness. Kalamazoo Tile is made from selected quality clay in our own plant located in the center of the finest tile clay district. Our Wood Stave Silos have stood the test of thirty years. We are America's pioneer silo builders. All Kalamazoo Silos are fitted with continuous door frames of galvanized angle steel. Send for free book of silo information.

Uncle Rube Spinach Says:

WHAT "THEY" SAY

SAY! Do you know that 'bout the biggest fam'ly of busy body's this world has ever known is "They," an' what "They" say, an't what "They" think, causes us human bein's more misery an' more troubles than most any other thing on earth. What "They" will say or what "They" will think, sometimes—not often—makes people do good deeds, not 'cause its in 'em partic'larly to do it, but 'cause they are afear'd of the "They" fam'ly an' what they'd think. An' on the other hand the same bunch of "They's" keep us from doin' the things we know to be right. If we have done wrong—have gone the fast pace an' wish to turn about an' go right—if we would like to go to church or do good deeds, would like to help our fellows an' try an' be somebody, we are quite often held back by the fear of what "They" would say if we suddenly changed our ways an' tried to make good.

What "They" would say has separated many fam'lies an' has kept fam'lies apart when they wanted to get back together again. The fear of what "They" would say has kept young couples from gettin' married an' has caused marriages where none should have occurred. The "They" bunch, an invisible group of nothing, is the foundation of nine or ten tenths of all the good an' all the evil that has ever come into our lives.

The fear of what "They" would say has made thieves of honest men —men who on account of this fear have tried to live way beyond their means to keep up appearances; an' has caused thieves to become honest —not often the latter case, but many of the first. The fear of what "They" would say has kept many preachers from preachin' the Gospel as God would have 'em preach it. It has kept men from tellin' the truth; has made liars of otherwise honest men; has kept women from goin' wrong an' saved men from temptation. What "They" would say has more to do with the runnin' of our gover'ment then almost any other thing I know.

There ain't hardly a thing we can think of but what "They" take an important part. I know of fam'lies that have been sep'rated for some time—mebbe through drink, mebbe jealousy, mebbe something else—any way the cause has been removed, but yet they are kept apart on 'count of what "They" would say if the fam'lies should be reunited.

Men an' women have been sent to prison—or have escaped just punishment, because the judge an' jury wuz afraid of what "They" would say if things went diff'rent. Ah, the "They" fam'ly sure is numerous as the sands of the sea an' jest 'bout as treach'rous. "They" smile at us today and curse us tomorrow. We are all, slaves of the fam'ly known as "They." An' really now, who an' what is this—Well—who are "They?" "They" are just an imaginary thing—a nothing, 'cept what we, in our ignorance, conjure up in our own mind. What "They" say 'bout us, what "They do, makes no real difference to us—can not change our lives only as we let this bogey-man sway us.

What "They" say makes no diff'rence to me—my life is my own—mine to live as I think best. Your life belongs to you—"They" cannot make nor break you, nor I. If we do a wrong thing "They" don't have to tell us—our own conscience tells us an' yet "They" are the things we fear more than most anything else in all the world.

Let 'us forget all about the little thing called "They." Let's jest be our own self, doing the best we know how. If we are sep'rated from those we love an' are bein' kept apart on account of what "They" might say, let us be good forgetters. Let's forget there is any such thing as a "They" fam'ly an' jest get together on our own occount—let us be ourself regardless —kiss an' make up. Make things right between us. "They" are small pumpkins compared to real happiness an' what "They" say can't make a bit of diff'rence if we jest for get that any such thing as a "They" fam'ly exists.

What "They" say an' what "They" think, makes no partic'lar diff'rence to me if I really think I'm right, an' if "They" or any of the "They" relation are keepin' you from happiness jest forget the whole tribe an' be happy in spite of 'em. Cordially yours, UNCLE RUBE.

FARM MECHANICS

THE SLUMP TEST

DO you know that the Slump Test is the simplest and most practical way of detremining the proper amount of water to use in mixing concrete?

The correct cement-water ratio for any concrete mixture will develop the maximum strength of the concrete. A knowledge of how to determine this ratio is a matter of importance to the builder.

The slump test is a simple, easy, and practical method of making this determination. The only apparatus necessary is a special mould, made from sheet metal, preferably noncorrosive. in the form of a frustum of a cone 4 inches in diameter at the top, 8 inches in diameter at the bottom, and 12 inches in vertical height.

After thorough mixing the concrete is placed in the mould in three or four successive layers, each layer carefully puddled or rammed with a blunt-pointed 5-8-inch round rod. The metal mould is then removed with a steady, vertical lift, leaving the concrete free to spread at the base. The "slump," or reduction in vertical height of the pile of concrete which results, is an indication of the consistency of the mixture.

The consistency which produces concrete of maximum strength is known as a "normal" mixture, and has a slump of about one inch. A reduction in the amount of water of 10 per cent below that required for a normal mixture will change the slump to only one-half inch, and decrease the strength of the concrete about 30 per cent. Increasing the water 10 per cent above normal will inches, and a loss of at least 15 per result in a slump of almost three cent in strength.

A portion of the strength of the concrete must sometimes be sacrificed in order to obtain the placticity of mixture required by the manufacturing processes employed. For payments, floors and large foundations, the slump should not exceed 3 inches. For thin, reinforced concrete walls where smoothness is required but compacting is difficult, a mixture with a slump of 6 or 7 inches is permissable because its wet consistency practically eliminates the necessity of tamping. Remember: Do not make your mixture more plastic than is required by the nature of your work.

POWER FROM STREAM TO RUN GENERATOR

I have a stream of water five inches in diameter, that flows continually year around on my farm from three springs, with a fall of twenty feet (overhead). Is it possible to obtain enough power from it to run a 32 volt generator to store up current in fifteen cell battery? If so, by what mechanical means would be least expensive to construct, overhead wheel or turbin type?—F. X. D., Grand Traverse County, Mich.

—I have calculated that the theoretical power of a 5 inch stream falling 20 feet would be three-quarter of a horse power on the assumption that the rate of flow of water through the pipe is 100 feet per minute. Considering that there would be a considerable loss of power through friction on the water wheel or turbin and some loss of power also on the generator, it is not prob-

VISIONING OUR TASK

A SERMON BY REV. DAVID F. WARNER

INTRODUCING DAVID F. WARNER

THE first appearance of a sermon in the columns of The Business Farmer, is our answer to readers, like C. S. of Oscoda, whose letter was printed on page 16 (392) of the March 17th issue. When we searched for a minister who would fill our needs; a man who believed in his bible, his fellowmen and who lived among and knew the problems of the farmer and his family; a man who, above all, would be a non-sectarian, we found him in the person of Reverend David F. Warner, whose photograph, with Mrs. Warner in the center of page 5, will tell you what kind of folks they are. I hope you will like the Warners, as well as I know they are going to like you!—Editor.

TEXT: Where there is no vision, the people cast off restraint.—Prov. 29:18.

VISION caused Moses to give his life to the freeing of the Israelitish slaves in Egypt. Vision made Lincoln declare if he ever got a chance he would strike slavery in America and strike it hard. And, lo! the "Emancipation Proclamation." Vision led Woodrow Wilson to issue a pronunciamento for universal freedom from the bondage of war. (No, not yet. How depraved our politics and diplomacy!). And vision will move Christian forces out to make men like Christ and the kingdoms of men to become the Kingdom of Christ.

Reader, listen! Isn't the world in appalling need of real brotherhood; of a fellowship of kindness; of a community spirit of love and sympathy? Hasn't the recent war with its aftermath emphasized this need? Hasn't it created for the church a a spiritual crisis? You know that it has. And it has made for us a problem to solve so stupendous in its magnitude as to well tax our faith to its limits. But the Christianity of vision is the Christianity that is prepared to match its faith by its works. To-day we hold the key to the new epoch of tomorrow; and that epoch, if we will, will be a brighter and more glorious one. The church is mistress of that key.

We have faith that the Business Farmer has a clear vision of its task. Our paper's slogan "Hew to the line, let the chips fall where they may," is a good index. The editorials are fitting and ornamenting this rallying cry. And, I take it, these sermons should line up also. To make the printed page warm with the urge and challenge of the higher life, is not easy. This is no sinecure. But the time seems auspicious, and we shall start expecting happy results.

But indulge me a word about preaching. Don't you think sermons and theology are given a disproportionate honor and emphasis? Isn't the pulpit too far from the pew? Aren't they both too far from the unregenerate? I believe, myself, that preaching, polemics, dogma—all are out of all proportion to the time we give to viital religion. As for theology, that is definition. But as for religion, that is life. Jesus placed his emphasis upon life, character, conduct; upon doing righteousness. Since early Christianity men have been fighting over theology, and are as I write. Pathetic, isn't it? But now, let us understand one another at the outset. Let us vision our task to be in agreement with our Master and emphasize religion or conduct. We come to easy agreement here, don't we?

So we are called, not to dissension or destruction, but to harmony and construction. Not to criticism, but to Christian evangelism. What is that? Evangelism is Christianity at work regenerating society. The work is exacting. It means a constant drain upon your strength; a losing of your life. It is not enuf to make a cross upon your heart. You must set up the Cross in your life. It takes a crucified man to promote a crucified Christ. This man is constantly radiating the virtues of the Christ. This is constructive living. This is progress. Any man who is not in sympathy with this onward, upward, society-saving movement is surfeiting and polluting the stream of progress for the aspiring folks about him. "Live fish swim up stream." I felt we should understand one another from the beginning.

But you say, I am a Methodist, a Baptist, or a Presbyterian, and the dogmas of my church are my truth-containers. Yet another said: "I (personally) am the truth." He also said: "Ye are the light (truth)." So we can agree after all that our common task is to translate literal truth into living truth; into personality. This is religeon. This incarnate Truth is to cover the earth as the waters cover the sea. Just this gave us a restless Paul and filled his heart with a pure and ardent passion. It was that pulse-beating of life that gave the world a Justin Martyr, a John Huss, a Wesley, a Luther, a Judson, a Stover, and other bright lights in the spiritual firmament. It is giving us such moderns as Jno. R. Mott and Sherwood Eddy. And it will make you a soul of power and blessing in your community.

But, once more, what is our task? Ask the friendless and the needy; the lonesome and the suffering; and the many that have been stricken by the demons of liquor and war and industrial oppression. Ah, the world is yet a caldron of hate. Her soul is groaning under severest travail. And your church and mine must overcome the racial hatreds and the social misery which have become intensified and embittered by this woeful condition. Thru the extension of Christian ministries we must appease the spirit that is crying out for greed and revenge. We have urgent need to set up the fellowship of reconciliation in the midst of the nations. And doesn't it look as tho our biggest assignment is to spiritualize our own? And we are not going to let pettiness over ecclesiastical differences kill the ennobling spirit which we must bring to this need. Now, we are getting better acquainted with our common task, I am sure.

So, dear friends, sermons alone as a regenerating agency have been weighed in history's balances and found socially wanting. There is but one solution. Jesus injected that solution into a selected twelve and said "Go." Have you made your "mustard-seed" beginning? Then leaven your community. He said it was a leavening, a personal contact process. Think of that when you inoculate your soil for that alfalfa crop. If you believe that Christ is the hope of the world; if you are inoculated with that belief; live it out in your community and you shall witness a consequent luxurious crop in community righteousness.

In the business world the cry is "What can you do?" That measures your worth. In the religious world in that newer, brighter day, it will be, similarily, "What are you doing for others?" That will measure your moral worth. But that must be our measure now. The standard of Christ is "My father worketh hitherto and I work." Heaven's test is "Each man's work shall be made manifest." Would you rest from your labors? Then your works (character worth) must follow you into that earthless, timeless realm.

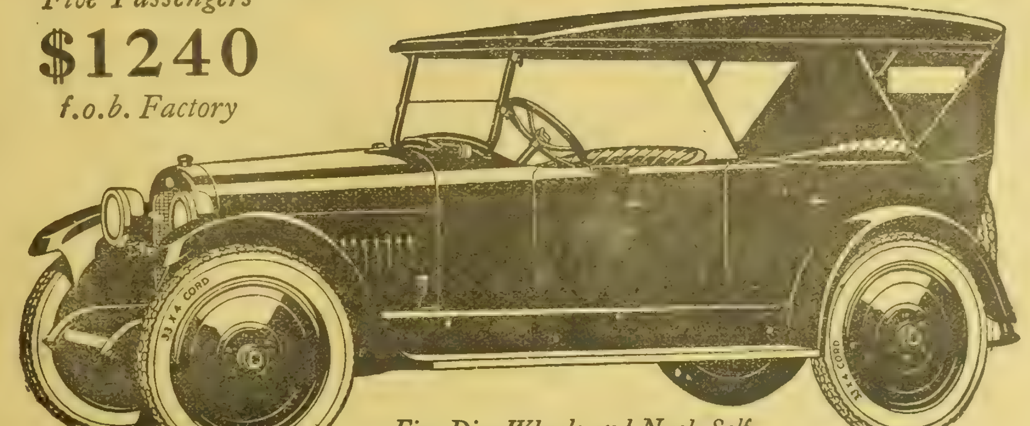
So our task, as we see it together, will be to build and transmit moral worth, character, life. This, we may be sure, is Christianity. Tho, forsooth, in attempting it we can not hope to satisfy every dogmatic demand of a divided "churchianity."

To estimate the number of bushels of grain in a bin, multiply the number of feet of the inside length by the number of feet of the width of the bin, then multiply the product by the number of feet of the average depth of the grain. This gives the cubic feet, multiplied by fourfifths, gives the number of bushels.

Nash Leads the World in Motor Car Value

NASH

New Six Touring
Five Passengers
$1240
f.o.b. Factory



Five Disc Wheels and Nash Self-Mounting Carrier, $25 additional

This new Nash Six Touring model for five people was designed to serve farmers. It's a wonderful performer, with generous passenger capacity, built stoutly and solidly down to the last detail. Two new stalwart cross-members of tubular type reinforce the rigidity of the frame. And Nash engineers have carried the motor and carburetor refinement to a point where the car comes close to the gasoline mileage of a four-cylinder model.

FOURS *and* SIXES

Prices range from $915 to $2190, f. o. b. factory

Potash for Swamp Land

DOES the corn grown on your swamp or muck land look like the large ear or like the small one? The small one shows the kind of corn produced on potash hungry muck land. When 100 to 200 lbs. per acre of German Muriate of Potash, or 400 to 800 lbs. of German Kainit, are broadcasted on potash hungry muck, full yields of sound corn are produced.

For onions, on such lands, 100 to 200 lbs. per acre of German Sulfate of Potash is the right amount to produce full yields of sound onions that ripen normally and keep well.

With potatoes and truck crops, like results are obtained.

Even at war prices potash gave a good profit on swamp lands. Today it is the cheapest plant food. Genuine German Potash will help you reduce the cost of production, and greatly improve the quantity and quality of your crops. There is plenty of it if you will take the trouble to insist on having it.

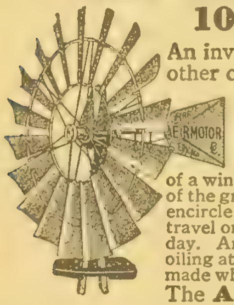
POTASH PAYS



4 TIMES Around the World with ONE OILING
100,000 Miles Without Stopping for Oil

An inventor who could develop an automobile, a railroad car or any other conveyance on wheels which would perform such a feat would be considered a wonder. But such is the record of regular accomplishment by the Auto-oiled Aermotor during the past eight years in pumping water.

Did you ever stop to think how many revolutions the wheel of a windmill makes? If the wheel of an Aermotor should roll along the surface of the ground at the same speed that it makes when pumping water it would encircle the world in 90 days, or would go four times around in a year. It would travel on an average 275 miles per day or about 30 miles per hour for 9 hours each day. An automobile which keeps up that pace day after day needs a thorough oiling at least once a week. Isn't it marvelous, then, that a windmill has been made which will go 50 times as long as the best automobile with one oiling?

The **Auto-oiled Aermotor** after 8 full years of service in every part of the world has proven its ability to run and give the most reliable service with one oiling a year. The double gears, and all moving parts, are entirely enclosed and flooded with oil all the time. It gives more service with less attention than any other piece of machinery on the farm. To get everlasting wind-mill satisfaction buy the Auto-oiled Aermotor, the most efficient windmill that has ever been made.

For full information write AERMOTOR CO. Chicago Kansas City Dallas Minneapolis Des Moines Oakland

MONEY TO LOAN

On the 33-Year Government Amortization Plan to desirable borrowers who own good, well-managed farms in Michigan and Ohio, and wish to borrow not over 50% of the value of their land plus 20% of the appraised value of the buildings.

Copyright by James Oliver Curwood

(Continued from March 31 issue)

"THERE—I've got the lantern!" exclaimed Blackton "There isn't any danger, not a bit. Wait a minute and I'll tell you about it." He lighted the lantern, and the the glow of it Joanne's and Peggy's faces were white and startled. "Why, bless my soul, I didn't mean to frighten you!" he cried. "I was just telling facts. See, we're standing on a solid floor—four feet of packed rock and cement. The dynamite and black powder are under that. We're in a chamber—a cave—an artificial cavern. It's forty feet deep, twenty wide, and about seven high."

He held the lantern even with his shoulders and walked deeper into the cavern as he spoke. The others followed. They passed a keg on which was a half-burned candle. Close to the keg was an empty box. Beyond these things the cavern was empty.

"I thought it was full of powder and dynamite," apologized Peggy.

"You see, it's like this," Blackton began. "We put the powder and dynamite down there, and pack it over solid with rock and cement. It we didn't leave this big air chamber above it there would be only one explosion, and probably two thirds of the explosive would not fire, and would be lost. This chamber corrects that. You heard a dozen explosions last night, and you'll hear a dozen this afternoon, and the biggest explosion is usually the fourth or fifth. A 'coyote' isn't like an ordinary blast or shot. It's a mighty expensive thing, and you see it means a lot of work. Now, if some one were to touch off those explosive at this minute—— What's the matter, Peggy? Are you cold? You're shivering!"

"Ye-e-e-e-s!" chattered Peggy.

Aldous felt Joanne tugging at his hand.

"Let's take Mrs. Blackton out," she whispered. I'm—I'm—afraid she'll take cold!"

In spite of himself Aldous could not restrain his laughter until they had got through the tunnel. Out in the sunlight he looked at Joanne, still holding her hand. She withdrew it, looking at him accusingly.

"Lord bless me!" exclaimed Blackton, who seemed to understand at last. "There's no danger—not a bit!"

"But I'd rather look at it from outside, Paul, dear," said Mrs. Blackton.

"But—Peggy—if it went off now you'd be in just as bad shape out here!"

"I don't think we'd be quite so messy, really I don't, dear," she persisted.

"Lord bless me!" he gasped.

"And they'd be able to find something of us," she added.

"Not a button, Peggy!"

"Then I'm going to move, if you please!" And suiting her action to the word Peggy led the way to the buckboard. There she paused and took one of her husband's big hands fondly in both her own. "It's perfectly wonderful, Paul—I'm proud of you!" she said. But, honestly, dear, I can enjoy it so much better at four o'clock this afternoon."

Smiling, Blackton lifted her into the buckboard.

"That's why I wish Paul had been a preacher or something like that, she confided to Joanne as they drove homeward. "I'm growing old just thinking of him working over that horrid dynamite and powder all the time. Every little while some one is blown to nothing."

"I believe," said Joanne, "that I'd like to do something like that if I were a man. I'd want to be a man, not that preachers aren't men, Peggy dear—but I'd want to do things, like blowing up mountains for instance, or finding buried cities, or"—she whispered, very, very softly under her breath—"writing books, John Aldous!"

Only Aldous heard those last words, and Joanne gave a sharp little cry; and when Peggy asked her what the matter was Joanne did not tell her that John Aldous had almost broken her hand on the opposite side—for Joanne was riding between the two.

"It's lame for life," she said to him half an hour later, when he was bidding her good-bye, preparatory to accompanying Blackton down to the working steel. "And I deserve it for trying to be kind to you. I think some writers of books are—are perfectly intolerable!"

"Won't you take a little walk with me right after dinner?" he was asking for the twentieth time.

"I doubt it very, very much."

"Please, Ladygray!"

"I may possibly think about it."

With that she left him, and she did not look back as she and Peggy Blackton went into the house. But as they drove away they saw two faces at the window that overlooked the townward road, and two hands were waving good-bye. Both could not be Peggy Blackton's hands.

"Joanne and I are going for a walk this afternoon, Blackton," said Aldous, "and I just want to tell you not to worry if we're not back by four o'clock. Don't wait for us. We may be watching the blow-up from the top of some mountain."

Blackton chuckled.

"Don't blame you," he said. "From an observer's point of view, John, it looks to me as though you were going to have something more than hope to live on pretty soon!"

"I—I hope so."

"And when I was going with Peggy I wouldn't have traded a quiet little walk with her—like this your suggesting—for a front seat look at a blow-up of the whole Rocky Mountain system!"

"And you won't forget to tell Mrs. Blackton that we may not return by four o'clock?"

"I will not. And"—Blackton puffed hard at his pipe—"and, John—the Tete Jaune preacher is our nearest neighbor," he finished.

From then until dinner time John Aldous lived in an atmosphere that was not quite real, but a little like a dream. His hopes and his happiness were at their highest. He knew that Joanne would go walking with him that afternoon, and in spite of his most serious efforts to argue to the contrary he could not keep down the feeling that the event would mean a great deal to him. Almost feverishly he interested himself in Paul Blackton's work. When they returned to the bungalow, a little before noon, he went to his room, shaved himself, and in other ways prepared for dinner.

Joanne and the Blacktons were waiting when he came down.

His first look at Joanne assured him. She was dressed in a soft gray walking-suit. Never had the preparation of a dinner seemed so slow to him, and a dozen times he found himself inwardly swearing at Tom, the Chinese cook. It was one o'clock before they sat down at the table and it was two o'clock when they arose. It was a quarter after two when Joanne and he left the bungalow.

"Shall we wander up on the mountain?" he asked. "It would be fine to look down upon the explosion."

"I have noticed that in some things you are very observant," said Joanne, ignoring his question. "In the matter of curls, for instance, you are unapproachable; in others you are—quite blind, John Aldous!"

"What do you mean?" he asked, bewildered.

"I lost my scarf this morning, and you did not notice it. It is quite an unusual scarf. I bought it in Cairo, and I don't want to have it blown up."

"You mean——"

"Yes. I must have dropped it in the cavern. I had it when we entered."

"Then we'll return for it," he volunteered. "We'll still have plenty of time to climb up the mountain before the explosion."

Twenty minutes later they came to the dark mouth of the tunnel. There was no one in sight, and for a moment Aldous searched for matches in his pocket.

"Wait here," he said. I won't be gone two minutes."

He entered, and when he came to

the chamber he struck a match. The lantern was on the empty box. He lighted it, and began looking for the scarf. Suddenly he heard a sound. He turned, and saw Joanne standing in the glow of the lantern.

"Can you find it?" she asked.

"I haven't yet."

They bent over the rock floor, and in a moment Joanne gave a little exclamation of pleasure as she caught up the scarf. In that same moment as they straightened and faced each other, John Aldous felt his heart cease beating, and Joanne's face had gone as white as death. The rock-walled chamber was atremble; they heard a sullen, distant roaring, and as Aldous caught Joanne's hand and sprang toward the tunnel the roar grew into a deafening crash, and a gale of wind rushed into their faces, blowing out the lantern, and leaving them in darkness. The mountain seemed crumbling about them, and above the sound of it rang out a wild, despairing cry from Joanne's lips. For there was no longer the brightness of sunshine at the end of the tunnel, but darkness—utter darkness; and through that tunnel, there came a deluge of dust and rock that flung them back into the blackness of the pit, and separated them.

"John—John Aldous!"

"I am here, Joanne! I will light the lantern!"

His goping hands found the lantern. He relighted it, and Joanne crept to his side, her face as white as the face of the dead. He held the lantern above him, and together they stared at where the tunnel had been. A mass of rock met their eyes. The tunnel was choked. And then, slowly, each turned to the other; and each knew that the other understood—for it was Death that whispered about them now in the restless air of the rockwalled tomb, a terrible death and their lips spoke no words as their eyes met in that fearful and silent understanding.

CHAPTER XIX

JOANNE'S white lips spoke first.

"The tunnel is closed!" she whispered.

Her voice was strange. It was not Joanne's voice. It was unreal, terrible, and her eyes were terrible as they looked steadily into his. Aldous could not answer; something had thickened his throat, and his blood ran cold as he stared into Joanne's dead-white face and saw the understanding in her eyes. For a space he could not move, and then, suddenly as it had fallen upon him, the effect of the shock passed away.

He smiled, and put out a hand to her.

"A slide of rock has fallen over the mouth of the tunnel," he said, forcing himself to speak as if it meant little or nothing. "Hold the lantern, Joanne, while I get busy."

"A slide of rock," she repeated after him dumbly.

She took the lantern, her eyes still looking at him in that stricken way and with his naked hands John Aldous set to work. Five minutes and he knew that it was madness to continue. Hands alone could not clear the tunnel. Yet he worked, tearing into the rock and shale like an animal; rolling back small boulders, straining at larger ones until the tendons of his arms seemed ready to snap and his veins to burst. For a few minutes after that he went mad. His muscles cracked, he panted as he fought with the rock until his hands were torn and bleeding, and over and over again there ran through his head Blackton's last words—Four o'clock this afternoon!—Four o'clock this afternoon!

Then he came to what he knew he would reach very soon, a solid wall! Rock and shale and earth were packed as it by battering rams. For a few moments he fought to control himself before facing Joanne. Over him swept the grim realization that his last fight must be for her. He steadied himself, and wiped the dust and grime from his face with his handkerchief. For the last time he swollowed hard. His soul rose within him almost joyously now in the face of his last great fight, and he turned—John Aldous, the superman. There was no trace of fear in his face as he went to her. He was even smiling in that ghostly glow of the lantern.

"It is hard work, Joanne."

She did not seem to hear what he had said. She was looking at his hands. She held the lantern nearer.

"Your hands are bleeding, John!"

It was the first time she had spoken his name like that, and he was thrilled by the calmness of her voice, the untrembling gentleness of her hand as it touched his hand. From his bruised and bleeding flesh she raised her eyes to him, and they were no longer the dumb, horrified eyes he had gazed into fifteen minutes before. In the wonder of it he stood silent, and the moment was weighed with an appaling silence.

It came to them both in that instant—the tick-tick-tick of the watch in his pocket!

Without taking her eyes from his face she asked:

"What time is it, John?"

"Joanne——"

"I am not afraid," she whispered. "I was afraid this afternoon, but I am not afraid now. What time is it, John?"

"My God—they'll dig us out!" he cried wildly. "Joanne, you don't think they won't dig us out, do you? Why, that's impossible! The slide has covered the wires. They've got to dig us out! There is no danger—none at all. Only it's chilly, and uncomfortable, and I'm afraid you'll take cold!"

"What time is it?" she repeated softly.

For a moment he looked steadily at her, and his heart leaped when he saw that she must believe him, for though her face was as white as an ivory cross she was smiling at him—yes! she was smiling at him in that gray and ghastly death-room of the cavern!

He brought out his watch, and in the lantern glow they looked at it.

"A quarter after three," he said. "By four o'clock they will be at work—Blackton and twenty men. They will have us out in time for supper."

"A quarter after three," repeated Joanne, and the words came steadily from her lips. "That means——"

He waited.

"We have forty-five minutes in which to live!" she said.

Before he could speak she had thrust the lantern into his hand, and seized his other hand in both her own.

"If there are only forty-five minutes let us not lie to one another," she said, and her voice was very close. "I know why you are doing it, John Aldous. It is for me. You have done a great deal for me in these two days in which one 'can be born, and live, and die.' But in these last minutes I do not want you to act what I know cannot be the truth. You know—and I know. The wires are laid to the battery rock. There is no hope. At four o'clock—we both know what will happen. And I—am not afraid."

She heard him choking for speach. In a moment he said:

"There are other lanterns—Joanne. I saw them when I was looking for the scarf. I will light them."

He found two lanterns hanging against the rock wall. He lighted them, and the half-burned candle.

'It is pleasanter," she said.

She stood in the glow of them when he turned to her, tall, straight, and as beautiful as an angel. Her lips were pale; the last drop of blood had ebbed from her face; but there was something glorious in the poise of her head, and in the wistful gentleness of her mouth and the light in her eyes. And then, slowly, as he stood looking with a face torn in its agony for her, she held out her arms.

(Continued April 28th issuue)

THE TRUTH ABOUT HENRY FORD

(Continued from Page 9)

country wait until the evil conditions of today become a menace?

Are Henry Ford's theories and their practical workings during the last five years worth while? Many industries and department stores are putting the interests of their workers above the volume of their profits. They are doing their utmost to benefit their workers, to pay them fair wages and to maintain helpful welfare departments, somewhat similiar to the Ford Educational department. There are still some concerns where women and girls are paid wages that are disgraceful and utterly destructive to the morale of the country. Is it right or even necessary? Or is it better to give labor a square deal and to do it on the basis of honest-to-goodness Americanism?

THE END

How Many Children Have You?

No matter how many you may have, they'll all enjoy this *En-ar-co Auto* Game. It's FREE. There's nothing like it. Nothing so interesting, fascinating, exciting—so full of good, innocent fun.

First the car you enter in the race is ahead—now you may have to go back for En-ar-co Motor oil—again, your opponent may be held up at a railroad crossing while you go speeding on your way—up hill and down, through town and village. You are winning, you think! But wait. You've run out of White Rose Gasoline and must stop for more. And so it goes. Every minute a thrill until the last car is over the finishing line. By all means send for this

FREE—En-ar-co Auto Game

Boys and girls, if your father owns an automobile, truck, tractor, or gas engine and you will have him fill out and sign the coupon below we will send you En-ar-co Auto Game absolutely FREE. You want it and should have it. Grown-ups, you should send for this interesting game for your children: you will enjoy it too. Send in the coupon today. Get the game *Free,* and learn about

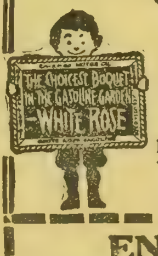
En-ar-co
SCIENTIFIC REFINING
MOTOR OIL

The Oil of a Million Tests

En-ar-co Motor Oil is produced by the most highly scientific process known. That is why its use means scientific lubrication for your motor. En-ar-co Motor Oil guarantees not only uniformity, but the quality to withstand the greatest heat any motor will develop, retaining at all times its friction-preventing, cushioning properties.

The continued use of En-ar-co Motor Oil in your Motor insures less expense for repair bills, longer life for your motor and *more power.*

Ask your dealer for En-ar-co Motor Oil. If he cannot supply you, write direct to us. Do this today. *Use the Coupon below.*



THE CHOICEST BOQUET IN THE GASOLINE GARDEN
WHITE ROSE

En-ar-co Gear Compound for gears, differentials and transmissions. **White Rose Gasoline,** clean, uniform, powerful. **National Light Kerosene,** for tractor fuel, also for lamps, stoves and incubators.

THE NATIONAL REFINING COMPANY
Scientific Refining—In Business 40 Years
Producers of Crude Oil, Refiners and Marketers—Four Modern Refineries—Complete Distributing Branches in 97 Cities, One of Which is Near You.
National Headquarters, National Bld'g, Cleveland, Ohio

EN-AR-CO—Auto Game FREE!
THE NATIONAL REFINING CO., 704-E4 National Building, CLEVELAND, OHIO
Send En-ar-co Auto Game FREE. I have never received an En-ar-co Game. (Write your name and address plainly—preferably printed.)

My name is..........St. or R. F. D. No..........

RELIABLE ADVERTISERS

We will not knowingly accept the advertising of any person or firm who we do not believe to be thoroughly honest and reliable. Should any reader have any cause for complaint against any advertiser in these columns, the publisher would appreciate an immediate letter bringing all facts to light. In every case when writing say: "I saw your advertisement in The Michigan Business Farmer!" It will guarantee honest dealing

"The Farm Paper of Service"

THE STATE INCOME TAX.

IT is hardly conceivable that there is any division of opinion among the farmers of Michigan regarding the Byrum bill now before the Michigan legislature, which provides for an immediately effective tax on the income of citizens of the state.

That it will meet with militant opposition from the representatives of the urban centers which it will directly effect is equally as certain.

It would behoove the city dweller to ponder the present situation casually at least, before arriving at too hasty a conclusion regarding the income tax. If he has given any thought whatever to the subject he must realize that the city or town where he resides is largely engaged in taking the products of the farm and making them into salable products for the worlds markets. The largest market for the sale of his manufactured product, must always be on the farms of this country.

Property taxes in Michigan, as in other states, has advanced during the past few years to a point where they are actually driving thousands of families off the farms. Forcing them to become competitors in the labor markets and consumers of farm products, where before they were producers.

Any individual can certainly afford to pay a direct tax as low as four per cent on his net income, after exemptions have been made for his dependents. There is not a farmer in Michigan who will not gladly pay his share on the basis of the net income derived from his farm and if the farmer is willing to pay such a tax, why is it not equitable for the city man no matter what his work or his earning.

Thousand of citizens live in flats, apartment houses or hotels and owning no real estate or other property pay no direct state tax whatever for the privilege of enjoying the facilities which the state affords for their well being. The state income tax is as sound in principle as the federal income tax and altho faulty, that law is today an accepted fact.

It is claimed that the vote taken in Michigan on the tax amendment to the state constitution voiced the sentiment of the people but we challenge this statement in view of the voluminous correspondence received by this publication immediately following that voting which proved that the farmers, at least, were not sufficiently acquainted with its purpose to vote intelligently on it. We commend to every reader the action suggested in the statement on page three of this issue.

NATIONAL REVIVAL TESTS COUNTRY CHURCH

ALTHO newspaper heads scream with murder, crime and degradation which seem national in their scope, the United States is being swept with a religious revival which is apparent to all who have observed the growth of the church and church activities during the past eighteen months.

Some lay credit for this national revival to prohibition, some to the natural working of the inevitable law which swings from one extreme to the other, some to the depression and slowing-up which followed in the wake of the war and some to the frightful nearness to death, which the war brought to all who were a part of it or had loved ones in it.

In any event the revival is here and the cities which have felt the wave of crime most, now boast of crowded churches at all services The city church too, has taken its rightful place as the center of community life. No longer a place to be sanctified in silence and opened on Sunday only, the modern church is a bee-hive of activity from Monday morning to Sunday night. Young and old are brought under the influence of clean living and the right attitude, (which is after all the whole foundation of Christs teaching) not only thru meditative study of the Bible, but through play and entertainment. Many city churches now boast gymnasiums, swimming pools, dining rooms and always good libraries.

Has the revival come to the country church? Are the pews filling up again with the old-time standbys or the newcomers? If not, it is not because the cycle of time has not brought this condition to within reach again, but because the country church is not living up to its opportunity to become the center of social life in the community where it exists.

With the coming of the automobile the country church suffered immeasurably. Some country churches have turned the automobile to their advantage, however, by extending the radius of their activity the distance which this more comfortable means of conveyance brought within easy range.

If the cross-roads church no longer has its place, it is because the nearby town or city churches have opened their arms to the neighbors without their gates and perhaps this is only in keeping with the trend of times, with is for consolidation. If the country church still has a place, now during this wave of a nation-wide revival is the time to prove it.

TARIFF VS. INCOME TAX

FINANCIAL circles are said to be in high glee over the possibility that the large returns to the government from the present Fordney tariff, will make it possible to reduce the present income tax rate which is six per cent, to three per cent next year.

Let's see now—

The tariff money comes from the people who buy the ordinary things of life, such as sugar, woolens, coffee, tea, etc., in a much larger proportion than from those who buy the luxuries. It is the family, which in the great measure pays the tax, as indirectly collected by the high tariff wall. That ought to be pretty well understood by now!

From this source then comes the extra money which is going to lower the income tax.

Who pays the income tax? Quite generally the men and women who can afford to pay it, many of whom spend less in the United States than does some struggling family of eight on a northern Michigan forty.

We are inclined to believe that this is a step towards unjust taxation, whether you label it "protective" tariff or not, it comes home to the same point; that those who can least afford to pay a high tax for the privilege of bringing up their families in the United States of America would be asked to pay what their prosperous neighbor could pay without feeling it.

The income tax can be made the most equitable means of raising the necessary money for national government operation. It operates most equitably when applied only to net individual incomes. A real saving to all the people could be affected through abolishing altogether the corporation income tax, because it is only passed along to the people in higher prices for the products of these corporations which they buy.

The corporation income works this way. Two persons, one rich the other poor, each own a share of stock in a corporation. A profit is made. The corporation pays a tax on that income. The tax is taken out of the profit due the poor man in exactly the same measure it is taken out of the rich man.

If no corporation income tax were levied, both stockholders would receive the same income from their individual shares of stock, but each would then pay their tax on this income in relation to the amount of their total income from labor and investments. The poor man would pay little or no tax on his dividend from the corporation, the rich man with returns from many investments would pay a high rate, inasmuch as the return from this one share was only a small part of his total income.

EFFECTIVE April 2nd, the subscription price of The Business Farmer was reduced to:

One Year, 60c
Two Years, $1
Five Years, $2

and new or renewal subscriptions will hereafter be accepted at these rates.

There is much evading and many flaws in the present income tax system, as pointed out, but in comparison to a tax, from high tariffs, it is boon to the mass of American citizens.

THE BRANCH THAT THOUGHT IT WAS A TREE

IT had every right to be proud of itself—this grafted branch. In the blooming season, its flowers were large and the creamy petals red on the edges, while the other blossoms on the tree were small and scraggly and dirty-white.

When Autumn changed the flowers to fruit, the apples on this branch were big, deep-red, with hearts as white as snow.

And the branch, seeing this, was swollen with pride.

"Why should I remain a part of this poor tree. I give more fruit than the rest of the branches combined. I will be a tree unto myself that men may know me and give me credit for my fruits."

The next time a strong wind blew, the branch strained and pulled and twisted and finally tore itself from the tree. The tree bled at the wound for a little time, but the gardener came along and grafted another branch in the place.

But the branch that tore itself away died very quickly.

It did not realize that the sap—the life-blood that gave it health and strength to produce—came from the roots of the tree. The branch could not see that because the tree had other branches it was able to drink in more sunshine and rain—that all the branches drew life from the soil and air and gave it gladly that the one branch could flourish and produce much fruit.

So the grafted branch, that thought it could be a tree, died. The tree lived on.

* * * *

The moral of this old fable is that there are a lot of men in every business, or profession, including farming, who consider themselves and their work, so superior to their neighbors in the organization to which they have joined for a common purpose, that they finally break away and end up, whether they know it or not, just where the branch did.

IOWA FARMERS ELEVATORS SUCCEED

FROM 1904 to 1922 there were 532 farmer-owned elevators organized in the state of Iowa and during the same period only 51 ceased business. Where in 1904, nineteen years ago there were only 43 elevators in operation, at the close of 1921 there were 511. These facts are obtained from a very interesting bulletin just issued by the agricultural college of that state entitled "Fifty Years of Farmers' Elevators in Iowa".

We republish these figures here because they prove that farmer-owned elevators can be operated successfully and at a profit. There are always plenty of those who like to say "I told you so!", and usually they make the same remark no matter which way the venture goes.

In the state of Michigan many earnest men have tried to solve the marketing problem, which dominates every other in the profitable operation of agriculture in this country. Many of these men have worked night and day, usually without profit to themselves to try and make the co-operative plan a practical and profitable success. We know of this type of men in our state who have actually killed themselves, worrying over the problems of the cooperative elevator.

And yet, when similar figures for the state of Michigan are produced, we believe a record equal, proportionately, to that of Iowa, the home of the cooperative elevator will be shown. We commend the suggestion of a similar summary for early publication by our own agricultural college. It might be a practical tribute to some of these men who are still alive.

THE FLAT DWELLER'S LAMENT

I live in a flat
where I hang my hat,
And I don't own a farm or a home.

I earn the fat pay
but I'm not the jay,
Who gets tied so I can't ever roam!

Do I give a care, how
much taxes rare?
I pocket my salary
and smile.

But sometimes I get dizzy
for fear they'll get bizzy
An' collect income tax once in a while!

Co-operative marketing and controlled production are economic twins. Neither can be fully efficient alone.

* * *

A ten millon wheat acreage in the four big spring wheat states will beat an act of Congress a mile as a price raiser.

PUBLISHER'S DESK

IT is not hard to sound the depth of human emotion and universal sympathy. Under the heading "A SORRY PLIGHT", in our last issue, I told of the experience of a poor cripple who had been taken-in by an agent who sold him the formula for an automobile polish, charging him $20 for it, which was purely a fraud. Our unfortunate neighbor also asked as to our experience with the so-called "Auto Knitters", and I had to advise him that I had never known of one in successful operation, that is, of one that was being continuously operated to produce hosiery on a profitable basis.

In response to this article, I have received a large number of letters offering suggestions. Two of these letters were from cripples who themselves were operating auto-knitters satisfactorily, but, in each case they were buying their own wool, and selling their products in their own locality. In view of these two statements, it may be that a cripple who can afford to spend the necessary time, can operate one of these machines successfully, where a person in normal health could employ his or her time more profitably at some regular occupation.

I can assure you the publisher was highly gratified to find sympathetic response which the mere publication of these facts brought forth from our readers. With this spirit of helpfulness The Business Farmer can live up to its highest ideals.

THE IMP-O-LUCK

Several readers have asked me whether or not they were responsible for the package sent them C. O. D. $1, by the Imp-O-Luck Company of Spencer, Indiana, and I want to assure them that they are most certainly not responsible for anything which they did not order.

The scheme is not in compliance with Post Office regulations, and we shall bring it to the attention of that department. No company, or individual has a right to send a package which is not ordered, by C. O. D. parcel post, and if you receive a package of this kind from a source which you did not know, do not under any consideration pay the charges. The Imp-O-Luck consists of a cheap Billiken in which can be burned the common incense, which can be purchased in any Five and Ten Cent Store. In their advertising this company claims that to breath this incense will bring "success." They also sell "Love Cones," which burned in a similar way will, 'tis said set the heart of an old maid or old bachelor aflame with new hopes and desires.

* * *

Will some good reader who lives near Paw Paw, Michigan, tell me who W. J. Barnard is, what he does, and how he earns his living. A reader sends me a newspaper clipping referring to statements which he is said to have made before the Allegan County Milk Producers Associaition, in which he attacked President Friday, county farm agents and farm paper publishers. Generally, I would like to know about this gentleman. Perhaps he is the Moses who has come to lead the agricultural business out of the desert! If so, we wonder what he charges for piloting.

* * *

I have been asked about the Railway Educational Association, 227 Monroe Street, Brooklyn, New York, who promised to teach the art of becoming a locomotive fireman, with the assurance that their students will earn from $200 to $250 a month, and I want to repeat that there is no other way to test out the merits of a Correspondence School than to ask them for the name of a student in your locality who you can see and talk to, or at least write for their advice.

Most correspondence school schemes depend on the students who start the work and never finish. A student who goes all the way through the course and passes their examination is usually the exception, and costs them more to teach, than they charge for the course. They have to depend on the fellow who drops out, after one or two lessons, and whom they usually force to pay the entire amount he originally contracted. My advice again is, don't sign up until you know you are going to complete the course.

* * *

THE GREEN EGG COMPANY

Has any reader had experience with the Green Egg Company, of St. Louis, Mo., who we understand are soliciting shipments of eggs in Michigan, and regarding whom we cannot secure reports which would lead us to encourage shipments to them. If any of our readers had experience with this company, we would like to hear from them.

* * *

HEIR TO MILLIONS

Some of my readers are in high glee! They have been notified by lawyers somewhere that they are far distant relatives of Anneka Jan Bougardus, and therefore are the lawful claimants to part of 168 acres in the very heart of the city of New York, where giant skyscrapers tower heavenward from tiny patches of ground which are therefore worth millions.

Think how you would feel if you were heir to the very heart of the richest city in the world! Would there be any reason why you should not contribute to these lawyers to fight your claim for this property.

Well to make a long story short, we would say that there were several good reasons why we wouldn't offer any heir to this, or any similar estate more than five cents on the million of the legacy that he or she expects to get, and then it would be on gambling spirit, and not our better judgment that was making the speculation.

* * *

FAT REDUCERS

Lately we have had several letters from corpulent ladies who are regretting the fact that although they have sent their $5, $10 or $20 for treatment, which ranged all the way from phonograph records to powder they put in their coffee or tea, they have not been able to reduce in weight so they resemble the Venus like figure shown in circulars!

It is hard to keep a straight face and read some of these letters, because if it is true that "everybody loves a fat man," it must be equally true that the average corpulent lady is usually endowed with two of God's rarest talents, which He can give to womankind: The habit of laughing at trouble and the ability to turn ordinary food stuffs into delectable dishes which hold their men folks. You seldom see a fat ladv who is not a good cook. If these fat reducing schemes are going to lesson their cooking ability, God save us!

Seriously it is not necessary for any person to be overly fat. Proper food and proper exercise will bring sure reduction. There is a splendid book on this subject called "Eat and Grow Thin." If any of you fat men and women are interested apply at your nearest library for it.

CLAIM SETTLED IN TEN DAYS

In regard to the claim which you took up for me will say they made a satisfactory adjustment within ten days. The number of claim was 1181. Many thanks to you for the help and you may rest assured I will always be a booster for your paper which I would not be without. —R. J. R., So. Lyon, Mich.

Book Review

(Books reviewed under this heading may be secured through The Michigan Business Farmer, and will be promptly shipped by parcel post on receipt of publisher's price stated.)

THE 50-50 FARM, by Dr. C. L. Wendt—The author has in this 105 page volume covered in full the Wendt Farming agreement, which has been discussed in The Business Farmer and other farm papers during the past year. It is an exposition of the earnest attempt of a student of farm tenantry in America to arrive at an equitable contract which gives both landlord and tenant a square deal. Whether you are in one class or the other this book ought to save you many times its original cost and your effort in studying it. (Manilla Covers, $1.)

First Mortgage Real Estate Gold Bonds

The general attitude of mind of the American public seems to be to concede Federal first mortgage bonds a place and position all their own as a sound, safe investment.

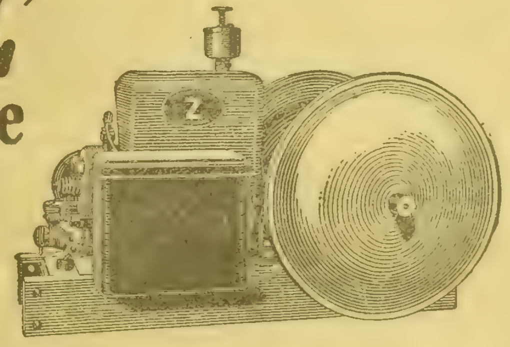
F. O. B. FACTORY
1½ H. P.
Battery Equipt



Make more money on your farm

"Time *is* money" on the farm today. Every farmer knows that he must make every minute count to get the most production and profit out of his place. You can save time—and "time saved is money made"—with a Fairbanks-Morse "Z" Engine.

This famous helper is now at work on more than 350,000 farms. At present remarkably low prices the 1½ H.P. Battery Equipt Model is the cheapest farm help any man can have. It does more work for less money than any other machine or man you can employ. It has been in such great demand all over the country that for many months the factory was unable to build enough of them.

Uses gasoline alone. Has high tension battery ignition, hit-and-miss governor and balanced safety flywheels. Control lever gives six speed changes. Carburetor requires no adjusting. A remarkable value.

The magneto equipt 1½ H. P., 3 H. P., and 6 H. P. are *real* kerosene engines, but operate equally well on gasoline. Have simple high tension oscillating magneto. Throttling governor assures steady speed. Prices, F. O. B. Factory. Add freight to your town.

1½ H. P. $71 3 H. P. $105 6 H. P. $168

Other "Z" Engines up to 20 H. P.

Write for complete details. See the engines at your dealer's.

KEEP THE BUSINESS FARMER COMING
SEE PAGE 25

What the Neighbors Say

TOO MUCH CREDIT

I AM writing these lines in hopes some of the readers will see what credit, credit and more credit can and does do for the majority of small farmers. I know all this from experience, but, thank goodness, I have profited by a most expensive lesson. Credit was the name and about $1,500 the cost.

When I first came to this state to start farming I had no money to buy for cash, so I, like most all farmers are doing today, started going to sales. My banker said my credit was good. It was, too. I bought what I needed to farm with. Then he told me "Here's a good buy" and "There's a good buy." Oh, yes, he was very accomodating then (and is to everybody now till he get them to buying).

The first year I paid all my notes. That fall I bought more cows. The second year crops were not extra good so I paid every cent I had and still had to renew some. High interest had to come in advance so I had to make a note, due in the spring, for interest. In the winter I had sickness and was not able to pay the interest. I got word that the sheriff would be my next visitor. I went to a lawyer. He said the bank could not forclose on an advance interest note which was an unlawful note to start with. This proved so. Then by selling all the young stock I had I paid off the interest and some on the principal. But the banker tore up the note instead of stamping it paid and giving it to me. Then the third year my crop drowned out. I could pay nothing. I was told to have an auction sale, which I would have been forced to do if I had not had a friend of true blue. He helped me out, and seen to it that my notes were made out at 7 percent interest and no interest in advance and I will always keep them that way. For if I can't do business with one that will do it lawfully, I will go without. Since I have started on this system I am getting ahead instead of sinking with excessive interest as a dead weight.

I am not the only one that was so foolish, for literally speaking the majority of this country belongs to the bank as I once did.

Why is it the law makers are forever thinking up some law to punish the small offender, and never make a law that would take care of bolder and much greater offenders. Many of the small country bankers can put on a white collar and tie, get behind their cage and rob every one that comes that way—they call it a bonus. If the people won't be robbed peacefully, they are told to have an auction sale. Oh, yes, then they are a big man. It certainly would be the work of providence if all the small banks could be—well, just put out of business. I hope many of the readers will see what credit will do, and will profit by another's experience.—P. B., Gladwin County, Mich.

MORE ABOUT TAXES

I NOTICE in the February "Review of Reviews" Dr. Friday's computations show that "the farmers were paying 26 percent of all the taxes in the year 1913-14 and 18 per cent in 1921-22. Putting it somewhat different the farmer shouldered $774,000,000 out of a total of $5,362,000,000. He had been paying one fourth of all the taxes before the war, but he assumed only one seventh of the additional burden which has been laid upon the public." He also computes that the farmers only assumed slightly over one ninth of the increase of the direct taxes. This information should be a great comfort to the farmers, no doubt they will now be able to meet this small proportion of the taxes with no inconvenience.

Wonder if the Doctor will find that the dairymen are not carrying their just burden in supplying milk for the City of Detroit.

In discussion of taxes, Dr. Friday might have brought out the fact that property assessment is computed generally from the income of the property. But this rule does not apply to farm property. I do not think that farmers would ask that this rule be strictly adhered to, as they would have paid no taxes the past two years on that basis. But the rule should not be ignored.—Howard Smith, Saginaw County.

BAD CASE OF "CARNIVALITIS"

AT one of our Northern Michigan fairs we have developed one of the worst cases of "carnivalitis" that you ever saw for a fair its size. From every known form of gambling, dancing girls, gypsy fortune tellers, and all are there in fine form(???)

I never could see the advantage of inviting other horses in to run away with fat purses when the local interest is twice as great in local horses at one fourth of the money needed to induce outside horses to race.

After a recent fair I overheard a conversation between two little boys. They were joshing each other about seeing one of the tent attractions reserved for men, and from what I gathered neither was very proud of having seen that particular "show."

I hear some one person say, "O pshaw, they must bump into such things sooner or later." But I think most mothers would rather it would be later.

To me it seems to be the most unfair thing to have a fair like this when we have such wonderful agricultural resources with which we could have such a good fair. Personally, I know of a number of farmers that will have nothing to do with a fair of this kind that would enter heart and soul in the right kind of a fair.

What is more stimulating than a friendly rivalry as to who can raise and exhibit the best potatoes, corn or fruit and what is more interesting and instructive than a good livestock exhibit, besides see the opportunities for advertising one's particular specialty.

I am sure from the comments heard on all sides that the farmers prefer an agricultural fair to a carnival every time. Let the State Fair have their carnivals if they want to but I hope to see the day when our own particular fair will have all such objectionable features eliminated.—Mrs. E. J. C., Alpena County, Michigan.

THE FARMER AND HIS TROUBLES

THE farmer is receiving his full share of adverse critism and free advice as usual. I read an article in a farm paper recently which implied that the farmer is better off than he thinks he is. It enumerated a long list of things which a farmer with intelligence and gumption," should do when times are hard and work slack (as if work on a farm ever was slack) such as grubbing stumps, cutting fence posts, breeding better cattle, culling poultry, repairing buildings, raking the yard, making flower beds and being more civil.

It also said that with proper management the farmer can always have fine potatoes, choicest beef and pork (fresh), fried chicken or chicken-pie when his fancy dictates. Eggs without number, cream and the finest of fruit and vegetables. No mention was made of the work necessary to produce all these or their worth in the market.

I quite agree that it requires gumption and intelligence to manage a farm properly and profitably. One can't be on the job today and off tomorrow. I also maintain that the majority of farmers possess the necessary qualifications.

Also there is no business in which man invests so much, runs so great a risk on his investment, works so hard to make it pay and where the outcome is so uncertain. He may prepare the ground for seed, plant, or sow the best, cultivate and hoe, but if weather conditions are unfavorable, he loses.

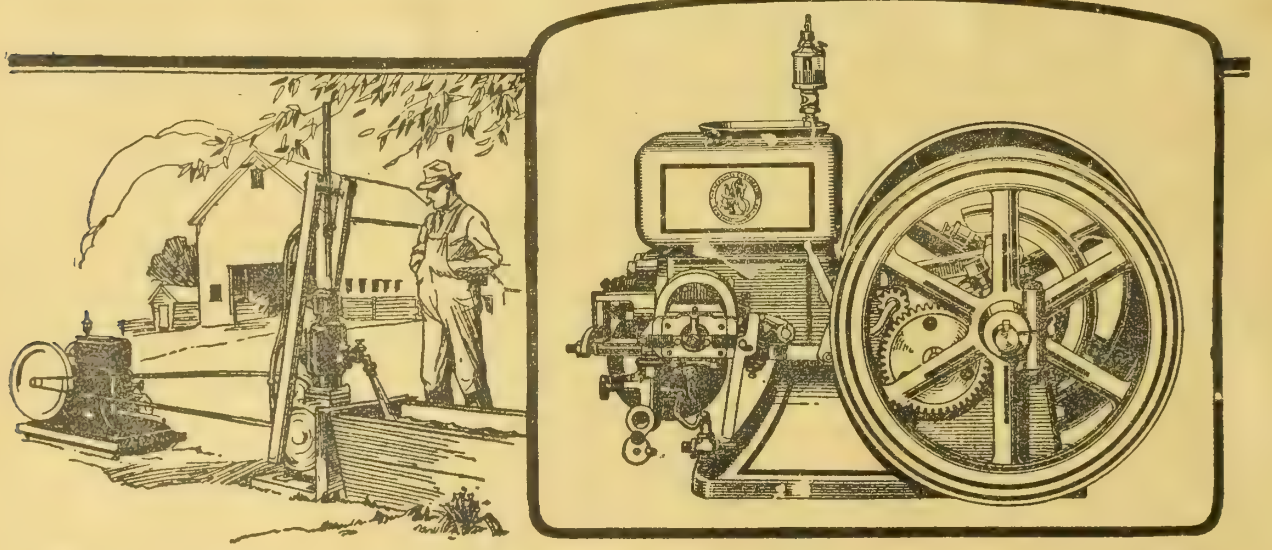
The crop may grow and flourish and a wet harvest ruin or hamper. Also there is the fly for the wheat, smut for all grains, bugs and blight for potatoes, anthroenose for beans, and WEEDS for all.

The garden where all those wonderful fruits and vegetables are produced does not, like Jonah's gourd, spring up in a night, but is the result of constant and patient labor with the hoe and rake, in the cool hours of morning and late evening, by each member of the family in turn. And many more hours before those same delicious things stand in shinning jarrs on the shelf.

The city woman can go to the early morning markets and buy in quantity from trucks at a reasonable price and fill the same kind of jars with equally delicious fruits and vegetables if she possesses the same brand of gumption and intelligence as the farmer's wife.

As for meats, she also has the privilege of going to the market, buying in quantity, curing and canning as cheaply as the farmer's wife. We often do this rather than dress at home as it costs no more, after counting pounds an animal dresses away and cost of dressing.

As for fried chicken and chicken pies, we never grew them that way.



"It has already paid for itself"

"A YEAR ago," writes Benjamin Gerlack, of Kingston, New York, "I purchased a 5 H. P. Hercules Gasoline Engine, thinking that it would help the hired man and me about the barn and farm.

"It has done more than that. It has saved me the wages of one man, besides making the work easier for all of us. *It has already paid for itself.* . . . I call it my partner."

The Hercules is a partner that does more than its share of the work without asking a share in the profits. And its work is the hard work, the backbreaking, uninteresting work. It saws the wood, pumps the water, runs the dairy, the washing machine, the feed grinder, the machine shop—the jobs that no one else wants to do. And it does them faithfully the year 'round.

On your farm there is work for the Hercules. There is a Hercules designed to do that work so efficiently, so much better and more quickly and at such a saving that, like Mr. Gerlack, in a short time you can say, "It has paid for itself."

Hercules Engines range in size from 1½ H.P. to 12 H.P.—both gasoline and kerosene types. They are equipped with the latest type of magneto—one that keeps the engine at work out-of-doors in any conditions of weather.

There should be a Hercules dealer near you. If there is not, write us and let us advise you about the ideal power for *your* farm—the size and type of engine that will best suit your requirements.

THE HERCULES CORPORATION
Engine Division Evansville, Ind.

HERCULES ENGINES

It takes our eggs 3 weeks to hatch out fluffy balls that must be kept warm and well fed for many weeks before they are large enough to dress and fry. We usually use one dozen to 15 from August 15 to Nov. 30. Then cull out old hens and undesirable pullets and sell them. Also all except a few choice roosters to sell for breeding. This leaves a flock of the desired number and my fancy never dictates killing a laying hen.

The endless number of tasks Mr. B. would have us do when times are hard, have always been part of our yearly routine. The lawn, back and front is always raked in spring and mowed as long as grass grows. There are flowers in the flower-graden from spring's first kisses until snow flies.

Stumps are unknown, the wood lot is quite diminished and coal a necessity.

The farmer must work and fight against odds continually. He has crop failures, loss of stock, low prices, sickness, taxes and interest and "hard times" is often the knock-out blow. He earns every cent he gets but he does not get every cents he earns by any means.

It requires the same gumption and intelligence to live and learn in any walk of life, and the farmer is no better off than he thinks he is. He knows his needs and his limitations.

The foolish farmer, so they say,
Grumbles louder ev'ry day;
Tho' sixteen hours of daily toil
No man's temper ought to spoil.
'Tis only "gumption" that he needs,
To create a zest for feeds
Of richest viands with dearth
With no thot of what they're worth.

The envied farmer is, they say,
Growing richer day by day.
This hard time talk is just a bluff.
He is farming well enough.
Six hours of chores are only fun
Quite forgotten soon as done.
"Tis finer sport to pitch manure,
Aching back to thus insure.

The fabled farmer must, they say,
Show his mettle all the way—
Plowing, rolling, discing, dragging,
Countless miles, never lagging;
Sowing, planting, using hoe,
For the weeds begin to grow;
Not for a moment dare he rest
Since with 'tater bugs he's blest.

Lucky farmer, if he but knew,
Is much better off than you,
When times are hard and spirits low,
Still his "gumption" make him go.
Stumps to grub and yard to rake,
Flower beds for wifie's sake,
Cows to breed and his poultry cull,
Times for him can not be dull.

Greedy farmer, your sumptious fare
Comes like manna from the air;
Choicest beef and juciest pork,
Chickens fried and with no work,
Scores of eggs, oodles of cream—
Sounds like a fanciful dream.
Tax forgotten, int'rest unpaid,
Annual payment no yet made—
Hurrah for the farmer! Lucky guy!
Who cares a fig? Not I.
—Bessie O. Roberts, Saginaw Co.

CHANGING TIMES

By JOHN T. BARTLETT

A GEAT FUTURE FOR HONEY

EVEN most young folks, and certainly very readily older ones, can recall the day when honey meant just one product—comb honey. The general introduction of strained or extracted honey, only a comparatively few years ago, was an event the economic importance of which was little guessed at the time. It gave seven league boots to the beekeeping industry. Before comb had been a commodity not easily shipped and handled. Now, honey could be put in glass jars and pails. It was readily shipped, readily displayed by the dealer, readily kept in the home. An enormous increase in production and consumption followed.

The advance of honey has just begun. Low prices contended with the past two years are "growing pains," met with in the expansion of any industry.

Here are straws which prove a great future.

The public is being educated to larger purchases. Hundreds of retailers the present year have picked honey to use for price specials, selling at nearly cost. Most of them have priced 10 pound pails, many 60 pound pails, as well as smaller sizes. Many families have been educated to buy the larger sizes, most economically and certain to encourage greater use.

There are new honey products of great possibilities. A live Pacific Northwest beekeeper packages and distributes granulated honey. This makes a great spread for bread, and, besides secures an economy in container cost. "Honey-nut" butter, under this name or others, is being regularly retailed in various places. It is a simple combination of honey and peanut butter. It makes a splendid filling for candies. Its much wider use is as a spread supplanting peanut butter. When one realizes how enormous is the peanut butter traffic, it is easy to glimpse the expanded market for honey being sold on an increasing scale. Watch honey consumption increase.

NEW IDEAS IN CONTAINERS

MAKING a container which the producer can pack, and which as packed can go through to the consumer unbroken, half bushel baskets are in limited use in a considerable number of shipping districts. Their use will probably grow.

A Michigan fruitgrower has invented a bushel basket with a detachable bottom. It is packed upside down. The top, that is, is put cn, the basket inverted, the bottom removed, and the basket packed. Then the bottom is put on. Time is saved in packing, less skill is required, and when the retailer removes the top for display, the top apples are uninjured.

Onions and other products now go to market from the South and some other sections in fibre boxes. A nifty package! The shipper put his advertisement on the box.

Things are happening fast these days in the field of fruit and vegetable containers. The use of bushel baskets for apples and other fruits and vegetables has had astonishing growth. It is now the commonest package in some districts which, four years ago, had hardly seen a basket used for apple shipment.

Several points have established the basket in use. First, it is economical. Nested, it is readily shipped from factory to country shipper, and readily stored prior to use.. .Numerous efficient ways of tiering baskets in cars have been originated. Retailers like baskets for display purposes; something about the rounded effect is very appealing to customers. With its handles, the basket is very conveniently handled—all along the route from producer to consumer. Improved methods of manufacture have made the modern basket light, yet strong.

Finally, the bushel basket is of a size adapted to modern conditions. Retailers like to buy in bushel units; the unit suits consumers.

More than any other thing one condition gave the bushel basket its initial foothold in many localities—its low cost. When apple barrels reached over $1.50 in the East, combined with the low market prices for apples, there was a landslide to the basket. In boxed territory, the basket is much used for the lower grades.

MIDWAY UNNECESSARY

IN answer to your recent query: "Is the Midway Necessary to Support Our Fairs?" I am expressing my views. To my mind the midway is both vulgar and unnecessary. It awakens the gambling spirit and caters to the morbid and curious. I have seen with disgust the hardboiled proprietors of games of chance rake in the children's hard-earned coins with brawling and unconcerned manner.

A fair should be free from vulgar and grotesque carnival features, and instead, foster a keen and honest spirit of worthy competition in all lines. It should encourage the young generation to higher ideals, not lower. It is not desirable to deprive the youngsters of all wholesome amusements at a fair, so by all means let us retain a clean and first class free grandstand show, and the ferris wheel, whip and frolic, they all have their places. A good movie, musical treats or even a public dance pavilion, conducted by proper officials would be a vast improvement instead of the now prevailing and undesirable Midway.—J. J. G., Akron, Mich.

McCormick-Deering 15-30 Tractor Offers You Power Based on Five Construction Principles

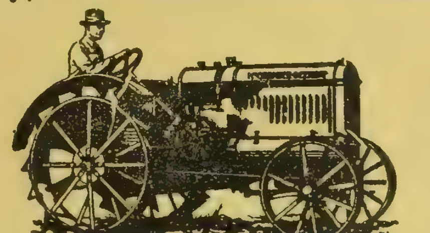
1. *Sturdy Unit Main Frame—*
Extends the entire length of the tractor; its shape and design make it an unfailing foundation for the working parts. No twisting nor yielding. Permits the entire tractor to be built with greater precision, which reduces wear and vibration.

2. *Ball and Roller Bearings at 28 Points—*
The power of the sturdy McCormick-Deering engine is carried without unnecessary loss through smooth-running ball and roller bearings to the drive wheels or belt pulley—steady, dependable power, at your command through long years of service.

3. *Unit Construction—Easily Accessible—*
Every important part [engine, transmission, steering assembly, etc.] of the McCormick-Deering 15-30 is built and tested as a separate unit, then bolted securely into place in the rigid main frame. Easily removed and repaired in the field or shop. No unnecessary delay and expense.

4. *Ball-Bearing Engine—*
The crankshaft has two heavy-duty ball bearings. This design minimizes friction and shaft breakage—a feature years ahead of general practice. All wearing parts are replaceable, including the cylinder walls. There should be no limit to the life of this engine.

5. *Operator Comfort, Convenience and Safety—*
Assured by the roomy platform, wide fenders, adjustable seat and foot levers, minimum vibration, well-balanced weight, adjustable drawbar, throttle governor and Alemite lubricating system. All gears and important bearings are enclosed and run in an oil bath. No moving parts exposed.



Every farm power user should *know* this modern farm tractor. If you will go to the store of the nearby McCormick-Deering Dealer he will point out the many exclusive features that place the McCormick-Deering 15-30 ahead of the field.

The Children's Hour

DEAR Nieces and Nephews:—Last week a letter came to me from one of my nephews (I will not tell his name) that contained the following:

"I would like to get a squirrel for a pet. Would you please give me some instructions on making a trap that would catch them and not harm them? They are such frisky little fellows that I would like to catch one."

He must be a new member of the Children's Hour because if he has been a reader of our department for some time he should know what I think of capturing the animals that roam the woods and fields to make pets of them.

I will not tell him how to make a trap. God did not put the squirrel on earth to be caged up as a pet for man. What would you think if some great giants captured us and placed us in cages and made us stay there the rest of our lives? We would not like it, would we? Of course not, and neither would the squirrel.

If you wish to make a pet of a squirrel it is not necessary to catch it and put it in a cage. If you have ever been to Detroit and visited Belle Isle you no doubt have noticed how friendly the squirrels are on the island. Some of them will even eat from your hand if you are very quiet. Squirrels in the country will be just as tame if you are careful. Spread food where they can find it, keep some distance off while they eat for several days, then each day come a little nearer and before you know it you will be able to stand within a short distance of them and they will not be afraid. Within a few weeks they will expect you to feed them and watch for your coming. With kindness and patience you will be able to win their friendship.

Our contest is coming along nicely as shown by a few samples on this page of the letters I have received so far. Most of the letters are very well written and show careful thought and I am sure we are going to have considerable trouble in deciding the winner.—UNCLE NED.

OUR GIRLS AND BOYS

Dear Uncle Ned.—I was reading about which was the most interesting part of the Business Farmer and so I thought I would tell you what I thought the people like best.

I think the Farm Home department is what interests our mothers because it tells all about how to get stains, contains recipes, and the poems are beautiful. I think that for the men the story about Henry Ford and the front part of this paper is good. I know my father is interested in it and I have heard many other men speak about it. My mother likes the Farm Home department and I have heard many other women speak about it. I expect you know what part I am interested in. The Children's Hour. I was sick about three weeks ago and my mother read them to me. There was quite a few in the paper that time, there was about two pages of them. I like the poems you print. I speak pieces quite a lot. I like the piece you wrote in the paper this time or the poem that was put in the Farm Home department last issue or the Easter hymn.

I must describe and tell you about myself now. I have blue eyes, medium brown hair, am thirteen years old and in the eighth grade. We live four miles from Charlotte, two miles from Potterville. I would like to have the children write to me. I will answer their letters as soon as I receive them. I will close with a riddle, when is a nose not a nose? The one's that guess this riddle I will write a letter to, I will have to close for this time, your niece, Miss Isadora Perry, R. 8, Charlotte, Michigan.

Dear Uncle Ned:—May I join your merry circle? I have written before but did not see it in print. I am a boy 12 years and in the sixth grade. My birthday is the 4th of June. I wish any boys whose birthday is on that date, would write to me.

The best department of the M. B. F. is the "Poultry for Profit." I like it because it's about poultry and I like to take care of chickens, especially when they are small. They are so cute, it is fun to see them quarreling over a worm or see them step on one anothers feet and get in a fight. I like to make pets of them so they will come up to the doorway where I feed them. I hope I will win a prize.

Well I will close with a riddle. Round as the moon, black as a coal; and has a tail on it. Answer: A frying pan. Well I think I have written enough so good-bye to Uncle Ned and the boys and girls. Harold Snyder, 2130 Luella St., [illegible]

Dear Uncle Ned:—This is the first letter I have ever written to you. But have thought of writing lots of times. I do not live on a farm just now. We sold our farm last fall and took a trip to southern Georgia. I liked it quite well there but I like Michigan best.

I am 13 years old. I have no pets now, but when I lived on the farm I had about 60 rabbits and a big shepherd dog.

What I think is best in your paper is the Children's Hour. My mother likes the stories and the Farm Home department. My father likes it all. He says he never saw a paper with so much of interest to the farmer and it is so much help to him. I like also to read the M. B. F. better than any paper but I think the Children's Hour is of most interest to the boys and girls. Also the picture page. Your loving niece.—Sussie Tonpkins, R. 5, Reed City, Mich.

Dear Uncle Ned:—I was reading in your letter last night that you are going to have a contest. May I tell you which part I choose? I choose the Children's Hour because I understand it better and I choose it because there are more children in it.

I am a Girl Scout of Huron City. There are forty-six scouts. I have four sisters and two brothers and two nephews. I live on a farm of 160 acres. We have six cows, four horses, ten young cattle, five small calves and five pigs. We have a pet goose. Its name is Peggy. I am eleven years of age and in the fifth grade. My birthday is on the 14th of January. I will close with some riddles. When is a sheep and ink alike?—Answer: When it is in a pen. Spell black water with three letters.—Answer: I-n-k. What is all patches and no stitches?—Answer: Cabbage. Why don't they collect fare from o policeman on a street car?—Answer: Because you can't take a nickle from a copper. What is the difference between a pen and a pencil?—Answer: One is drove and the other has to be lead. Always a liquid but sometimes gets hard? Answer: Cider. Your niece, Katherine Berry, Grindstone City, Michigan.

Dear Uncle Ned: May I join your merry circle? I am a girl 15 years old and I thought I would try the prize winning contest for our Boys and Girls, that you mentioned in the March 31st issue of the M. B. F. The department that I think is the best in the March 31st issue is as follows:

Poultry for Profit

The reason why I think this is the best department is because most all people raise puoltry. The city people, as well as the country people most always raise poultry. In the M. B. F. of the March 31st issue, is mentioned the facts that all people need to know in order to get the best results in poultry raising. I will now mention a few of the facts below. First of all comes careful feeding. You must feed the baby chicks just a little at a time, and feed them three or four hours apart so as they will have enough saliva to moisten the food and then be able to digest it properly. Second, is the moisture that is needed to satisfy the little chicks thirst. At first, until they are about three days old there is moisture enough in their food for them, but after that you will have to set a dish of water in their pen for them, as they will need quite a lot of water as they grow older. Third, is the chickens shelter or coops. Their coops should be set facing the east so they will get the first rays of sun in the morning. This is necessry because chickens are always up as soon as it is day light, and as it is generally cool then they need all the warmth they can get. They should have plenty of room in their coops and as they they should have roosts to set on when they go to bed for the night. With the facts mentioned I think people can take care of their chickens so as to get the best results in the meat and eggs. Well good-bye Uncle Ned.—Isabell Manary, Auburn, Michigan, Route 1.

Hello Everybody:—As I have never won a prize yet, I thought I would try and win this one. I think that "The Truth About Henry Ford" is the most interesting article in the Business Farmer because the older people enjoy reading the life of this rich man. I heard that he had three million dollars in the bank and had forgotten all about it so he must be pretty rich, don't you think so, Uncle Ned? I do. The older people enjoy reading this story because it tells all about the life of Henry Ford and some of his adventures and what inventions he has made.

Well Uncle Ned, do you think you could answer some riddles if I asked you some? I will ask some and give the answers too. What is the best material for airplanes? Answer: Fly-paper. What ship carries the most passengers? Answer: Courtship. Round as an apple, deep as a cup all of kings horses can't pull it up. Answer: Well. Round as an apple, flat as a chip, has two eyes and can't see a bit? Answer: Button. Round as an apple, busy as a bee, the prettiest little thing that you ever did see. Answer: Watch. Now the one that answers this one, I will write a letter to telling about what I seen in Detroit the last time I was down. Little Nancy Edicoat, standing in a petticoat, the longer she stands the smaller she grows. How many of the cousins got over 20 valentines? I'll say I did. I got 23. What do you think about that? It has not thawed here yet. I mean we still have a little snow. It thawed about two weeks ago but it snowed after that. I heard that they have five feet of snow in Alpena county. I was 12 years old on the 24th of March. Is there anyone whose birthday is on the same day as mine? If there is I wish they would write to me and I would answer all letters received, and from any other cousins too. I am in the sixth grade. Well Uncle Ned, I would like to win the prize but don't know whether I will or not, and my letter is getting pretty long and if I do not quit pretty soon Uncle Ned will be getting a switch off the old willow tree and getting after me for writing so long a letter so I will say good-bye Uncle Ned and Cousins.—Hazel Baker, in care of J. Baker, Elkton, Michigan.

Dear Uncle Ned:—First, I think that the farm crops, and veterinary departments are the most interesting parts of the M. B. F. because they give opinions of other people, facts that have been proved, and last but not least the cures for the farm animals. It tells how to improve your crops, and which crops to grow in rotation. Second, I think that the Farm Home department is next best, for it gives good recipes for cooking and baking. It tells how to keep the house clean and how to take dirty and greasy spots off. It has patterns that are all up-to-date. Third, I think that the children's department is next in line. It brings the lonely and sad, the happy and gay children closer together, and the contests you have help them also, because some of them may be inclined toward writing and this helps very much in penmanship. Next comes the story, Collection Box, "What the Neighbors Say" and other numerous departments of the paper.—Mary James, Sheridan, Michigan.

Dear Uncle Ned:—I have been a silent reader for sometime. May I join your merry circle? When we get the paper the first thing I look for is the Children's Hour. I am in the seventh grade at school, and am 13 years old. I have to walk one mile and a half to school. We have stone roads all the way so you see it is not hard walking. Good-bye, from Neola Townsend, R. 2, Freeland, Michigan.

SAVING MOTHER THOSE EXTRA STEPS

(Continued from Page 4)

" 'Roll rim sinks with a back attached are usually provided with nickel plated traps, either extending to the floor or to the wall. Extending to the floor is usually better for sinks attached to outside walls. Traps to the wall leave the floor beneath the sink free from piping.

" 'Nickel plated traps may be attached to either lead or iron pipe if the proper fittings are provided. When attached to an iron pipe a slip joint is used. The nickel plated pipe is inserted into the iron pipe; then the slip nut is screwed down onto a rubber gasket. A nickel plated pipe may be attached to a lead pipe by soldering, or by a union and a short piece of iron pipe. The lead pipe is inserted in the lower half of the union and beaded over, the nickel plated pipe is then inserted in the iron pipe and the slip nut screwed down.

" 'In some installations it is impossible to have the sink on an outside wall or near an outside wall. In such cases it will be necessary to have a low waste pipe.' "

"Just a minute, Dan," interrupted his father. "How about bad odors that might come back through the sink owing to the accumulation of waste matter in the longer waste pipe."

"To overcome that it is necessary to insert a trap in the pipe just below the floor, where you make the bend," explained Dan. "There is a picture in the book that shows just how it is done."

" 'Traps are usually placed directly beneath the fixture, but since in a great many cases sinks are installed in houses not heated by a furnace, the trap will be less likely to freeze if placed just below the floor line. as shown.

" 'In cases where a long waste pipe is necessary, it will be best to use 1½ inch iron pipe with threaded fittings. The trap used is a half S sact trap provided with a cleanout plug at the bottom, for use in case it becomes clogged. Elbows, tees, etc., used in connecting the waste pipe should be special drainage fittings if they can be secured.

" 'It will be necessary to have a special fitting to attach an iron pipe to the sink.

" 'Occasionally a lead trap is used beneath the sink, and sometimes this is attached to an iron waste pipe. This connection can be made with an ordinary cast union (a union with a brass seat is better). Screw the lead pipe into the half of the union having the brass seat until it projects through about ⅜ of an inch; then flange over. The flange on the lead pipe will serve as a gasket.

" 'The best location for the grease trap is close to the cellar wall. This location reduces to a minimum the possibility of clogging in the sewer.

" 'Procure a barrel of large size; it need not be perfectly tight. Dig a hole in the ground close to the wall at the point where the waste pipe comes through. This hole should be about 8 inches larger than the diameter of the barrel and about 15 inches deeper than the barrel is high.

" 'Put about 3 in. of concrete in the bottom of the hole and tamp down. About 16 inches of the lead waste pipe should extend into the hole. It need not be bent downward until after the barrel has been removed. Place the barrel in the center of the hole, letting the waste pipe rest on top of the barrel; then fill around the outside with concrete. When nearly full remove the upper hoop of the barrel and cut a notch deep enough to receive the waste pipe. At the point where the tile drain is to be attached, leave a notch deep enough for the outlet tile elbow.

" 'Remove the barrel when the concrete has set, bend down the waste pipe as shown in Fig. 12, and the outfit is ready for the drain and elbow to be attached.

" 'The tile from the grease trap may be run directly into the farm drainage system if convenient, or, if the soil is sand or gravel, about 75 feet of ordinary drain can be attached to the trap. If the soil is clay, it may be necessary to put six inches of gravel in the trench before putting in the tile.' "

Dan laid the bulletin one side and yawned, his father looked at his watch.

"Why it's a quarter past ten," exclaimed Mr. Baxter. "Time all good boys like you and I were in bed."

He rose and stretched.

"We'll go to town tomorrow and get that stuff," he remarked to Dan as the latter sat removing his shoes. "And maybe mother won't be glad when we tell her in the morning—yes, maybe she won't."

With a pleasant "Goodnight" Dan went to his room. His father knocked the ashes from his cold pipe and as he turned out the light he mused to himself:

"The trouble with us menfolks is that we don't always appreciate the women, and what they do for us. Guess I'd better figure on putting in running water and the fixtures that go with it this fall."

(Editor's Note: We are indebted to Prof. O. E. Robey, Extension Specialist, M. A. C., for the facts used in this article and cuts used to illustrate it.)

POWER FROM STREAM TO RUN GENERATOR

Continued from Page 10)

able that it would be possible to make more than one-third of this amount available for actual power which would be not more than one-quarter H. P., this would be sufficient to operate a few lights without storage batteries, provided it would not have to be transmitted a great distance.

It might be possible that one of either two plans of storage could be used in this case. If a reservoir could be built to store the water then a large flow might be used for a shorter period of the day. To illustrate one-quarter H. P. useable for 24 hours of the day would be equal to 1 H. P. useable for one-quarter day or 6 hours or 2 H. P. for 3 hours. If the water was stored so that the light and power could be used only as needed then a larger wheel and generator could be used, probably this would be a more practical installation. However if developed at the slower rate through the stored in a 16 cell battery so as to generate 32 volts.

Home made machines could be constructed for this purpose but are rather impractical because they do not show very high efficiency. It is very likely with the amount of head available the water-wheel would be found more practical than the turbin.—H. H. Musselman, Professor of Farm Mechanics, M. A. C.

QUACKGRASS DIFFICULT TO EXTERMINATE

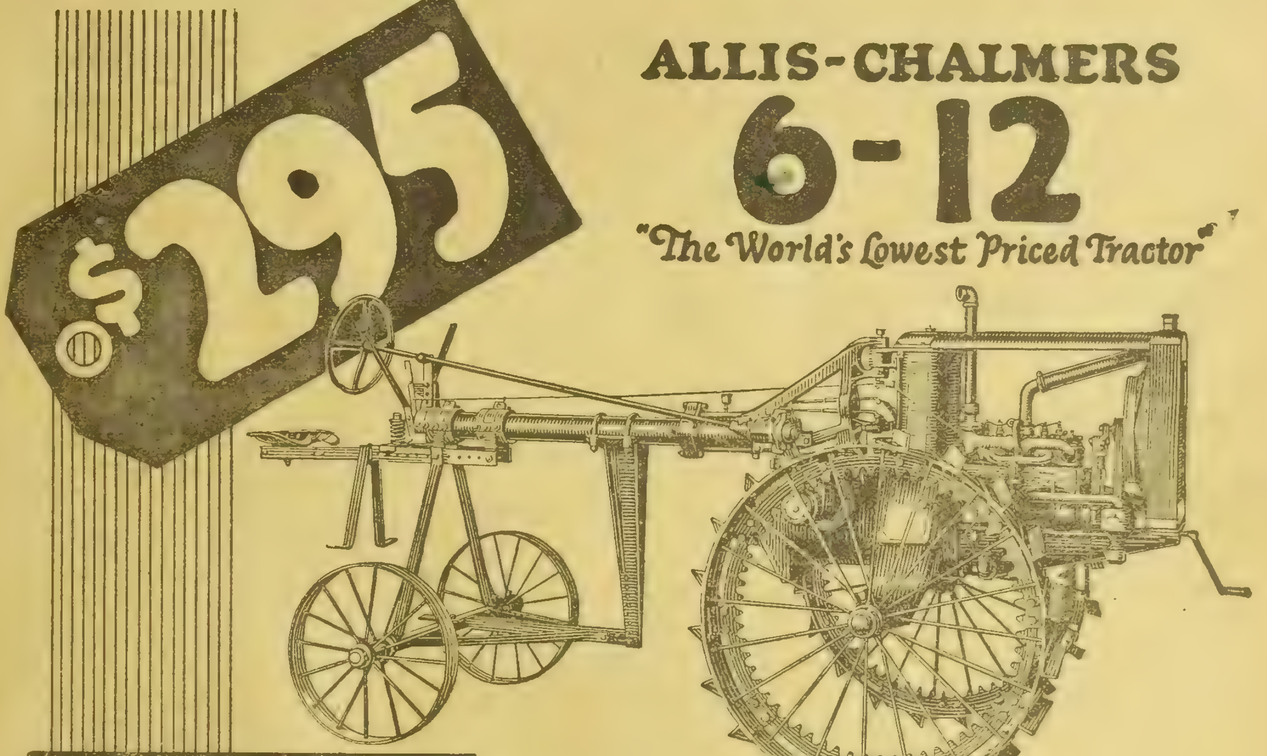
QUACKGRASS can rarely be exterminated on large areas, but it can be brought under reasonable control, says the United States Department of Agriculture. The best plan, according to Farmers' Bulletin 1307, Quackgrass, by L. W. Kephart of the Bureau of Plant Industry, is to allow it to form a sod and then plow it in midsummer during dry, hot weather. After plowing, the field should be harrowed frequently until winter and the following year planted with a cultivated crop.

To be effective against quackgrass cultivation and harrowing must be thorough, frequent, and persistant. Half way cultivation is worse than none. Certain systems of cropping are suggested in the bulletin as a means of holding quackgrass in check on large areas. The use of smother crops that make a heavy, dense growth and kill the weeds by crowding and shading is also suggested under certain conditions. Miscellaneous methods of control for small areas are discussed. On small patches tar paper covering can be used effectively to smother the quackgrass, but this method is too laborious for large areas.

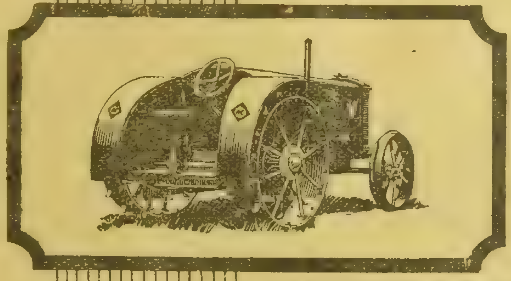
Those interested in the methods of quackgrass control may have the bulletin free of charge by writing to the U. S. Dept. of Agriculture.

WANT A NEW ACCOUNT BOOK?

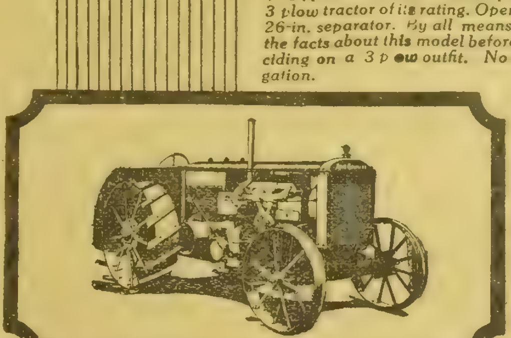
The Papec Machine Co., 178 Main St., Shortsville, N. Y., offer again this year to send readers of the Business Farmer a copy of their new 50-page Farmers Record and Account Book, free if you mention the size of your silo and the name of your implement dealer. There is no other obligation involved. Better send for your copy now!



ALLIS-CHALMERS 6-12
"The World's Lowest Priced Tractor"



The A-C 15-25 is the lowest priced 3 plow tractor of its rating. Operates 26-in. separator. By all means, get the facts about this model before deciding on a 3 plow outfit. No obligation.



Here is today's most popular 4 plow tractor in the grain states. Chosen for its low upkeep, high efficiency and rugged power at draw bar or belt. Handles 28-30 inch separator.

An "Advertising Price" that Saves You $500!

ONLY $295 for this genuine Allis-Chalmers 6-12 tractor! A $500 saving on the former retail price of $795 on this machine!

Based on the hundreds of new friends made for the complete Allis-Chalmers line of tractors last year by a similar reduction, again we offer a limited number of this special model.

Cheaper than any portable engine of equal horse power; broader utility and far greater convenience. 12 H. P. at belt; 6 at the drawbar—just right for hay loader, binder, manure spreader, sulky plow, seeder, mower, etc. Power to do 99% of your own belt jobs.

For the Farm which Requires More Power

Never have so many larger tractor farmers replaced present equipment with either the Allis-Chalmers 15-25 or 20-35, illustrated at left. Seven years and three million dollars were spent designing, testing and retesting these models.

ALLIS CHALMERS

A GARDEN SONG

HERE, in this sequestered close
Bloom the hyacinth and rose;
Here besides the modest stock
Flaunts the flaring hollyhock;
Here, without a pang, one sees,
Ranks, conditions, and degrees.

All the seasons run their race
In this quiet resting-place;
Peach, and apricot, and fig
Here will ripen, and grow big;
Here is store and overplus—
More had not Alcinous.

—Austin Dobson

GETTING THE GARDEN SPIRIT

WHEREVER there is soil, plants grow and produce their kind, and, all plants are interesting. Every family should try and make their home their castle and be proud of it. What difference does it make it you do rent the land. The outside of one's home speaks very plainly what kind of folks dwell within. One plant in a tin can may be a more helpful and inspiring garden to some mind than a whole acre of lawn and flowers may be to another. The satisfaction of a garden does not depend on the area, nor happily on the cost or rarity of the plants. It depends on the temper of the person. One must first seek to love plants and nature and then to cultivate the happy peace of mind that is satisfied with what they have.

We are won't to covet the things that we cannot have, but we are happier when we love the things that grow because they must. A patch of lusty pigweeds growing and crowding in luxuriast abandon may be a better and more worthy object of affection than a bed of coleuses in thich every spark of life and spirit and individuality has been sheared out and supressed. The man who worries morning and night about the dandelions in the lawn will find great relief in loving the dandelions. Each blossom is worth more than a gold coin, as it shines in the sunlight of the growing spring, and attracts the insects to its bosom.

Little children like the dandelions. Why not we? Love the things nearest at hand; and love intensely. If I were to write a motto over the gate of a garden, I should choose the remark that Socrates the great philosopher made as he saw the luxuries in the market: "How much their is in this world that I do not want."

VEGETABLES AS HEALTH-BUILDERS

IF any of you folks attended Farmers' Week in Lansing this winter I am sure you must have been impressed with the wonderful program of talks on life on a farm and some of the remedies these speakers tried so hard to have the farm mother take home with her.

It is hard to make our women folks believe they are not bringing up the family right. Too little has been said to help us realize the importance of vegetables in our diet and the wonders that these vegetables do for our bodies in making us strong and healthy.

Altho strange as it seems, the farmer usually tills his fields and raises food for the market and the garden for the family is forgotten.

Why not this year have a small plot laid aside and have the children take an interest. Make them feel responsible for the weeding and if it is necessary and I think it only right, suggest a small amount to be paid them or else the promise of the treat in town when you go.

Children are told to eat carrots if they want color in their cheeks and beets to be strong and able to romp and play. Just how much there is to this is hard to say, but all the root crops are rich in vitamines and the elements that aid digestion. Carrots are rich in the coloring matter known as "carrotin," which is also present in green grass and gives the rich color to the cow's milk during the early summer. Radishes are effective for warding off scurvy and similar disorders and are eaten more as a salad than a true vegetable.

Root crops such as carrots, beets, parsnips and salsify, yield large quantities of actual food from a small space of ground and for this reason are adapted for growing in the small garden. Parsnips may be grown as an early spring crop in the south and used before the extremely hot weather of summer. In the north parsnips require the entire growing season for their development and may be left in the ground during the winter and to a certain degree improve with freezing.

The Farm Home
A Department for the Women

Edited by MRS. ANNIE TAYLOR

HOW TO EARN MONEY AT HOME

THERE seems to be a call from all the women to help in some way to swell the bank account. It just seems possible that some work could be done at home and a little spare time taken to do or make these things that will bring in more money. Surely there are some of our readers who have found a way to help and I think a good plan would be to pass it on. Tell me your experience, how you go about the task and some idea of how much time is spent upon the enterprise. Tell me approximately how much money you think you have made by these efforts. I have received several letters asking me how my readers could make a little extra money. Let us try and help our neighbors by telling them of our own experiences. God has made us all alike in our desisres and it just seems that some have more fore-sight than others but we all can have the same ambitions if we only know how to go about our tasks.

Your Friend,
Mrs Annie Taylor

Address letters: Mrs. Annie Taylor, care The Business Farmer, Mt. Clemens

The essentials for growing root crops are a deep, rich, well-drained soil, good seed proper thinning and frequent shallow cultivation. None of the root crops, with the possible exception of beets, can be transplanted successfully as the breaking of the tap root in transplanting causes them to grow rough and distorted. The proper method is to spade and pulverize the soil 8 to 10 inches deep, working fine fertilizer to the full depth of spading, then sow the seeds where they are to grow and thin out the plants so that every plant left has room to develop. In the case of beets what appears to be a seed is really a seed "ball" containing one to three seeds, consequently beets usually come up much thicker than the gardner expects. Carrot and parsnip seed lose their vitality or power to grow very quickly and seed of last year's production should always be used.

When it comes to planting the beets, carrots and other root crops the soil which has been spaded and fertilized should be raked smooth and the little rows or furrows formed by means of the hoe handle or a rounded stick drawn along a tight line. The distance between rows may be about 18 inches for beets and carrots and at least 24 inches for parsnips and salsify. The seeds should not be covered more than one inch deep on sandy land and less on heavy soils, and the soil used for covering them should always be fine and mellow. If the soil is in the least dry it should be firmed over the seeds by laying a board on top of the row after the seeds are covered, then walking on the board.

Beans and peas make muscle and backbone.

BLUE AMONG YOUR FLOWERS

BLUE is a color that is not common among garden flowers, and yet there are some very pretty blues we may have. The blue cornflower has long been a garden favorite. No blue makes much of a showing unless planted with white or perhaps a decided pink or bright red. In some cases several colors are combined. I do not like these mixtures, however, as one companion color with blue always looks best.

White sets off the blue without being too "showy," or in a background where display is desirable bright red is effective with a bright blue. Altho the cornflower (centaurea cyanus) is planted more than any other tall blue flower, there are five blues among the annual larkspurs and asters which are very desirable. Larkspurs bloom a long time in summer, and the asters bloom late in the fall when the flowers are scarce.

Larkspurs are more showy than cornflowers. Whites and reds can be obtained in each of these, or some other flower that is taller and blooms with them may be used as a background. Nicotiana makes a nice companion plant to grow with cornflowers. Asters, however, are massive flowers, so are prettier when grown in a mass with whites or reds of the same flower.

Ageratums, pansies, verbenas and lobelias are all low growing flowers with good blues. The ageratum comes in blue and white only. It is easy to grow and quite popular, but I do not admire it very much. The verbena is one of our finest flowers a trailer much valued for planting among gladioli or other tall plants. The pansy is too well known and loved to need praise. The lobelia is not so well known as it deserves, for it is very pretty, grows low, is compact, likes shade and is an intense blue.

BIRD HOUSES ON THE GROUNDS

THIS year would be a splendid one to have John build you a bird house or purchase one. Birds are one of our best friends and they help in their own way to prevent insect life getting too far with our trees and shrubs. A bird making ready his home for the mate teaches us humans a great deal in love and respect. They bring happiness untold with their songs of love.

Henry Ford is a great lover of birds, and his home and other properties he owns are just alive with birds making their nest ready in the many bird-houses he has had put up on his ground. Let us take a little while this spring and see if we cannot improve our surroundings.

SWEET PEAS FOR EVERY GARDEN

THE sweet pea deserves a place in every garden for it is not to be surpassed by any other annual when it comes to beauty, fragrance, range of color, and usefulness for cut flowers.

For early flowers the winter flowering type is useful. The Waved or Spencer varieties are much superior to the Grandiflora varieties. These are older types of the flower which will be discarded by all growers of sweet peas when once they have tried the Spencer variety with the long stems and beautiful waved edges.

Location and Soil

Choose a site for your sweet peas that will give them plenty of sun and allow you to run the rows north and south, for by so planting, the tops shade the base of the plants and keep the soil cool.

Sweet peas will grow in any good garden soil if it is well drained so that the water does not stand around the plants during rainy periods. Although ordinary preparation of the soil will give reasonably good sweet peas if the season is favorable; if the summer is hot and dry, the peas will bloom for only a short period. If the soil has not been prepared in the fall, the first thing to do as soon as the ground will allow working is to spade a trench about a foot wide and approximately two deep. If the subsoil is not good, it should be removed and replaced with good garden loam which has been mixed with well-rotted manure. A heavy application of superphosphate of lime should be worked into the soil. Sweet peas do best in heavy soil if it is sweetened with lime and loosened with manure. By all means plant your peas as soon as you can work the ground so that they get a good root development.

As soon as the plants send forth tendrils, some support should be provided. In the country where good twiggy boughs are easily obtained, such support is best.

Sweet peas make a beautiful boquet with baby breath.

GREENS AS A MEDICINE

ONE of the ways of preventing the human system from suffering from digestive monotony is to provide plenty of green or leaf vegetables in the diet. Fresh green food not only serves as the broom for the stomach, but supplies the human system with the mineral elements that are so essential to health.

Spinach, kale, mustard, dandelion, sour grass and other kinds of greens taste best in spring because they are more tender and fresher at that time.

By the use of coldframes, coverings of straw or pine boughs and other means of protection, spinach and kale may be carried through the winter rather far north.

Beds on which late fall, winter and early spring kale and spinach are grown should be raised three to six inches above the surrounding surface so as to drain well. They are best located on a southern of eastern exposure to get the full benefit of the sun. A shelter of pine boughs or corn fodder along the north and west sides of the beds is a great protection against cold and wind. Plenty of fertilizer is essential where fall plantings are made for spring use.

Highly nitrogenous fertilizers should not be applied until after the cold weather or until active growth of th plants begins.

The season for greens on the table can be prolonged during the spring and summer. Mixtures of young, tender beet tops, swiss chards, mustard and other greens may be made. In combining the mixture for canning only a small proportion of mustard or of any pungent green material should be used.

Mothers Problems

TRAIN CHILDREN TO MEET EMERGENCIES

NO child is too young to be trained for an emergency: yet accidents, with their terrible consequences, are not good subjects for a child to dwell upon. The knowledge of "what to do if——" must be imparted in a pleasant way—and there is no pleasanter way than by means of a game which Mother and the children can play whenever they are together.

Says the mother: "What would you do if your clothes should ever catch on fire?" The children will probably give varying answers, some good, some highly impractical, even dangerous. Finally the mother tells what she would do, which is, of course, the correct course to pursue in such an accident.

It is then time for the child who gave the best answer to ask Mother a question. She may think of some big accident, such as burning, drowning, being run over and the like, as she may be more interested in knowing what Mother would do in case her "nose got to bleeding and wouldn't stop," or she "got caught in a snowstorm and couldn't see a thing." In either case the information gained would be invaluable if ever she was called upon to meet such an emergency.

Far fewer fatalties would result from accidents if people were only trained to do the proper thing. Mothers who play this game with their children will find out that they must study up on "emergencies and how to meet them," in order to impart

TIME EXTENDED TO WEDNESDAY, APRIL 18TH FOR GARDEN LETTERS

IN order that all our readers might have an opportunity to send in their suggestions on making the front of the house beautiful with flowers and shrubs with the least cost possible, we are extending our contest over to the next issue and will then print some of these suggestions.

SULPHUR AND MOLASSES

By JAMES M. WOODMAN

In them good old days back yonder th' home-folks useter make
Th' tonics which our mothers were so prone t' have us take,
When th' Springtime's balmy breezes began t' gently blow—
They had th' modern "dopes" outclassed a mile, I'd have you know.
E'en now I see our healthy brood, each take his turn by gee!
When mother dealt th' sulphur an' molasses out t' me.

Some folks tuk sassafras, an' some, et slipp'ry elum bark;
An' some used yaller-dock, but say! jest please let me remark
Uv all th' tonics ever made t' set yer teeth on edge,
An' make y' squirm an' argue back, an' duck around and hedge;
If there is anything on earth, much worse, what could it be
Than that old sulphur aad molasses mother gave t' me.

Ef I should live a millyun I don't think I'd forget
Th' taste uv that old medicine—by jing! I see it yet
Up in th' big old tumbler glass, upon th' kitchen shelf,
A-sort o' sayin' "come along, old chap, an' help yourself."
Still, could I be a boy again, I'd take it willingly—
Th' sulphur and molasses which my mother gave t' me.

the correct knowledge to their children. And they will find that their children will think up all sorts of accidents which it had never occurred to them to warn against.

What would you do if—— "you tumbled into a well?"——"if you almost stepped on a rattlesnake?"——"if you swallowed a penny?"——"if you nearly cut your foot off and nobody was at home?" Such questions your children would like to have answered, and ought to have answered. Could you answer them? If not, "brush up" on first-aid and interest the children in the "game" mentioned above.—Margaret Bartlett.

Personal Column

Would like to know if any reader has the story "Pam De cides" by Betlina Van Hutten? If so, will they sell it or lend it, or exchange it, and for how much? I have the first story, "Pam". Would like very much also to secure the Geographical magazine for January, February, March, April, 1923. Willing to buy or exchange magazines such as Ladies' Home Journal, Woman's Home Compaion, McCall's, Today's Housewife, and Saturday Evening Post. Or, I have a year's number (1922) of The Mentor, that I would exchange for these numbers of The Geographic.

Is there any one having a receipt for canning horse-radish, so it will keep.—Mrs. C. F.

Miss M. M.—Here is the poem you asked for and I hope it will bring you much joy. I could buy this in sheet music for the piano if you care to send the money. I think I could get it for twenty-five cents. Verse sent in by Mrs. Harvey Gable, Ithaca, Michigan.

ALWAYS IN THE WAY.

Please Mister take me in your car
I want to see my mama
They say she Lives in Heaven
Is it very very far.

Cho.
Always in the way
So they always say
I wonder why they don't kiss me
Just the same as sister May
I dare never play
My own mother would never say
You're always in the way.

The song it ended all to soon
She tottled off alone
A Light shone in the window
And she peeped into the room
Please tell me is this Heaven
And will they let me stay
Forever child for this is Heaven
And you are not in the way.

One of our readers would like to know if any one as the song, "I Hain't Got Nobody to Make a Fuss Over Me."

Will subscriber who makes sweaters, bonnets, door-panels and table-runners please send in her name again and let me know all about her work. Have several letters asking for this information.

Sometime ago a reader sent in a remedy for eczema and we have had a request asking for this same remedy to be printed once more. Would appreciate receiving it as one of our subscriber's sons is suffering right now.

FOR CLOUDY EYE-GLASSES

Keep a small bottle of half water and half household ammonia to clean your spectacles. A drop or two and a clean cloth will make them shine.

The Runner's Bible

FOR him who must run and yet would read, and particularly for her who at seventeen has already begun to run, these commands and promises of Holy Writ are gathered and grouped by one who while running has felt the need.

I am going to give you a few thot's each week from this wonderful book and let us try and see if it will not help to make our days happier for having read them.—

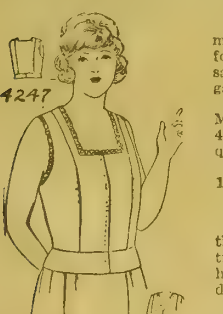
There is nothing as important when making ready for the day as an early morning period of stillness werein to make sure that the Truth and the Truth only, controls our consciousness, However that the consciousness may be clear enough to percieve the Truth, we must let go of our thot's oud sensatious of the material world (Ps. 46:10) and know that all that truly exists is Good, and determine to know nothing else.

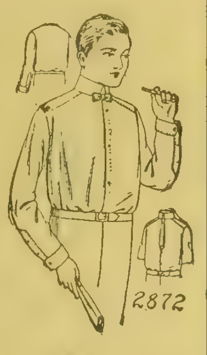
—if you are well bred!

"Etiquette, remember, is merely a collections of forms by which all personal contacts in life are made smooth." Here is the whole thing in a nutshell. No argument could be stronger.

AIDS TO GOOD DRESSING

THE vogue for one-piece frocks has made the top coat and wrap a necessity. And the new spring models are not only necessities, but are things of rare beauty and convenience, and there are wraps and coats for all occasions and ones for general were as well. The cape is considered the last word in all our large cities, especially New York. Any good coat material for summer suiting cloths in plain colors such as black, tan, brown, navy,-blue are very popular. Will try and have some patterns in next issue.





A Model Good For Stout Figures

4247. This corset cover is ideal for the woman of mature figure. The seams may be boned for firmness. Nainsook, cambric, linen, silk or satin may be used to develop this comfortable garment.

The Pattern is cut in 4 Sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A Medium size requires 1⅝ yard of 36 inch material.

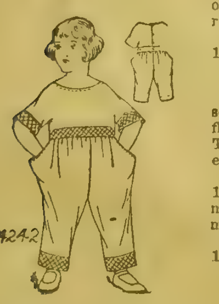
Pattern mailed to any address on receipt of 12 cents in silver or stamps.

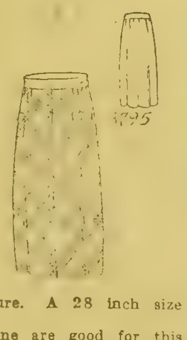
A Practical Play Suit For Boy or Girl

4242. Here is a new and pleasing version of the Romper style, with outstanding pocket sections, and comfortable sleeve. Chambrey, gingham, khaki, linen and cretonne are good for this design.

The Pattern is cut in 5 Sizes: 2, 3, 4, 5 and 6 years. A 4 year size requires 2⅛ yards of 36 inch material. To trim as illustrated will require ⅜ yard of 36 inch contrasting material.

Pattern mailed to any address on receipt of 12 cents in silver or stamps.





A Popular Model

2872. This style is good for madras, percale, soisette, silk, cambric, khaki, muslin, linen and flannel. The fronts are finished in coat style. The sleeve may be finished with the cuff or in elbow length.

The Pattern is cut in 8 Sizes: 15, 15½, 16, 16½, 17, 17½, 18 and 18½ inches neck measure. Size 16 requires 3⅝ yards of 36 inch material.

Pattern mailed to any address on receipt of 12 cents in silver or stamps.

A Good Skirt Model

Pattern 3795 was used to make this style. It is cut in 7 Sizes: 24, 25, 28, 30, 32, 34 and 36 inches waist measure. A 28 inch size requires 2⅜ yards of 42 inch material. The width at the foot is 2 yards.

Serge, mohair, duvetyn, tricotine, prunella, broad cloth; velvet and gabardine are good for this practical design.

A pattern of this illustration mailed to any address on receipt of 12 cents in silver or stamps.

DAIRY and LIVESTOCK

MARKETS WANT LIGHTER WEIGHT LAMBS

THE number of heavy, fed lambs weighing from 45 to 50 pounds dressed weight marketed during recent months has been considerably in excess of the demand. An investigation recently made by the Bureau of Agricultural Economics, United States Department of Agriculture, to determine the reasons for the discrimination against heavy lamb developed the fact that hotels, restaurants, railroad dining car systems and steamship lines are able to utilize heavy lamb cuts to advantage, but that the average housewife, with a small family considers lighter weight cuts more economical for family use.

As a result of improved breeding for the production of wool and mutton, flocks in general have increased somewhat in average weight. Producers complain that they are unable properly to furnish lambs for the market under 90 to 100 pounds, which means a dressed carcass weighing from 45 to 50 pounds. On the other hand, consumers' preference has turned toward lighter cuts of all classes of meat, and for this reason heavy lamb has ben at a disadvantage. The additional amounts of fat found on heavy lamb cuts is also responsible for some of the prejudice against this class of meat, as lamb fat is not relished by most meat consumers.

A cutting test was recently made by the department on five light and five heavy lambs of good grade. The light lambs averaged 33 pounds and sold at wholesale at 26 cents per pound. The heavy lambs averaged 45.80 pounds and brought 24 cents per pound wholesale. The price of the light lambs therefore was $8.58 and that of the heavy lambs $10.99. In other words the heavy lambs were worth $2.41 more than the light lambs on a carcass basis. The carcasses were divided into the usual wholesale cuts, namely rattles, racks and saddles, and the percentage weights of these cuts were practically the same in both instances.

The rattles, consisting of the shoulder, neck and breast, and the racks, of 8 ribs, were valued at 12 cents and 4 cents per pound respectively in both cases. However, the saddles consisting of the leg and loin, sold at 34 cents per pound when cut from the light lambs, while the heavy saddles sold at 30 cents per pound. The higher prices which retailers were willing to pay for the former is due to the consumers' preference for light legs of lamb.

Retail prices at cash and carry and credit and delivery markets during the same period were as follows: Legs 35c-45c per pound, loin and rib chops 45c-60c, breast for stewing 10c-15c, shoulders 20c-25c. These prices represent the general range covering retail cuts from light and heavy lambs.

Most retail dealers who cater to family trade are averse to purchasing heavy lamb except in limited quantities on account of the difficulty of disposing of the legs. The greatest demand is for legs of lamb weighing from 5½ to 6 pounds These are obtained from lambs weighing from 33 to 35 pounds dressed weight, whereas a 45 to 50 pound lamb produces a leg weighing 8 pounds or more. Some retailers have attempted to solve this difficulty by cutting off enough chops or steaks from the leg to reduce it to the most desired weight, and others have made price differentials amounting to fully 6 cents per pound in favor of the heavy legs, without being able to materially widen the outlet.

Forequarters, which are used for stews, roasts and shoulder chops, can easily be divided into cuts of any desired weight, and for this reason little distinction is made in prices between light and heavy rattles, unless the latter are excessively fat. Furthermore, little difficulty is experienced in disposing of the racks when cut into rib chops. However the housewife who plans to purchase a certain number of chops for a certain number of people, dislikes to buy an extra pound or more of meat at present prices to provide the requisite number of chops. This has had the effect of reducing somewhat the sale of heavy chops, although not to the extent of causing a material difference in price, as chops are in fairly good demand most of the time.

The tendency toward lighter cuts of meats is not confined to lamb. As a result of the demand from consumers for lighter cuts, the average weight of beef cattle marketed has been tending lower for the past several years. Beef producers have recognized this and have changed their methods of marketing accordingly.

Apparently the problem for the lamb producer is to determine whether he will realize the greatest net return by marketing his lambs at an earlier age and at lighter weights thereby obtaining a higher price, or by producing heavier lambs and trusting the increased weight to compensate for the lower price per pound which he will have to accept.

RUSSELL BROTHERS' SALE OF ABERDEEN ANGUS

ALTHOUGH our sale did not break any records for high prices, we feel that it was above the average make by a good many pure bred sales held in the last year. A average of $128.00 per head was made on females. Hall Orchards, Inc., of Belding, Michigan, took the largest alotment and tops of the sale. The remainder went to Gratiot, Isabella and Saginaw counties to found new Aberdeen-Angus herds. We have every reason to believe these cattle will do good in their new homes and create a demand for more Aberdeen-Angus. Thanking you for the good work, our advertisement in your paper did for our sale and assuring you our patronage in the future, we beg to remain, Russell Bros., Merrill, Mich.

GRATIOT LIVE STOCK ASSOCIATION FORMED

PERHAPS the most concerted move ever attempted in Gratiot county to put the county at the top of the list as a good livestock center was started at the Farm Bureau office in Ithica, Saturday, March 17th, when the Gratiot Live Stock Breeders' Association was formed. Original intent of the meeting was only to find out the sentiment of the breeders toward a general organization. The discussion brought out so many benefits possible that an organization was effected and committees appointed to promote the various activities desired.

VETERINARY DEPARTMENT

TREAT HOUND FOR BEALED EARS

What will it be necessary for me to do in treating a hound for bealed ears? He wants his ears ruffer and they irritate him very much.—E. S., Winegar, Mich.

—Wash and disinfect ears thoroughly, dry and apply zinc oxide ointment to bealed parts and then apply a bandage loosely over the head to keep the hound from shaking the ears until they are well. It will be necessary to repeat the treatment daily.—Prof. John P. Hutton, Dept. of Med. & Surg., M. A. C.

CASE INCURABLE IF OF LONG EXISTENCE

I have a two year old heifer that is out in both stifles and I don't want to kill her if I can do any thing for her.—C. M., Macomb County, Mich.

—You do not say how long this conditions has existed. I judge from however, that is a chronic condition. If so, it is incurable. The best thing to do would be to send the heifer to the butcher at once.—John P. Hutton, Assoc. Prof. of Surg. and Med., M. A. C.

COLT BOTHERED WITH LICE

I have a three year old colt and I curry and brush him every morning and for the past month he is troubled with lice. Will you please tell me some good remedy.—G. M., Bay City, Mich.

—Lice are blood-sucking parasites. Each of the domestic animals harbors its own species. Occasionally lice will pass from one host to an-

other of a different species. Chicken lice will attack horses and human beings. A two per cent solution of creolin rubbed well into the skin with a brush is good treatment, a warm day, however, needs be selected for a treatment of this kind. If the colt has a heavy hair coat have him clipped then apply above treatment.—John P. Hutton, Assoc. Prof. of Surg. & Med., M. A. C.

THE EXPERIENCE POOL

Bring your everyday problems in and get the experience of other farmers. Questions addressed to this department are published here and answered by you, our readers, who are graduates of the School of Hard Knocks and who have their diplomas from the College of Experience. If you don't want our editor's advice or an expert's advice, but just plain, everyday business farmers' advice, send in your question here. We will publish one each week. If you can answer the other fellow's question, please do so, he may answer one of yours some day! Address Experience Pool, care The Business Farmer, Mt. Clemens, Mich.

CURE FOR COW POX

In your issue of March 17th, V. B. Drwyden wants a cure for cow pox. I have been in the dairy business for 25 years and find the following a sure cure: Take well salted butter and put in enough carbolic acid to singe the scores. Apply to the scores and it will heal them up and kill the germ. It is also good for barnyard itch or ring worms, but do not use quite as much acid.—H. E. Coblentz, Charlevoix County.

REMOVING WARTS

I read in the Business Farmer of March 17th about removing warts on cattle. Several years ago I had a fine heifer that had warts on the side of her head covering a space as large as a saucer. I removed them inside of four weeks by greasing them four or five times with caster oil. It will not leave any scars.—W. L. Hersha, Charlevoix County.

TO CURE HENS OF EATING EGGS

"How can I keep my hens from eating eggs?" was asked in a recent issue. I am not an inventor but have made a great many useful articles and here is one. Take an old cheese box, bore a 2¼ inch hole in the center of the bottom. Then take some straw or old burlap (burlap is better) and put it around the edge of the inside of the box. Take 6 or 8 strips of burlap and tack one end of each strip to the top of the box and the other to the edge of the hole. The strips are to be placed at an even distance from each other around the edge of the box. When you have this completed take a piece of burlap a little larger than the top of the box and cut a hole in the center large enough to allow an egg to pass through easily. Then place the burlap across the top of the box allowing the center to sag until it touches the bottom of the box with the hole in the burlap coming directly over the one in the box. Tack the edge of the burlap to the top of the box and your job is done. Now put the box over a nest where the hens lay and you will laugh to see the hen that lays and eats her eggs when she looks for the egg and cannot find it.—C. E. S., Glennie, Mich.

ANOTHER WART REMEDY

I know from my own experience that warts on a cow can be cured and are not very hard to cure either. Just take a pair of sheep shears and clip off the tops of warts and apply a mixture of sulphur, caster oil and salt. Sulphur and salt equal parts and enough caster oil to make a paste just thick enough so it will not run. Apply this every third day and within six weeks you will find all your warts will be gone.—Alex Bruce, Huron County.

The insurance man was putting questions to a former cowboy, as he wrote out his application.

"Ever have any accidents?"

"No," was the reply.

"Never had any accidents in your life?"

"—ope. A rattler bit me once, though."

"Well, don't you call that an accident?"

"Hell, no! He bit me on purpose!"

Wanted—General office position by young married man with five years experience.—Wausau, Wis., Record-Herald.

"As a mortgage lifter the hog has nothing on a De Laval Cream Separator"

"My work as field man for the Wisconsin State Dairymen's Association," says Herman Marx, in a recent letter, "brings me into contact with a great many farmers and a great many separators. Of all the farmers who own separators, I find about 80% of them own a De Laval.

"For close skimming, low upkeep, easy running and long life it is hard to beat a De Laval. I have adjusted a good many separators and I find that the easiest one to adjust is a De Laval.

"A hog has always been called a mortgage lifter, but he has nothing on a De Laval Separator. I have known several instances where the buying of a De Laval in place of some other they were using saved enough money to pay the interest on a fair sized loan."

—A remarkable tribute to the De Laval Separator, not only because it shows that the majority of experienced farmers in the great dairy state of Wisconsin use and appreciate the De Laval, but because it proves that it makes them money as well.

The present De Laval is the best De Laval Separator ever made. It skims cleaner, lasts longer and is easier to clean and operate than any other. It will pay for itself in a year's time, and is sold on such easy terms that you can use it while it is doing so. See your local De Laval Agent or write us for complete information.

DISSOLUTION SALE!

Bon Ayre Farm Guernseys

OWNED BY

WIGMAN & SURATO, HOLT, MICH.

May, 9th, 1923

65 Head of high class, pure bred GUERNSEYS **65**

This great herd of cows, several with fine official records, together with their offspring, make an aggregation that has rarely been placed at the disposition of the buying public through the medium of the auction sale ring.

Included will be 20 daughters of Uplands Monarch of the May, a grandson of Ne Plus Ultra out of Ellen May Queen of Glenmore with 16369 lbs. milk and 816 lbs. fat. All females of breeding age are bred to May King's Prince of Bon Ayre (1st at Mich. state fair 1921), a son of Uplands Monarch out of Gala of Weston with 13545 lbs. milk and 760 lbs. fat.

IT Is THE BEST

THE PRICE IS RIGHT

STANDARD BINDER TWINE

Are you remembering in purchasing your binder twine that you have a factory of your own at Jackson?

It is making the best twine that can be placed on the market and has a mixture of fiber this year. Manila is added to the sisal to give extra strength.

The State Farm Bureau and other organizations and dealers of the state are in position to handle your twine. If they do not, write direct for prices as we want you to use your own twine as we make 14,000,000 lbs. more than Michigan can use.

PETOSKEY Potatoes

"Rural Russets"
King of the Late Potatoes!
Resists heat, drought and disease.

Potato producers growing for market or home consumption are paying 100% production costs for 65% crops. Disease takes the other 35%.

Some diseases can be controlled by spraying—some by seed treatment—but others, some of the worst, can be controlled only by planting disease free seed.

Michigan certified seed potatoes are the best insurance for 100% production.

Safe requirements for certification and rigid inspections eliminate diseases.

If your Local Cooperative Association or County Agent cannot take your order write to

Michigan Potato Growers' Exchange
Cadillac, Michigan or

Michigan State Farm Bureau
SEED DEPARTMENT
Lansing, Michigan

Give your potato crop the right start by planting the best seed.

Better Potato Prices Expected This Year

IT is not my intention to pose as an expert nor as a large grower with a liftetime of experience; but I have raised a good many potatoes over a period of several years and it is my opinion that given a normal season and careful attention the 1923 potato crop will again be on the profit side of the grower's ledger.

There will surely be a considerable decrease in acreage this year unless human nature has subjected itself to great and sudden change.

The enormous increase in acreage in 1922 was due obviously to the nice profits obtained by the 1921 grower, and a general feeling that in the face of the disastrous year of small grain anyone who planted potatoes would just as surely take a good profit for his trouble.

Farm papers and near farm papers were full of propaganda, devoting page on page to potato profits, poato culture and seed treatment, grades and what not, until everyone was willing and anxious to snuggle and cuddle up to the winsome spud.

I know of those whose experience was limited to about a couple of rows grown in the garden, plunging in with anywhere from 20 to 60 acres. This may not sound so much to some; but if it is properly and thoroughly done it is undoubtedly "a right smart of a chaw" for those who have yet to cut their wisdom teeth on the ring of experience.

I feel it is safe to opine that, in the face of the high cost of production on last year's crop, the difficulties encountered in transportation and the continued demoralized condition of the market, we will have with us this year very few of last year's fledgings.

For the same reasons, the regular grower who expanded his operations last year will likely drop back to his normal acreage again.

There are many old saws current among us, some wise and some otherwise. One that I have heard many times, most emphatically belongs to the latter class: "Oh! if you can get two bits a bushel you can make a little money on spuds." If this were ever true, it is certainly obsolete under present conditions and methods of culture.

What with scab, wilt and bugs common in all sections, and the blight rapidly encroaching on our territory, 25 cents per bushel falls considerably short of paying for production. With all the material, machinery and labor involved in protecting the crop from pests and diseases, comes a much heavier production expense than was the case when the country was new and spraying and treating were not necessary. The coming of these pests also greatly increased the chances of failure.

Under the conditions existing here in the north central part of South Dakota, where the yield will hardly average 90 bushels to the acre, I hardly think a real profit will materialize much below 75 cents per bushel. When I say profit, I have in mind more than merely getting the cost of production along with ordinary wages for the labor involved. No one takes longer chances than the farmer, and few average businessmen have anything like as much capital invested as has the average land-owning farmer. By the same token, few deserve the same margin of net profit that he should have for bucking these long chances.

While the potato grower is undoubtedly a great gambler, he certainly is not in all cases a good one, as there always has been and probably always will be many who will quit while they are losers and a great many more who in spite of all experience and advice to the contrary, will continue to quit one year and plunge the next in a hopeless attempt to be always on the right side of their pocketbooks.

Another old saw that is current with all, has been handed down from our grandfathers' day and is just as applicable today as the day it was coined: "When everyone else runs, stand still." It is the grower who stays in the game year in and year out who plants potatoes on a plan consistent with the rules of common sense. He knows that over a period of years the good crops will certainly outweigh the bad and when there are any grapes he is there to pick them while the picking is good. It is the guesser, the plunger, and the spasmodic planter that spoil the game for themselves as well as everyone else.

I doubt if any grower ever lost money in a period of five straight years. If we will all do the sensible thing, the conservative and the consisting thing, there should be a nice feeling of satisfaction among us all after shipping time next fall.—J. H. Piercy.

White Diarrhea

Remarkable Experience of Mrs. C. M. Bradshaw in Preventing White Diarrhea

The following letter will no doubt be of utmost interest to poultry raisers who have had serious losses from White Diarrhea. We will let Mrs. Bradshaw tell of her experience in her own words:

"Gentlemen: I see reports of so many losing their little chicks with White Diarrhea, so thought I would tell my experience. I used to lose a great many from this cause, tried many remedies and was about discouraged. As a last resort I sent to the Walker Remedy Co., Dept. 687, Waterloo, Iowa, for their Walko White Diarrhea Remedy. I used two 50c packages, raised 300 White Wyandottes and never lost one or had one sick after giving the medicine and my chickens are larger and healthier than ever before. I have found this company thoroughly reliable and always get the remedy by return mail.—Mrs. C. M. Bradshaw, Beaconsfield, Iowa."

Cause of White Diarrhea

White Diarrhea is caused by the Bacillus Bacterium Pullorum. This germ is transmitted to the baby chick through the yolk of the newly hatched egg. Readers are warned to beware of White Diarrhea. Don't wait until it kills half your chicks. Take the "stitch in time that save nine." Remember, there is scarcely a hatch without some infected chicks. Don't let these few infect your entire flock. Prevent it. Give Walko in all drinking water for the first two weeks and you won't lose one chick where you lost hundreds before. These letters prove it:

Never Lost a Single Chick

Mrs. L. L. Tam, Burnetts Creek, Ind., writes: "I have lost my share of chicks from White Diarrhea. Finally I sent for two packages of Walko. I raised over 500 chicks and I never lost a single chick from White Diarrhea. Walko not only prevents White Diarrhea, but it gives the chicks strength and vigor; they develop quicker and feather earlier."

Never Lost One After First Dose

Mrs. Ethel Rhoades, Shennandoah, Iowa, writes: "My first incubator chicks, when but a few days old, began to die by the dozens with White Diarrhea. I tried different remedies and was about discouraged with the chicken business. Finally, I sent to the Walker Remedy Co., Waterloo, Iowa, for a box of their Walko White Diarrhea Remedy. It's just the only thing for this terrible disease. We raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."

You Run No Risk

We will send Walko White Diarrhea Remedy entirely at our risk—postage prepaid—so you can see for yourself what a wonder-working remedy it is for White Diarrhea in baby chicks. So you can prove—as thousands have proven—that it will stop your losses and double, treble, even quadruple your profits. Send 50c for package of Walko—give it in all drinking water for the first two weeks and watch results. You'll find you won't lose one chick where you lost hundreds before. It's a positive fact. We guarantee it. The Leavitt & Johnson National Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of this guarantee. You run no risk. If you don't find it the greatest little chick saver you ever used, your money will be instantly rerfunded.

WALKER REMEDY CO., Dept. 687
Waterloo, Iowa.

Send me the ( ) 50c regular size for ( ) $1 economical large size) package of Walko White Diarrhea Remedy to try at your risk. Send it on your positive guarantee to instantly refund my mony if not satisfactory in every way. I am enclosing 50c (or $1.00). (P. O. money order, check or currency acceptable.)

POULTRY

POULTRY MORE THAN MERE SIDELINE

THE day of the hit-or-miss method of handling poultry in the United States is over. The farmer considers his wife's chickens as something worth while. Many a farmer has paid his grocery bills the last two years with the returns from the flock of hens that he once looked on as his wife's fad. Today this same farmer is looking for better stock. He says that with good purebred stock he can always get the market for his eggs and surplus birds. However, he finds it difficult to supply the demand for this class of stuff at several times the market price. He has found, too, that there are several things that enter into the poultry business that make it interesting, as well as profitable.

Several years ago E. Philo of Elmira, New York, published book on how to raise poultry on a fifty-foot lot. Since that book first came out there have been several proved tests that the old idea the hen has to have large runs is not altogether correct. Some of our foremost poultrymen of California and the East claim that better egg production is obtained if the hens are confined to pens. Some are using an eight-foot-square pen to care for fifteen hens, or a twelve-foot-square space to accomodate fifty hens, There is one man at Riverdale, California, that has 2,500 hens on one acre that earned $2 per head, last year.

The whole year's profit on an egg farm depends on the kind of chicks and the way they are brooded. Chicks must be from hens not less than two years old, mated to males whose ancestry has been bred for vigor and heavy egg production for generations. Without a vigorous, well-bred chick to start with, nothing can be accomplished. Too many baby chicks are cast upon the beginners that are hatched from pullet's eggs. Nine times out of ten this means disaster right from the start.

After securing good chicks the next step is to brood them properly. I believe the one great mistake in brooding chicks is to put too many together. Nature never intended for 500 to 1,000 chicks to be raised together. Best results are obtained with not over 150 chicks in one flock. It only takes six weeks to brood chicks and poultrymen would find it more profitable to spend more time on quality instead of on quantity. Better take more time and care the first six weeks than to have an inferior bunch of poultry on your hands for the balance of the year. There is a knack in brooding chicks which requires time and study and the more you can give it the greater the success. Good, well-bred from correct matings, not over 150 together in brooders with no foul corners, cleanliness, and good balanced feeds are sure to bring success.

Growing is more than a matter of mere energy relations. It is associated on the one hand with the factors of heredity and evolution, and on the other hand with the factors of environment. The first is sometimes spoken of as the internal factor and the latter as the external factor. As S. D. Wilkins puts it, pronounced results in modifying the external factors is perhaps more quickly realized than in the consideration of the former factors.

While, then, it is important for the breeder to utilize every source of improvement in growing his birds, the part played by the exercise of the external factors warrents much attention and study. At the outset we must realize that neither of these factors are independent of the other.

External Factors

The external factors are represented by such conditions as climate, habitat, temperature, air, food, water, soil, use, and disuse. Without doubt the most important of these is the question of the food supply and since the supply of food cannot stimulate growth beyond the limits predetermined by the internal or growth impulse factor, the importance of understanding fully the feed requirements during the period of growth is at once apparent.

In general, poultrymen consider the nutritive requirements of poultry as being ssatisfied when the ration

Rheumatism

A Remarkable Home Treatment Given by One Who Had It

In the year 1893 I was attacked by Muscular and Sub-Acute Rheumatism. I suffered as only those who are thus afflicted know for over three years. I tried remedy after remedy, but such relief as I obtained was only temporary. Finally, I found a treatment that cured me completely and such a pitiful condition has never returned. I have given it to a number who were terribly afflicted, even bedridden, some of them seventy to eighty years old, and the results were the same as in my own case.

I want every sufferer from any form of muscular and sub-acute (swelling at the joints) rheumatism to try the great value of my improved "Home Treatment" for its remarkable healing power. Don't send a cent; simply mail your name and address, and I will send it free to try. After you have used it, and it has proven itself to be that long-looked for means of getting rid of such forms of rheumatism, you may send the price of it, One Dollar, but understand I do not want your money unless you are perfectly satisfied to send it. Isn't that fair? Why suffer any longer, when relief is thus offered you free. Don't delay. Write today.

DAY OLD CHICKS SINGLE and ROSE COMB RHODE ISLAND WHITES. Write for Catalogue. Fischer's Hatchery and Poultry Farm, R. 1, Holland, Mich.

includes ingredients coming under these units: Protein, carbohydrates, fat, and ash or inorganic material. It is known that protein is required by the body for the production of muscle, carbohydrates and fat to supply heat and energy and build up stores of bodyfat; mineral water to provide for skeleton development.

Until recent years it was believed that any ration which includes these nutriments in variable amounts depending upon the purpose for which the ration was compounded was adequate. Failure to obtain normal growth was attributed to faulty brooding methods, improperly hatched chicks and numerous other causes.

There has come to the knowledge of the poultrymen a new term, vague perhaps, as to its specific meaning, but withal expressive of something significant. The term vitimine suggested by Casimir Funk in 1911 is used to designate a class of substances found in naturally occuring food-stuffs in variable amounts but lacking in many of the highly milled by-product foods.

The word vitimine is preferred to the phrase, "accessory food substance or food factor" for vitamines are necessary to life and there is no reason why we should argue against the use of the term vitamine or against the vitamine theory simply because no one has seen these substances? We do not know what electricity is other than an invisible agent.

Chemists have never isolated these substances so that their chemical composition might be known. They are known, however, by the effect which their absence in the diet produces on the animal organism and by the effects of adding them to diets that are deficient in vitamines. Perhaps someone in the near future will be able to isolate them in a pure state and determine their chemical makeup. Meanwhile it is advisable that the poultrymen pay more attention to the poultry ration based somewhat on our present knowledge of the vitamines.—J. C. Philo.

PRODUCE INFERTILE EGGS

UNITED States government experts recently conducted an experiment in Kansas to compare the loss from fertile and infertile eggs.

10,000 eggs, collected from different farms, were used in the experiment. Half were fertile and half infertile, and every egg was absolute fresh when it entered the experiment. These eggs were kept stored in parlors, some in kitchens, some in cellars, and some in pantries. Some were put in nests, some under laying hens, and some under setting hens. The same number of fertile and infertile eggs were always put under exactly the same conditions. In a week the eggs were collected and sold to the local grocery store where they were candled. They were then shipped to St. Louis where they were again candled.

While on the farm 29 per cent of the fertile eggs were spoiled for food, as compared with only 16 per cent of the infertile ones. On the way to market 14 per cent of the fertile ones were spoiled as compared with 9 per cent of the infertile. This makes a total of 43 percent of the fertile eggs unfit for food as compared with only 25 per cent of the infertile ones—a difference of 19 per cent. Notice that the greatest loss in both fertile and infertile eggs is on the farm.

In nature the purpose of the egg is to hatch a chick. Every fertile egg contains the germ from which a chick may develop. Incubation will start in a fertile egg whenever the temperature is more than 7 degrees. The germ from which the chick develops will grow just as well in a hot poultry house or in a cupboard by the kitchen range as it will under a hen. If the temperature falls below 70 degrees or runs higher than 109 degrees, incubation is checked.

Eggs come to market in all stages of incubation. The dealers call eggs which have started to incubate "blood rings," because they show a cluster of blood vessels when placed before the candle.

If an egg which has started to incubate cools, the germ dies. Such an egg, if kept in unfavorable conditions, completely decays, making the "black rot"—the kind of rotton egg which smells so disagreeable because of the hydrogen sulphide gas

BABY CHICKS *The most Progressive Hatchery in the country*

A NEW DISCOVERY BANISHES LICE

Simply Hang Can of Wonderful Liquid in Hen House and Lice Vanish

Any poultry raiser can easily and quickly double his profits by ridding his hen house of lice through the remarkable discovery of H. C. Haist, a Kansas City chemist.

Working along original lines Mr. Haist discovered that certain odors are highly offensive to lice and that they will not live where such odors exist. This enabled him to perfect his formula which is guaranteed to rid any hen house of these blood sucking and profit stealing pests.

This wonderful formula which is known as Lice Doom is easily used by simply uncorking a can and hanging at any convenient place in the hen house. Immediately a powerful gas is given off which, altho harmless to poultry, routs the lice as though by magic. In fact it is guaranteed that lice will not stay in any hen house where a can of Lice Doom is hung up to evaporate. Once rid from pestering lice and mites your flock will take on new life. The hens will lay more and the broilers will get fatter. In fact you can almost see your profits grow.

So confident is Mr. Haist that Lice Doom will rid any hen house of lice that he offers to send two large $1 cans to any reader who will write for them for only $1; and with the understanding that they cost nothing if not entirely satisfactory.

Send no money—just your name—a card will do, to H. C. Haist, 2017 Coca Cola Bldg., Kansas City, Mo., and the two large $1 cans will be mailed immediately. When they arrive pay the postman only $1 and postage. Use Lice Doom 10 days. If your hen house is not free from lice, or for any reason you are not satisfied, simply return the unused part and your money will be refunded. A large Kansas City bank says Mr. Haist does as he agrees, and ample bank deposits guarantee the refund of your money if you are not satisfied. Write today before the offer to send two $1 cans for only $1 is withdrawn, as this will enable you to sell a can to a friend and get your own free.

Better than Whitewash

CARBOLA
The Disinfecting White Paint

It takes less than five minutes to mix the Carbola powder with water and have it ready to use as a white paint and powerful disinfectant. *No waiting or straining; no clogging of sprayer.* Does not spoil. Does not peel or flake. Disinfectant is right in the paint powder—one operation instead of two. Gives better results, costs less. Used for years by leading farms.

Your hardware, paint, seed or drug dealer has Carbola, or can get it. If not, order direct. Satisfaction, or money back. 10 lbs. (10 gals.) $1.25 and postage; 20 lbs. (20 gals.) $2.50 delivered; 50 lbs. (50 gals.) $5.00 delivered; 200 lbs. (200 gals.) $18.00 delivered; trial package and booklet 30c.

KEEP THE BUSINESS FARMER COMING
SEE PAGE 25

which develops in it. Eliminate the fertile egg and the black rot, the most common and worst kind of rotten egg, will be eliminated.

If we want to use eggs for food, especially in hot weather, we must defeat nature's purpose by producing fertile eggs. Fertile eggs cause trouble only during the hot weather. You can prevent the great annual loss caused by them, if you will dispose of your roosters as soon as the breeding season is over. Experiments show that hens lay just as well, if not better, when there is no male in the flock.

This is such an important subject that the government has issued and distributed thousands of posters explaining how fertile eggs spoil, and urging farmers to dispose of their roosters immediately after the breeding season.

In Missouri, June 1st is set aside as "Swat the Rooster" day, other states are active along the same line.

RADIO DEPARTMENT

EDITED BY J. HERBERT FERRIS

BURN OUT BULBS

We have a complete Radio outfit we purchased as a receiving outfit. It does very satisfactory, it will receive from the middle western states to the gulf of Mexico. We have used it two evenings and burned out two tubes.—F. A., Plainwell, Mich.

—We think that you are burning your bulbs too bright, turn the rheostats down to the lowest point and then gradually light your bulbs until you are just able to hear the music. Your bulks will last for several hundred hours if they are not burned too brightly.

You also may be using too high voltage for your "A" battery, 6 volts is all that should be used for lighting your filaments, never use more than a 6 volt storage battery or 4 dry cells.

The music does not always come in as loud with your bulbs not so bright you get much longer service from them. I am using bulbs that have been used for over 2,000 hours each and they are as good as new.

BROADCAST BILL'S RADIOLAYS

DURIN' ev'nin's, 'fore its' time to go to bed, how I like 'o sit and listen, rubber ear-muffs on my head, to the singin' and the speakin' comin' in my radio; weather don't make any difference—let 'er rain, er hail, er snow. While I'm list'nin' there so peaceful to the music from the air, I kin also get enjoyment in a game of solitaire. I like most a game of canfield, there are others I kin play, but I never knew it had a name until the other day, when a drummer down at Perkin's store explained how it wuz done in those classy gamblin' joints where they don't play jest for fun. You hand out yer fifty dollers, or I guess it's fifty-two, then a gent gives you a deck of cards an' after you are through fer each card up in the ace now he will hand you back five beans—Gosh! I like the game much better, now I've found out what it means. So when wifey goes out callin', leavin' me at home alone I get out a deck of cards an' play there by my radi'phone. It combines my fav'rite pastime, an' the time goes by so fast that the clock soon ticks nine-thirty, an' I know my bedtime' past. So I play another hand er two while waitin' fer the time that they broadcast out from Arlington before I start my climb. Sweet Minerva, that's my better half, religiously inclined, hasn't took so very to my habits so I find just because on Sunday ev'nin' when she went in town to church, I said I'd stay at home an' listen—kinda left her in the lerch. That wuz not the only reason, fer while workin' Saturday I had sprained my back most awful loadin' up some bales of hay. So she went to church with Willie—I stayed home to listen in an' I reckon she'd fergive'd me is it only hadn't been. I'd fergot that it wuz Sunday an' wuz playin' solitaire as I listened to the choir, an' the sermon from the air. Min came home an' caught me playin'—I kin tell the Universe when it comes to home made sermons Sweet Minerva ain't so worse. Now I'll sit these cool evenin's 'fore its time to go to bed, an' do nothin' else but listen since Minerva's say is said. Copyright, 1922, Westinghouse Electric and Manufacturing Company.

CHICKS—WE HAVE SHIPPED THOUSANDS each season since 1904. Different breeds, free booklet with guarantee and delivered price. Freeport Hatchery, Box 10, Freeport, Mich.

MARKETING EGGS IN THE SUMMER

THE egg problem in the summer is of importance to everybody having poultry. It is in summer that there is little demand for hatching eggs, a reduced market, and increased production, and temperatures unfavorable to long keeping. The successful meeting of these conditions depends somewhat on the location of the person having the poultry, the size of the flock and the number of eggs.

In order to outdistance the heavy competitive field at this difficult season of the year, it is necessary that the eggs be delivered absolutely fresh. It is often more satisfactory for the eggs to be delivered direct to the housewife rather than to the retailer. A house-to-house canvas for customers in the nearby town, supplemented by advertising, and capped off by a guarantee of the freshness of the eggs. To insure the success of this system, it is essential that not one customer shall ever find one bad egg among those delivered. One bad egg will often lose a customer permanently; no number of good eggs can ever compensate for it. If the eggs are always fine, fresh, and cool when delivered, it will, of course, be unnecessary to replace any eggs under the guarantee, and premium prices will be commanded—prices sometimes almost twice as high as those that the retailer would have paid for the "yard eggs," if dedelivered to him.

If the eggs are to be "fine" and "fresh" they must be gathered often. They must be kept in a cool place from the time they are carried to the house until they are delivered to the customer. They must not be permitted to become warm on the way to town. Of course, it goes without saying that the eggs must be infertile; that is, the males must be kept segregated from the females throughout the summer season and, in fact, at all times except during the breeding period.

The eggs, by all means, should be clean. This implies that they shall be laid in nests made of clean, fresh straw or other suitable material. The hen house and yard should be kept as clean as possible, and free from mud. The eggs themselves should never be washed but a damp cloth may be used to remove occasional spots on an otherwise clean and attractive egg. Dirty eggs always look stale, even though they are not, and they are repulsive to the eyes of the housewife.

Summer is a good time for the family to eat all the eggs it likes, for prices in town are not so good as at other seasons. Right at home is often one of the best markets that can be found. Eggs may be made into appetizing early-morning egg-and-milk drinks that are just the thing to start a hard working day. They are fine in all sorts of cooking, as the kitchen chairman knows, being ideal for cakes, cookies, deserts and all sorts of good things that are especially popular in summer.

If the flock is large and production is high, it is often advisable to use the water-glass route for marketing. The United States Department of Agriculture has full information in printed form in regard to the water-glass method of preservation, or the county home demonstration agent can furnish the right advice. Water-glassing will permit the poultryman-farmer to make high-priced winter eggs of low-priced summer eggs. This method, properly employed, offers no serious objection. It has repeatedly been demonstrated with thousands of eggs that the eggs so preserved are equal to any other kind of eggs for cooking purposes. They may be sold as water-glassed eggs to retailers at prices slightly lower than those paid for fresh "yard" eggs, or they may be used by the family at a time when the production is reduced.

Marketing eggs in summertime is a problem that may be solved with the assistance of a little forethought.

A young lawyer wrote a prominent practitioner in Dallas, Texas, asking what chance there was for a man of his stamp in that section. He said,

"I am a Republican in politics, and I am an honest man."

The Texan wrote back,

"If you are an honest lawyer, you will have no competition here, and as you are a Republican, the game laws will protect you."—Everybody's Magazine.

The Agricultural and Business Situation

Revised Monthly by the Department of Research of the American Farm Bureau Federation.

The growth of industrial prosperity as indicated by such barometers as iron output and the stock market is proceeding rapidly. Insofar as this continues, it will mean strong domestic demand for the products of agriculture. The past month's developments, however, are adverse to immediate agricultural prosperity, which awaits more favorable price relationships. Price readjustments appear likely to be slow in coming. In the last month farm products at wholesale have declined relative to other commodities.

I. PRODUCTION AND TRADE.

The high rate of industrial production is reflected in the iron and steel trade which is now operating at 90% of capacity and is producing at the rate of about 45 million tons per year, which is approximately the same as at the peak of production in 1920.

The official report of the Bureau of the Census on cotton ginnings, places the 1922 crop at 9,761,817 equivalent 500 pound bales, which is a reduction of 200,000 bales from the December estimate of the Department of Agriculture. The unofficial forecast of the cotton acreage by the Brookmire Economic Service places the probable acreage for 1923 at 35,250,000 acres, or an increase of 4.4% over 1922 plantings.

II. FOREIGN TRADE.

The latest available figures indicate some shifts in foreign trade. Pork and lard exports for the first seven months of the current fiscal year are close to the figures for the same period in the fiscal year 1922. Vegetable oils are running about the same; cotton shows a 10% decrease. Cereals, however, have fallen off largely; corn from 91 million bushels to 66 million; wheat from 167 to 121 million bushels. Part of the decrease in corn exports may be accounted for by 40 million bushels of rye exported since July 1. Rye being only ten cents above corn in price is at an unusually attractive figure for buyers. The decline in our wheat exports has apparently been made good on the part of European consumers by purchases elsewhere, especially in Canada. This is made clear by a comparison of world shipments which, in the period from August 1, 1922, to March 1, 1923, totalled 414 million bushels against 401 million a year ago, and 332 million two years ago.

On the import side it is to be noted that the United States is swinging back into its normal position as a heavy importer of cheese, 40 million pounds having been imported in the eleven months ending November, 1922. Imports of vegetable oils and oil bearing materials have increased as a result of the industrial revival. Imports of sugar for the eleven months period of 1922 are nearly twice as large as in 1921 as a result of the rapidly growing demand in this country.

In foreign exchange, the most important feature is the continued strength of sterling which stands now at about $4.70 or 96.5 per cent of par. Continental exchanges continue weak and rather erratic although French and French Belgium francs are somewhat higher than a month ago. Marks are still holding around the 20,000 to the dollar mark.

III. MONEY AND CREDIT.

Financial statistics indicating the volume of trade, such as bank clearings, are low in February on account of the shortness of the month. A significant feature of recent months is the increased exports and smaller imports of gold, net imports for the seven months ending January, 1923, being 150 million dollars against 354 million for the same period last year. The trend of the stock market has continued strongly upward, whereas advancing interest rates are reflected in a slight decrease in bond prices.

IV. PRICES.

Wholesale price changes in February were slightly unfavorable to agriculture, the all commodity index rising one point while farm products lost a point. During the past month twelve out of the twenty-four products quoted in the table below increased in price, ten decreased, and two remained unchanged. The most important changes were increases in the price of cotton, potatoes and poultry; and declines in egg, butter and hide prices.

Recovery from the depths of depression a year to a year and a half ago has been much slower in raw farm products than in industrial raw materials. Industrial materials such as pig iron, copper and rubber have regained 30 to 40 per cent of the decline from their extreme high points before the crisis while corn, wheat and livestock have regained but 10 to 20 per cent of this loss. Cotton has shown a rapid recovery having regained close to two-thirds of its extreme decline.

Wool	211	211	108

4. Relative Purchasing Power of Farm Products:

(U. S. Bureau of Agricultural Economics)

The quantity of various commodities which a given amount of each farm product would purchase at prices prevailing in 1913 is put equal to 100. The figures given represent the percentage of this quantity which the same amount of farm products would purchase in January, 1923. Prices at the farm are used for agricultural products, and wholesale prices at central markets for other commodities.

	All Commodities	Cloths, etc.	Fuel, etc.	Metals, etc.	Building Mtls.	House Furn'gs
Cotton	134	107	96	157	111	114

MARKET FLASHES

MARKET SUMMARY

Wheat quiet. Corn and oats unchanged. Demand for rye off. Beans steady. Potatoes firm. Butter easy but eggs in demand with prices firm. Poultry quiet and steady. Dressed calves in demand. Cattle active and prices steady. Sheep dull and lower in price. Hogs in demand and prices higher. Provisions average Higher.

(Note: The above summarized information was received **AFTER** the balance of the market page was set in type. It contains last minute information up to within one-half hour of going to press —Editor.)

FOOTE'S MARKET LETTER

By W. W. Foote

WHILE there is still much complaint regarding rising prices for most commodities and the consequent higher cost of living than a year ago, the times are somewhat better for farmers, especially for those out of debt, and the Michigan farmers as a class have not seen their lands shrink as much as the farmers of other states of the middle west. Conditions in the grain trade are mostly satisfactory for farmers, and despite much bearish talk indulged in by speculators on the Chicago Board of Trade and other leading markets, wheat has undergone a fair upward movement, May wheat having sold within a short time as high as $1.21⅝, comparing with $1.30¼ a year ago. Corn, too, shows a firm undertone, with no burdensome stocks in sight and unusually large consumption on the farms of the corn belt states. "Cash corn is selling around 75 cents per bushel for the No. 3 grade in Chicago," says a prominent grain trader, in discussing the situation. "Hogs on the farms are not selling far below $8 per 100 pounds, or equal to 80 cents a bushel for corn in the country. It will be seen that the position of shorts in May corn is very uncomfortable," Turning from grain to live stock, it cannot be denied that the recent course of cattle and hog markets has been such as to give encouragement to stockmen, prices having advanced at a time when the pessimists were predicting declines. Casting speculative opinions aside, it must be said that since the close of Lent consumption of beef has shown marked improvement, while the consumption of fresh and cured hog products has been extremely large for many weeks. Lambs are the greatest money-makers of all kinds of live stock, as every sheepman fully realizes, and especially liberal profits are made by the fortunate ones who have any early spring lambs to sell. Most of the lambs now being marketed were born a year ago, however, and they are selling for higher than before the war. Michigan farmers are particularly interested in the market for pea beans, and it may be said on authority of the Bean and Pea Journal that there are probably not over one hundred cars of pea beans left in the state of New York, most of the remaining holdings being held in Michigan. That journal says: "Practically all of the pea beans in the United States are grown in Michigan and New York. Of course, there are some unimportant quantities grown in Minnesota, Wisconsin, and some northern states, but there are none worthy of mention, grown in the latitudes south of these states, and this is because the climatic conditions are not favorable for them. The feature of the Michigan market which is most surprising to the Michigan jobbers, who realize that 40 percent of the Michigan crop is consumed by the canning trade, is where are the canners getting their beans.

The Grain Trade

Wheat continues to sell at lower prices than were paid a year ago, but the difference is less than it was early this year, and the undertone is much stronger. Recently the export demand for durum and hard winter wheat has shown marked improvement, and the visible supply of wheat in the United States is decreasing, although it stands at 45,785,000 bushels, or about 10,000,000 bushels over a year ago. Corn is in a firm position, and both corn and oats continue to sell much higher than a year ago, while rye is selling very much lower than at that time, the visible rye supply being up to 18,268,000 bushels, comparing with 9,495,000 bushels at this time last year. The visible corn supply is down to 28,742,000 bushels, comparing with 46, 889,000 bushels a year ago; while that of oats is only 24,044,000 bushels, comparing with 64,644,000 bushels last year. Huge amounts of corn and oats have been fed to live stock, and within a short time Indiana stockmen have bought corn in Chicago costing around 78 cents a bushel laid down in northern Indiana. Reports come from the northwest that the bankers are advising farmers to curtail their acreage devoted to wheat and other grains. Late sales were made of May wheat at $1.23, comparing with $1.30¾ a year ago; May corn at 77 cents, comparing with 58⅝ cents last year; May oats at 45¾ cents, comparing with 36¾ cents last year; and May rye at 83½ cents, comparing with $1.01½ a year ago.

The Live Stock Problem

How to produce cattle, hogs and sheep for the market profitably is one of the problems farmers must meet in these times of changing conditions. Just now the approach of the grazing season forces them to look the ground over and figure what kind of feeder cattle to buy and how much to pay, for a small difference in the cost per 100 pounds in buying a steer may go far to offset the cost of putting on fat. As is the case every spring, the market for stockers and feeders has been advancing steadily for weeks, and there are few bargains to be picked up in the Chicago stock yards. It is true, thin cattle can still be purchased at low prices, but offerings with good quality to recommend them are selling much above the prices paid a month ago. Different stockmen have varying opinions about what stock to buy and what to feed them with, and some men are successful in fattening high-priced thin cattle, but the average stock feeder buys good stock cattle, while avoiding the highest priced lots. Stockers and feeders sell in the Chicago market at $5.25 to $8.50, mainly at $6.75 to $7.85, no good lots selling below $7.

The Cattle Outlook

Farmers who have not yet arranged to stock their pastures with cattle for summer grazing are deliberating what course to follow, while those owning matured beef cattle are losing no time in getting them shipped to market. Cattle are being marketed much more freely than a year ago, but recent marked improvment in the demand in the Chicago market has enabled sellers to obtain higher prices, especially for the choicer class of weighty steers, as well as for strictly yearling steers and heifers. The commoner cattle are less active than the better offerings, but even ordinary steers are much higher than they were several weeks ago. More cattle are reported in feeding districts than a year ago, but the demand is larger, and fat yearling heifers are especially active and firm. Beef steers sell on the Chicago market at $6.90 to $10.40, mainly at $8.25 to $9.90. A year ago $9.35 paid for best.

Recent Advance in Hogs

During the latter part of March there was a rush to get Illinois fed swine on the market, as tax assesments in that states are made on the first of April. Early April receipts of hogs in Chicago have undergone a great falling off, and much of the restricted marketings are attributed to bad country roads. Prices have had some good advances, with a lively local demand and fair purchases of eastern shippers, prime light bacon hogs selling highest, although at a reduced premium. Hogs offered of late graded well and averaged 240 pounds. Of course, the large exports of lard and cured hog meats tend to strengthen hog values, weekly shipments to foreign consumers running far ahead of a year ago. The large marketing of hogs may be judged from the fact that western packing for the season to recent date amounts to 4,306,000 hogs, comparing with 2,623,000 for the same period a year ago. Stocks of cured hog meats in packing points are much larger than a year ago, but lard holdings are down to 27, 201,000 pounds comparing with 44,675,000 pounds a year earlier. Hogs look like good property, and they should be made good, but not heavy. Recent sales of hogs were made at $7.25 to $8.75.

High Prices for Lambs

Extremely high prices are paid in the Chicago market for choice flocks of lambs of not too heavy weight, as well as for light yearlings, fat wethers an dewes, although recent sharp declines have taken place in prices for choice lambs. Exporters are fair buyers of fat heavy clipped lambs, and in the course of a week 2,000 head averaging 107 pounds brought $10 per 100 pounds. Colorado has been furnishing the greater part of the lambs born a year ago, while California is supplying numerous consignments of lambs born last November. Wool lambs sell at $12.25 to $14.75.

WHEAT

The past fortnight was a healthy period for wheat and prices are somewhat higher than they were at the beginning of this period. The market opened weak but closed firm for the first week opening easy again the last week but firming up later and gains in prices were made, an increase in the export demand caused the upward turn to the market. While the takings were nearly all Canadian wheat purchases of American durum were larger than usual and some other varieties were in moderate demand. The total was large enough to alarm the bears and those who had been short were in a hurry to get out, while some heavy dealers in the east who had sold out their holdings of wheat got busy reinstating their lines. The market has had a great deal of eastern support all along. There appears to be a general willingness to see higher prices and bulls are quick to return to the buying side of the deal every time they see an opportunity. The feeling is again general that Europe will take a lot of wheat in the near future. The market has plenty of bearish news, but there is a tendency to ignore the big stocks and all other things that look like causing weakness.

Crop damage was not specially bad. The western part of Kansas appears to be the worst spot on the map and there is lack of moisture in Nebraska also. Some rains have been falling on the other dry places, but there is yet time for plenty of alarm over the new winter wheat crop and observers sap the growing weather will develop a very unfavorable condition over a great deal of the southwest.

Prices

Detroit—Cash No. 2 red, $136½; No. 2 white, $1.36½; No. 2 mixed, $1.36½.

Chicago—Cash No. 2 hard, $1.23½@1.24; No. 1 northern, $1.24½.

New York—Cash No. 2 red, $1.50; No. 2 hard, 1.35½; No. 2 mixed, $1.29.

Prices one year ago—Detroit, No. 2 red, $1.40; No. 2 white, $1.37; No. 2 mixed, $1.37.

CORN

Corn has shown a great deal of strength and is in a firm position all over the country. Prices at Detroit gained 4c last week and 1c the previous week. Local demand has been only moderate. Canadian exporters were active in the market but found the grain hard to get. Sales of 300,000 bushels of contract corn were reported to go to store. Country offerings were practically nil despite strong bids sent out. Experts agree that this grain is in a position favorable to higher prices.

Prices

Detroit—Cash No. 2 yellow, 85½c; No. 3, 83½c; No. 4, 81½c; No. 5, 79½c.

Chicago—Cash No. 2 mixed, 79½c; No. 2 yellow, 79¾@80½c.

New York—No. 2 yellow and No. white, 99½c; No 2 mixed, 99c.

Prices one year ago—Detroit, No. 2 yellow, 64c; No. 3, 62½c; No. 4, 61c

---

OATS

The backward spring is giving the oat market a bullish outlook and large consumers of this grain are beginning to wear a worried look. They have good reason to, because farm work is far behind and seeding is going to be unusually late which indicates higher prices.

Prices

Detroit — Cash No. 2 white, 51½c; No. 3, 50c; No. 4, 48½c.

Chicago—Cach No. 2 white, 46¾@47½c; No. 3, 45½@46½c.

New York—Cash No. 2 white, 56½@57c.

Prices one year ago—Detroit, No. 2 white, 42c; No. 3, 40c; No. 4, 38c.

RYE

Rye made a small gain in price at Detroit during the past fortnight following the trend of other grains but there is not much demand and the market is quiet. Indications are that rye will follow the other grains upward.

Prices

Detroit—Cash No. 2, 81½c.

Chicago—Cash No. 2, 84¾c.

Prices one year ago—Detroit, Cash No. 2, $1@1.01½.

BEANS

The bean market looks like a big question mark to producer, dealer and student of the market. At Detroit and several other points a dull tone prevails with prices quiet after recent declines, while at New York and on many other markets there is sufficient demand to take all offerings at steady prices. Demand on the New York market is such that dealers believe that state will go into the new crop season with empty bins. Reports from California indicate the market in that state is in a fairly healthy condition with no immediate prospects of much lower prices.

Prices

Detroit—C. H. P., $7.15 per cwt.

Chicago—C. H. P., $7.65 per cwt

Prices one year ago—Detroit, C. H. P., $6.90 per cwt.

POTATOES

Many markets report receipts far greater than demand but the Detroit market has only a small supply and prices on this market are firm. The shortage at Detroit is due in part to the fact that some Michigan spuds are eastward to New York city and other markets in that section.

Prices

Detroit—Michigan, $1.41 @ 1.50 per cwt.

Chicago—Wisconsin sacked round whites, $1@1.05 per cwt; Minnesota sacked red river Ohios, $1.15@1.25 per cwt.

Prices one year ago—Detroit, Michigan, $2.10 per cwt.

HAY

The movement of hay to market during the last three months has been about normal, with some exceptions, a survey just completed by the United States Department of Agriculture indicates. About 65 per cent of the marketable surplus of timothy was reported marketed up to March 15. Although this was about 10 per cent less than the percentage marketed to March 15 last year, a larger volume of timothy has been marketed this season than during the corresponding period last

New Way to Rid Poultry of Lice

Rev. G. R. Mente Tells of Amazing Discoverv Which Keeps Hens and Chicks Free From Vermin

Few Drops of Liquid in Drinking Water Does it—No More Dusting, Spraying or Greasing

"I have used your remarkable Lice and Mite Remedy with fine results," writes Rev. G. R. Mente, Methodist Parsonage, New Washington, Ohio. "Mentioned this at a Farmer's Institute a few weeks ago. Consequently, farmers by the dozen have been after me every since to find out where and how they could get it. It has put a stop to the poultry losses in this community. You are a great benefactor to poultry raisers."

Lice and Mites Go Like Magic

No Wonder She Doesn't Lay or Set

This remarkable new discovery which Rev. G. R. Mente, used is Imperial Lice and Mite Remedy. Just a few drops occasionally in the fowls drinking water makes Lice, Mites, Ticks and all vermin go like magic. No more disagreeable and unsanitary dusting, spraying, greasing or dipping. Equally good for Chickens, Turkeys, Ducks, Geese and Pigeons Fine for baby chicks and makes them healthier, sturdier and grow faster. All poultry raisers know that sickly, lice-infected hens cannot lay or have good hatches. Vermin sap the very life and strength of hens and baby chicks. Stop these losses now. Guaranteed not to affect eggs or flesh of fowls in any way. Also a spleidid egg tonic and blood purifier. Costs but a trifle, on money-back guarantee of satisfaction.

White Diarrhea Remedy Free (Regular $1.00 Size Package)

At last a sure treatment for this dread disease. No muss. No fuss. Comes in condensed tablet form to be dropped occasionally in chicks' drinking water. Raise every chick hatched. Economical to use. Be prepared. These remedies should always be on hand.

SEND NO MONEY. Just your name and address to Imperial Laboratories, Dept. 6399, Kansas City, Mo., for one regular, full size $1.00 bottle of Imperial Lice and Mite Remedy (double strength), and they will include free of cost, a regular $1.00 box of Imperial White Diarrhea Remedy. Pay postman only $1.00 and few cents postage on arrival. Or, a large size Trial Package of either one of these remedies for 50c.

If you have a large flock, this Special Introductory Offer also applies on a double quantity of both remedies—two regular $1.00 bottles of Lice and Mite Remedy, and two regular $1.00 packages of White Diarrhea Remedy at an additional saving—all for $1.75. Simply specify that you be sent this regular $4.00 value for only $1.75. Readers risk no money, as Imperial Laboratories are fully responsible and will refund the cost on request any time within 30 days.

BREEDERS' DIRECTORY
(Continued from Page 23)

HAMPSHIRES

HAMPSHIRES—SPRING BOARS AND BRED gilts from 25 sows to select from. Place your order now or you may be to late. 10th year. **JOHN W. SNYDER, R. 4, St. Johns, Mich.**

REGISTERED HAMPSHIRES, BRED SOWS and Gilts, fall pigs both sex. Leading blood lines. Priced to sell. Inspection invited.
CLARENCE L. CAMPBELL, Parma, Michigan

HORSES

FOR SALE: OUR ENTIRE STABLE EQUIPMENT. Six horses, harness, wagons, feed grinder, etc, etc. We are motorizing all our routes and have no further need for horses. Look our stable over and make us an offer for anything you may need. **FEDERAL LAUNDRY COMPANY, Third and Elizabeth Sts., Detroit.**

SHEEP

ALL SOLD OUT FOR THIS WINTER. BOOKING orders for next August.
DAN BOOHER, Evart, Michigan.

WANTED TO BUY 100 BREEDING EWES. Write description, price and ages.

HIGHEST PRICES PAID FOR LIVE AND Dressed Poultry, Veal, Eggs. A square deal always.
C. E. McNEILL & CO.,
825 W. So. Water St., Chicago, Ill.

year, and a larger volume yet remains to be marketed, the survey shows. Movement from Michigan, New York, and Wisconsin has been especially light, where approximately 50 per cent of hay remains to be marketed.

Bad roads and a scarcity of cars are reported to have retarded the movement of hay in the central west while severe winter weather has held up shipments in New York and New England. Movement in the southwest has been larger under mild weather conditions.

General demand for all kinds of hay is reported as having been about normal, but large local supplies in the south have cut down somewhat the demand for timothy from central western markets. High freight rates have restricted marketing in the far western states.

Timothy prices at the principal markets are about $1.50 per ton lower on an average than at the corresponding time last year, but have advanced about $2 per ton during the present crop year. Alfalfa prices have advanced about $2.50 per ton during the marketing season but are on practically the same level as April 1, 1922.

Stocks of hay in consuming channels are about normal and there is small prospect of any material increase in the demand, the department says.

Prices

Detroit—No. 1 timothy, $16@-16.50; standard, $15.50@16; light mixed, $15.50@16; No. 2, timothy, $14@15; No. 1 clover mixed, $13-@14; No. 1 clover, $13@14.

Chicago—No. 1 timothy, $21@-22; No. 2 timothy $18@20; No. 1 llight cllover mixed, $19@21; No. 1 clover, $15@16; No. 2, $13@14.

PRITCHARD'S WEATHER FORECAST
INTERPRETED BY THE STARS

Week of April 15

This week begins with strong winds and rains in Michigan. Temperatures will average about normal or a little above until about Tuesday.

During the middle days of the week we expect generally fair, sunshiny weather, good for most growing crops and the seeds already planted. Temperatures will not be very low.

At the end of the week weather will be warmer with an increase of wind.

Week of April 22

The very beginning of this week will be sunshiny in Michigan but during Monday or Tuesday rain will set in which will be heavy in sections of the state before Thursday. Winds will be of gale force.

Stormy conditions through the middle part of the week will hinder spring seeding but will benefit pasture land.

Temperatures will fall below the normal about the 25th and for the next two or three days the ground will average cold and wet. By the end of the week temperatures will be rapidly rising bringing assurances that next week will average warmer than usual.

Peas and Beans

Believing the average temperature will be below normal for the season, we would say that peas would have a pretty good year. Canada field peas should do well in Michigan this year by planting now but soys and cow peas will be better if planted a little later than usual—say about the end of May.

Planting time for beans this year will be backward, cold and wet on the average. Conditions will remain wet during June and part of July, but as the temperature is expected to average above normal for the three weeks centering on the solstice date, germination and growth, once started will be rapid. Late plantings will be successful.

Owners Say, Hupmobile Costs are Lowest

The most amazing thing about the Hupmobile has yet to be learned by the vast majority of motor car buyers and owners.

That is the fact that our owners' carefully kept cost-records, and their letters to us, strongly indicate that the Hupmobile cost of operation and maintenance is lowest among motor cars.

This is particularly true when the records cover a period of years.

What we are repeating here is the actual experience of Hupmobile fleet-owners, and of individual Hupmobile owners, who previously operated cars generally conceded to be among the most economical five manufactured,—and who have formed their judgments on the sound basis of cost-per-mile.

Hupp Motor Car Corporation, Detroit, Michigan

Ideal Park where E-J Workers and their families enjoy out-door sports

Our way of saving you money on Boys' and Girls' shoes

Because from the first, the best workers, the best material and the best workmanship were our standards, everybody wanted our shoes. The result is that now we have to make 32,500,000 pairs a year to supply the demand.

This quantity production has brought down manufacturing costs to us, prices to dealers and prices to you. *Quality stays up!* We keep it there. We take pride in our work and always try to make it better. People call us the "smiling shoemakers."

Why?—Our factories are fine, our homes attractive. We have libraries, playgrounds, medical attention without charge when we are sick. We share in the profits of our work. Isn't it natural our work should be better? We are sure you will think so with the first pair of E-J's you buy for your children.

332 of these machines cut soles for E-J shoes.

4 TIMES Around the World with ONE OILING

100,000 Miles Without Stopping for Oil

An inventor who could develop an automobile, a railroad car or any other conveyance on wheels which would perform such a feat would be considered a wonder. But such is the record of regular accomplishment by the Auto-oiled Aermotor during the past eight years in pumping water.

Did you ever stop to think how many revolutions the wheel of a windmill makes? If the wheel of an Aermotor should roll along the surface of the ground at the same speed that it makes when pumping water it would encircle the world in 90 days, or would go four times around in a year. It would travel on an average 275 miles per day or about 30 miles per hour for 9 hours each day. An automobile which keeps up that pace day after day needs a thorough oiling at least once a week. Isn't it marvelous, then, that a windmill has been made which will go 50 times as long as the best automobile with one oiling?

The **Auto-oiled Aermotor** after 8 full years of service in every part of the world has proven its ability to run and give the most reliable service with one oiling a year. The double gears, and all moving parts, are entirely enclosed and flooded with oil all the time. It gives more service with less attention than any other piece of machinery on the farm. To get everlasting wind-mill satisfaction buy the Auto-oiled Aermotor, the most efficient windmill that has ever been made.

For full information write **AERMOTOR CO.** Chicago Kansas City Dallas Minneapolis Des Moines Oakland

Current Agricultural News

FRIDAY PREDICTS PROSPEROUS YEAR FOR FARMER

CONSIDERABLE damage done to fruit and truck by freezing during month," a statement from the bureau of economics, U. S. Department of Agriculture, concerning the crop situation in the southern states, bears out the prediction of President David Friday, of M. A. C., that Michigan is due for an unprecedented period of agricultural prosperity.

"From a purely selfish standpoint," declared President Friday, "the recent frosts in the southern states have done more to guarantee good crop prices for Michigan producers than any other factor."

He stated that Michigan Agricultural College would not have to conduct an extensive research program in agricultural marketing for the next year, inasmuch as the farmers could find a ready market for their products at prices far exceeding those of any year since 1919.

"It will be a banner year for the growers," he affirmed, "and they can thank the frost for it, almost entirely."

BIG REDUCTION IN POTATO ACREAGE

A REPORT of special interest to commercial potato growers has just been made by the statisticians of the U. S. Bureau of Agricultural Economics in the leading potato states. By an exchange of this information, L, Whitney Watkins, Commissioner of Agriculture and Verne H. Church, Agricultural Statistician for Michigan, have been able to make a report on the intentions of potato growers with respect to their operations in 1923, in Michigan and competing potato states.

There is to be a decreased acreage in all principal potato states, but the market decrease will occur in the western states where acute car shortage prevented early moving of the crop, and where the low prevailing prices and high freight rates have made it unprofitable to market at all in many sections. Colorado expects to reduce its acreage 20 per cent; Idaho, 22 per cent; North Dakota, 25 per cent; and South Dakota, Nebraska and New Jersey, 15 per cent. These are the states that showed the greatest increases in acreage last year, and this report shows the general tendency to return to normal.

Minnesota's statistician estimates a ten per cent decrease, Wisconsin and New York will decrease their plantings to the extent of six per cent. Michigan eight per cent, Maine seven per cent and Virginia nine per cent.

The eastern states were able to clean up their last year's crop fairly well and if they can finance their fertilizer purchases satisfactorily will decrease their acreages only a few per cent. In the central states like Michgian, the increased acreage last year was principally in the counties bordering on the main commercial districts rather than on the farms of large growers. The discouraging prices at which many new growers sold will cause some drop out this year entirely or to reduce their acreage.

The reductions indicated will bring the acreage close to, or slightly below that of two years ago. With a normal yield, a crop sufficient for the needs of the country should be produced from that area. Such a crop would not leave a large surplus to force the price down below the cost of production, as was the case in 1922. With the tendency toward the increased use of certified seed and suitable commercial fertilizers, better average yields per acre should be obtained.

M. A. C. GETS SUGAR BEET TEST STATION

THE federal sugar beet experiment station formerly located at Blissfield, Michigan, has been transferred to East Lansing under a new cooperative arrangement whereby the U. S. Department of Agriculture and the college will work together in joint sugar beet investigation work, according to announcement made here this week.

Important developments in plant breeding and experimental work of value to the sugar beet industry of the state will be undertaken by the new station. Prof. F. A. Spragg, famous plant breeder with the M. A. C. crops department, and his assistant, E. E. Down, will cooperate with the federal workers in extensive projects and cultural investigations.

Michigan ranks third among the states of the country in sugar beet production, and an effort will be made by the college crops department, to whom the Blissfield equipment has already been turned over, to develop the strongest possible sugar beet work in the state.

PLANT LESS WHEAT THAN LAST YEAR

A SPECIAL inquiry was made this year in 11 states relative to what farmers intended to plant. This was in the nature of an experiment to determine whether such an inquiry would be for practical use each year in appraising farmers of the situation in other sections of the country. The results exceeded expectations and the U. S. Bureau of Agricultural Economics believes the information will be helpful to farmers in planning their season's work. The following report was issued by L. Whitney Watkins, State Commissioner of Agriculture, and Verne H. Church, U. S. Agricultural Statistician, on the subject.

For the United States, the acreage of the principal crops intended to be planted, in percentage of last year's acreage grown for harvest is as follows: spring wheat, 94.5; corn, 102.6; oats, 102.6; barley, 105.7; flax, 189; potatoes, 90.9.

In Michigan, the tendency is for an increase of principal crops except spring wheat and potatoes. The spring wheat acreage is a small factor and has decreased materially in late years, but a further decrease of 22 per cent is indicated by the repors. The decrease in potatoes is reported as eight per cent, or slightly more than the increased plantings made last year, An increase of one per cent in corn, seven per cent in oats and 22 per cent in barley is reported, but the backward spring and shortage of labor will probably prevent much of this intended increase. There is much interest in beans, and reporters estimated an increase of 17 per cent over the large acreage of last year. The marked increase in the price offered for sugar beets has stimulated interest in that crop and a gain of 56 per cent over last year is anticipated, last season's acreage being far below normal.

M. A. C. TO HOLD FIRST HORSE SHOW

"DYNAMITING people out of cars onto horses," will be the slogan of the first annual horse show, to be held at East Lansing, May 30. The memorial day fete, the first ever planned here is sponsored by the Reserve Officers' training corps of the Michigan Agriculural college.

Captain William C. Chase, cavalry officer in the regular army, is directly in charge of all arrangements. He is assisted by the other cavalry officers detailed to the M. A. C. military detachment of R. O. T. C.

Many classes of events are being arranged: The charger class, open to all comers; cadet jumping, an exhibition of riding and jumping to be staged by the military cadets of the college; open jump; the ladies' mount, and the horsemanship class, for cadets only. It is expected the 117th field artillery, of Lansing, will enter one gun from each battery in the exhibition riding.

Cavalry exhibitions will be staged throughout the afternoon, and bands will give a continuous concert.

Cups and ribbons are to be awarded for the evarious events. The cups will be donated by individuals in Lansing, the M. A. C. Officers' club and the college military unit.

Dealing with birds and their habits, an English naturalist says that among common British birds the one which built the most wonderful and the most beautiful nest was the long tailed tit, which used nine hundred feathers to line its nest.

What the Present Legislature Has Accomplished

Of the Many Bills Proposed of Interest to Michigan Agriculture, Some Have Passed, Some Have Been Vetoed and Some are Marking Time Awaiting Support from Home

By STANLEY M. POWELL

ELEVATOR EXCHANGE BACKS CASE BILL

SENATE BILL No. 308 introduced by Senator Bernie L. Case, ordered printed, and referred to the Committee on Agriculture. To prevent unlawful discrimination in the purchase of potatoes and to provide punishment for the same.

> The People of the State of Michigan enact. Any person, firm, co-partnership, corporation or association engaged in the business of buying potatoes for the purpose of resale, who shall, with the intention of creating a monopoly or destroying the business of a competitor, discriminate between different sections, localities, communities or cities of this State, by purchasing such potatoes at a higher rate or price in one locality than is paid for potatoes of like grade and quality by said person, firm, co-partnership or corporation in any other locality, after making due allowance for the difference, if any, in the actual cost of transportation, shall be deemed guilty of unfair discrimination and upon conviction thereof shall be punished by a fine not to exceed five hundred dollars or by imprisonment in the county jail not to exceed six months.

WHEREAS, the farmers' co-operative marketing movement is of the utmost importance to the greatest number of the people in Michigan including both farmers and consumers, and

WHEREAS, unjust discrimination on the part of competitors purchasing agricultural products at several different points in the state constitutes one of the most serious handicaps to the farmers' co-operative marketing movement.

BE IT RESOLVED, that the board of directors of the Michigan Elevator Exchange, representing one hundred and seven local co-operative elevators and associations serving 2,500 farmers, hereby requests the members of the legislature to give the Senate Bill No. 308 introduced by Bernie L. Case, their support.

BE IT FURTHER RESOLVED, that the agricultural committees of both houses be requested to report the bill out as promptly as possible.

The secretary of the Michigan Elevator Exchange is hereby instructed to forward copies of this resolution to the members of of the said commitees. Signed: W. E. Phillips, Decatur; Carl Martin, Coldwater; M. Shisler, Caledonia; Jas. Eardley, Rockford; Geo. McCalla, Ypsilanti; John Nicholson, Marlette; H. D. Horton, Kinde, Board of Directors, Michigan Elevator Exchange, at regular meeting April 18, 1923.

WHILE the present session of the Michigan State Legislature is being accused by the press and public of enacting the least constructive legislature of any session in history, it is refreshing to review its accomplishments and to note the friendly attitude shown toward Michigan agriculture. Perhaps this is due to the fact that many of the Senators and Representatives are farmers themselves, perhaps it is due to the fact that Michigan farmers are today better organized than ever before and their organizations are co-operating in a splendid way, and perhaps it may be due to the fact that the public is realizing that there can be no stable social conditions or real prosperity until agriculture is placed on a sound financial basis:

The law-makers seem to be responsive to the general public demand for strict governmental economy and the adoption of a pay-as-you-go policy. Appropriation requests are being cut to the limit and no new or radical expenditures have been sanctioned. A bill has been passed which will suspend for two years at least the payment of state rewards on highways.

Corporation Tax Extended

It is generally agreed that there is great injustice in the present distribution of the taxation burden in Michigan and the Legislature has been carefully considering various proposals looking to a more equitable solution of this perplexing problem. One of the first moves along this line was an amendment to the corporation tax law which will lower the minimum from $50 to $10 and considerably raise the maximum above the present limit of $10,000. The exact maximum is yet a subject of disagreement between the Senate and the House. The Senate placed the figure at $50,000 while the House wishes to assess the large coroporations still more and would place the maximum figure at $450,000. Both branches have agreed to reduce the rate from 3½ mills to 2½ mills on the capital stock and surplus of the coroporation.

The Byrum Income Tax

Perhaps the most far reaching of all the proposed taxation changes now being considered is Representative Byrum's state income tax. This measure would provide a straight 4 per cent tax on all personal incomes in Michigan after exempting $1,000 for a single person, $2,000 for a married and $400 for each child under 18 years, or other dependent. This tax, which would yield $16,000,000 or $18,000,000 annually would entirely replace the general property tax for state purposes. It would thus shift the burden of state support from real estate and personal property which is already struggling under the heavy load of county, township, city, village, school and highway support and would place it upon those having comfortable incomes many of whom are not now paying any taxes, except perhaps the federal income taxes.

During the past week this state income tax measure has been passed by the House of Representatives and is now being considered in the Senate. Enemies of the income tax are, of course, extremely active and if the measure is to receive support in the Senate the members of that body must be assured that here is a strong demand for it in their local communities. When this bill was up in the House it was agreed by all that it was the best state income tax which they had ever studied and that its enactment into the laws of Michigan would be a credit to the state.

Debate over this bill chiefly centered around Rep. Geo. Watson's proposal to attach a referendum clause to the bill which would require its submission to the voters before becoming effective. This motion was finally defeated and probably this fact lost many votes for the bill, but it was finally passed with votes to spare.

Many representatives who were personally strongly in favor of a state income tax voted against the Byrum bill because the voters in their home districts had voted down the state income tax constitutional amendment at the last general election. Many of these representatives admitted that the voters in their districts were mislead as to just how the income tax would effect them, and so voted against it when in reality they would have been greatly benefited by its passage. However they did not care to place themselves in a position of seeming to know more about what was good for the voters than the voters themselves knew.

Rep. Nevins pointed out that there were two or three voters to each tax payer in Michigan and so it would be hard to get the salaried men and those securing their income from investments in tangible property to vote an income tax upon themselves. He felt that it was up to the legislature to decide this matter directly. Rep. John Espie of Clinton county called attention to the large proportion of the wealth and earning power of the state which is not contributing to its support, and declared, "this state cannot exist half taxed and half tax-free."

Rep. Byrum, father of the bill, in a masterly address urging the passage of his measure, called attention to the general sentiment which has developed throughout the State calling for a reduction of the levy on general property and a redistribution of the burden of governmental support. He quoted official figures showing the increase in taxes during the last two decades and pointed out that an ever increasing proportion of the property of the State is unable to pay these taxes. He declared that this proposed income tax would not be burdensome on any individual, but would tax all in proportion to their ability to pay and that it would produce about $18,000,000 annually, which would be sufficient to finance the State without any general property tax for this purpose.

He pointed ont that by making the general property tax a purely local matter it would encourage local economy, because high property taxes could not then be blamed on the action of the Legislature. Local economy is after all of first importance because 87 percent of all taxes are local and only 13 per cent go to the state.

Highway Funds Biggest Problem

Early in the present session it was realized that one of the biggest taxation problems of the state was the matter of raising funds for highway purposes. Not only did this require larger amounts for construction of new roads and the maintenance of roads already built, but there was also the matter of the interest and principal of the $32,000,000 of state highway bonds which had been issued and for which no arrangements had been made regarding final payment.

After thorough analysis of this situation it was decided by many of the leading law makers that a two cent gasoline tax would be the most workable and most equitable solution of this perplexing problem. In accordance with this decision the Warner two cent gasoline tax was passed through both the House and the Senate by substantial majorities. However, the Governor vetoed this bill and so the fight was lost for this session at least. The Senate now appears willing to submit to the Governor's desire for a weight tax on automobiles to bring in the needed increase in revenue.

Farmers Want Tax Commission

There is every indication that the Legislature will yield to the desires of the farmers' organizations of the state to retain the present state taxation commission. It was proposed to abolish this commission and create a state department of taxation to be controlled by one commissioner to be appointed by the governor at an annual salary of $6,000. It was openly rumored that it was the plan to fill this position with a Detroit man. In view of the great power which he would have over the assessment and equalization throughout the state it would certainly not be advantageous to the rural districts to centralize so much authority in regard to taxation in the hands of a Wayne County sympathizer. The bill never got out of the committee and we trust that it never will.

Covert Act May be Amended

Abuses of the Covert highway law led to a strong feeling among many people and some of the representatives that this law should be repealed. This moverment went so far that Rep. Peter Lennon of Genessee introduced a bill calling for the repeal of this measure. However, after thorough study of the situation it has been decided that the objectionable features of the law may be removed while some of its advantages may be retained. Consequently several amendments to safeguard the Covert act are now receiving consideration and will no doubt become law.

The Meggison Primary Bill

An equalization of the opportunity for securing a primary school education in all parts of the state is being sought through the passage of the Meggison bill providing for a new method of distributing the primary school interest fund. Under the present law this valuable state aid is apportioned directly in accordance with the school census of the several districts with no regard to the number of students attending school or to the ability of the district to support schools.

The Meggison bill which has already passed the House by a vote of 72 to 22 provides that the fund shall be distributed directly in proportion to the school census of the district, directly in proportion to the school attendance of children from that district and inversely in proportion to the equalized assessed valuation of the district. The enactment of this law will give the aid in proportion as it is needed and will be a great boon to the proper and more sparsely populated districts of the state where the valuation per school child is very low and where the rate for school purposes is consequently high at present. If this bill passes the Senate it will be, no doubt, the greatest advance in educational progress which has ever been made possible by action of the Michigan State Legislature.

New York Dairy League Sets Pace For Michigan

Big distribution plant of the Dairymen's League Cooperative Association at Avenue B and 19th Street, New York City. This modern distribution plant located in the heart of the metropolis was purchased by the League and taken over on September 1, 1922. A large part of the pooled milk of the association goes direct to this plant in New York, from which it is delivered to the wholesale and retail trade. When they are not busy distributing milk the big trucks connected with this plant, are delivering cases of "Dairylea" evaporated milk, which is the brand name recently adopted by the association for this product.

How Seventy Thousand New York Dairymen Have Turned Salesmen and Are Putting Punch Into Cooperative Marketing

NEW YORK STATE furnishes the greater part of the raw milk consumed in America's first city. Michigan furnishes an even greater proportion of the milk used by America's fourth city. Our milk producers problems are therefore identical. Detroit and the other metropolitan cities of Michigan have sprung up in a decade. New York has had years of experience. The Business Farmer wants the Michigan milk producers to study and profit by what the New York Dairy League has accomplished. Correspondence from our readers on this subject is especially invited. —The Editor.

By DEWEY J. CARTER
Editor Dairymen's League News

NEW YORK CITY is quite used to waking up in the morning and finding its mental citadels under bombardment from the advertising batteries of some new kind of tooth paste, face powder, or chewing gum or even sometimes a new kind of food product. It has become a habit for New Yorkers to spend much of their time reading advertising signs in the subways, railroad stations, and newspapers. But New York woke up the other morning to find not only a new brand of food product before its eyes but a new brand put out by a new kind of business organization. It was advertising put out by 70,000 farmers, telling about a product as old as the hills and one that is on the tables of young and old in some form or other almost every day in the year; namely, milk and more specifically evaporated milk, on the market under the brand "Dairylea," the new trade name of the Dairymen's League Cooperative Association, Inc. Authorities say that it is the biggest and best food product campaign that New Yorkers have ever enjoyed.

The big gun in the great battery of outdoor signs of the League in New York is an animated electric sign at the north end of Longacre Square between Broadway and Seventh Avenue. Eleven so-called "high spots" illuminated at night make up the secondary battery while there are two hundred and sixty-five painted walls scattered throughout the length and breadth of Manhattan and Brooklyn. Of course, along with this is linked up a comprehensive campaign of advertising in the newspapers, magazines, subway trains, and retail stores. These 70,000 dairy farmers of New York State and vicinity who make up this giant marketing association have adopted the methods of big business to get their message to New Yorkers and they are succeeding.

Of course, along with this advertising the association has turned loose upon New York and Philadelphia a group of about forty high powered salesmen who have been selling this farmer brand of evaporated milk almost as fast as the association plants could make it.

Took Cow to Start Campaign

The first inkling that New York had that the dairy farmers of the League had something up their sleeves was when the association presented a fine Holstein cow to the Central Park animal farm. In his presentation speech, President G. W. Slocum of the League said that the association was giving this cow to the city because there was so many little boys and girls learning to drink good pure milk who did not know anything about how it was obtained. Dr. R. S. Copeland, at that time Health Commissioner of New York but later elected to the senate of the United States, who accepted "Dairylea", which by the way was the name of this cow, on behalf of the city, expressed his great joy and satisfaction at the appropriateness of the gift. New York newspapers and newspapers in many other parts of the country carried long stories about this gift of the League Farmers to the metropolis. Suffice to say that "Dairylea" has proved herself to be one of the best mixers in the park zoo and is rapidly becoming the most popular member of the animal family in the park.

This was the first time that the name "Dairylea" appeared in the New York papers but it has appeared many times since and the high quality of the farmer made evaporated milk which is being sold under this brand name is now going to many thousands of homes in New York and Philadelphia.

We can't enter into the details of the selling campaign here but there is certainly one feature of it that ought to be mentioned, and that is that the entire operation from the time the milk leaves the udder of the cow until it reaches the retailer's counter is in the control of the farmers association. Their dairies produce it. Their plants manufacture it. It leaves them for a time while it is being transported by railroad to New York but there the League's own trucks pick it up again and eventually deliver it at the door of the retailer. In other words, the farmers of this association, so far as New York is concerned, have constituted themselves producers, manufacturers, wholesalers, and salesmen. The result is that the association is receiving for its evaporated milk the full advertised price without any deduction for middlemen's services.

Dairymen's League plant at Carthage, N. Y. This building was formerly used as a factory but was entirely remodeled under the direction of the League's own engineering department. It is one of the best equipped shipping and manufacturing plants which the association owns. During the present season this plant is turning out over 1500 gallons per day of the popular League ice cream.

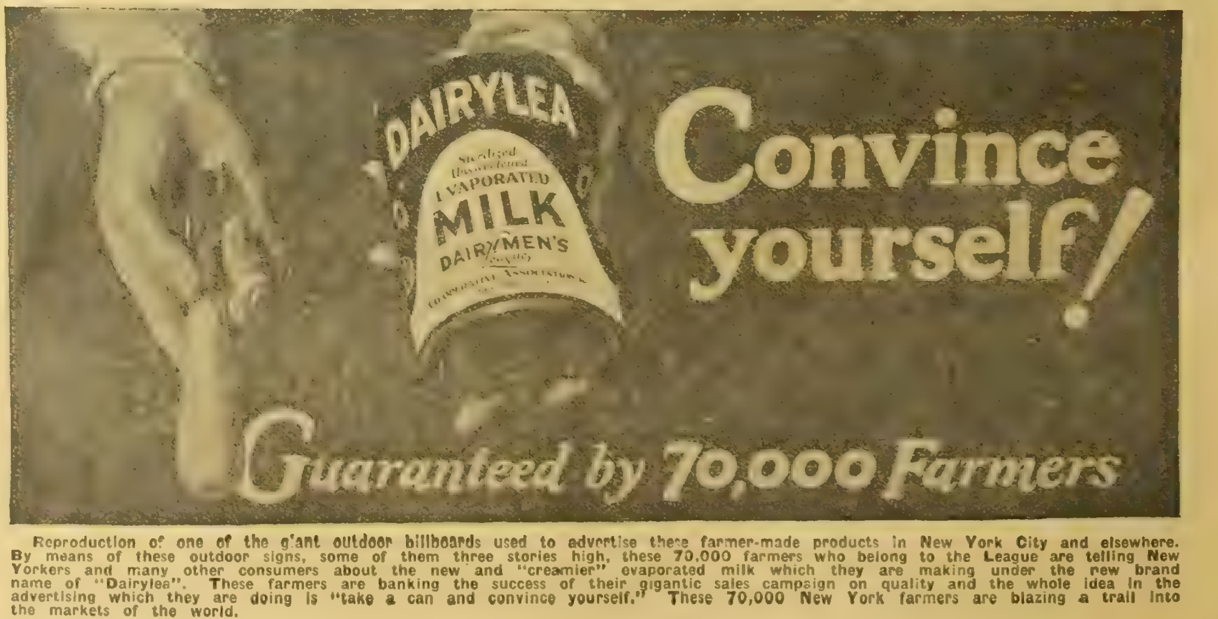
This advertising and selling campaign will gradually be extended to other large centers and over the entire eastern half of the United States. Nothing like it has ever been attempted by dairymen anywhere in the world. It is doubtful if any more businesslike merchandising campaign has ever been put on by any group of farmers anywhere.

It is evident that the League dairymen planned to do something big on a big scale and effective when they hired as sales and advertising director some few months ago Mr. S. Q. Grady, formerly acting in the same capacity with the Raisin Growers of California. Cooperative marketing of dairy products under a brand new name has been preached for some time but it remained for the New York State dairymen to achieve the first big results.

Farmer Made Ice Cream Too

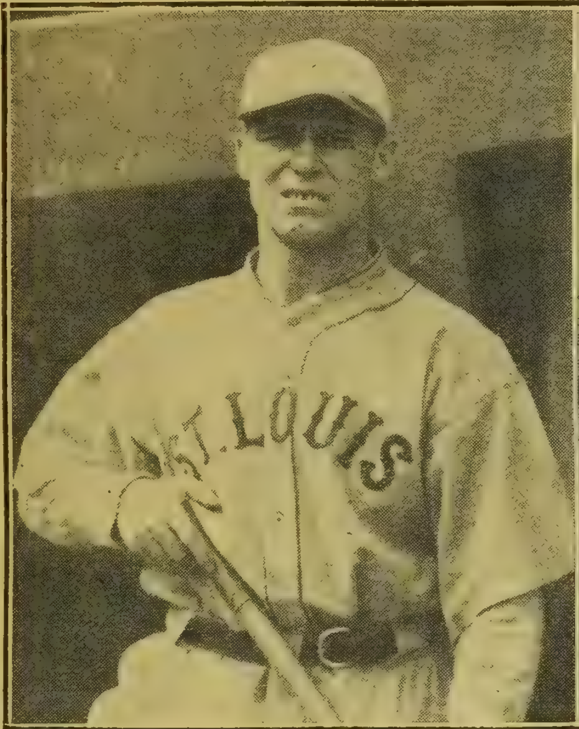
And this is not all. The League is anticipating great increases in its ice cream output during the approaching season. The three manufacturing plants of the association are so located that unfortunately League ice cream cannot be distributed to New York City but it will be distributed throughout a large portion of the state the same as last year. The selling of 430,000 gallons of League ice cream last season broke all first season records in the history of ice cream manufacturing. Its high quality was proclaimed everywhere. The pooling dairymen

(Continued on page 25.)

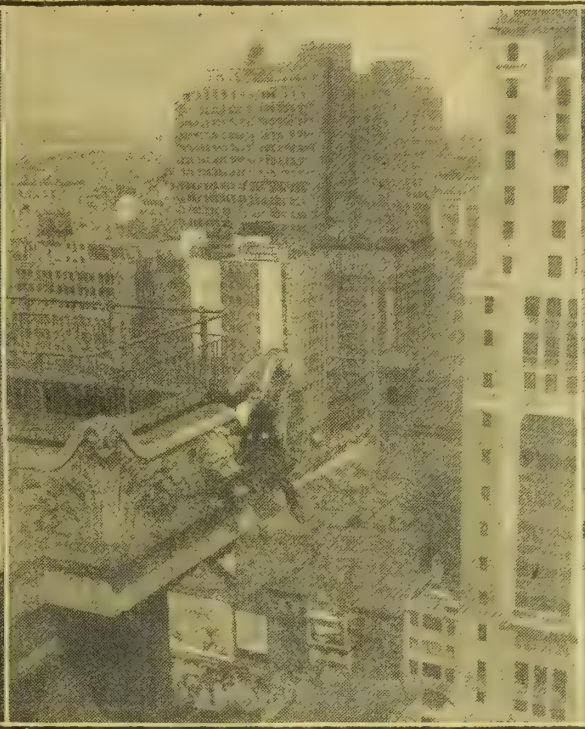


Reproduction of one of the giant outdoor billboards used to advertise these farmer-made products in New York City and elsewhere. By means of these outdoor signs, some of them three stories high, these 70,000 farmers who belong to the League are telling New Yorkers and many other consumers about the new and "creamier" evaporated milk which they are making under the new brand name of "Dairylea". These farmers are banking the success of their gigantic sales campaign on quality and the whole idea in the advertising which they are doing is "take a can and convince yourself." These 70,000 New York farmers are blazing a trail into the markets of the world.

PICTURES FROM FAR AND NEAR

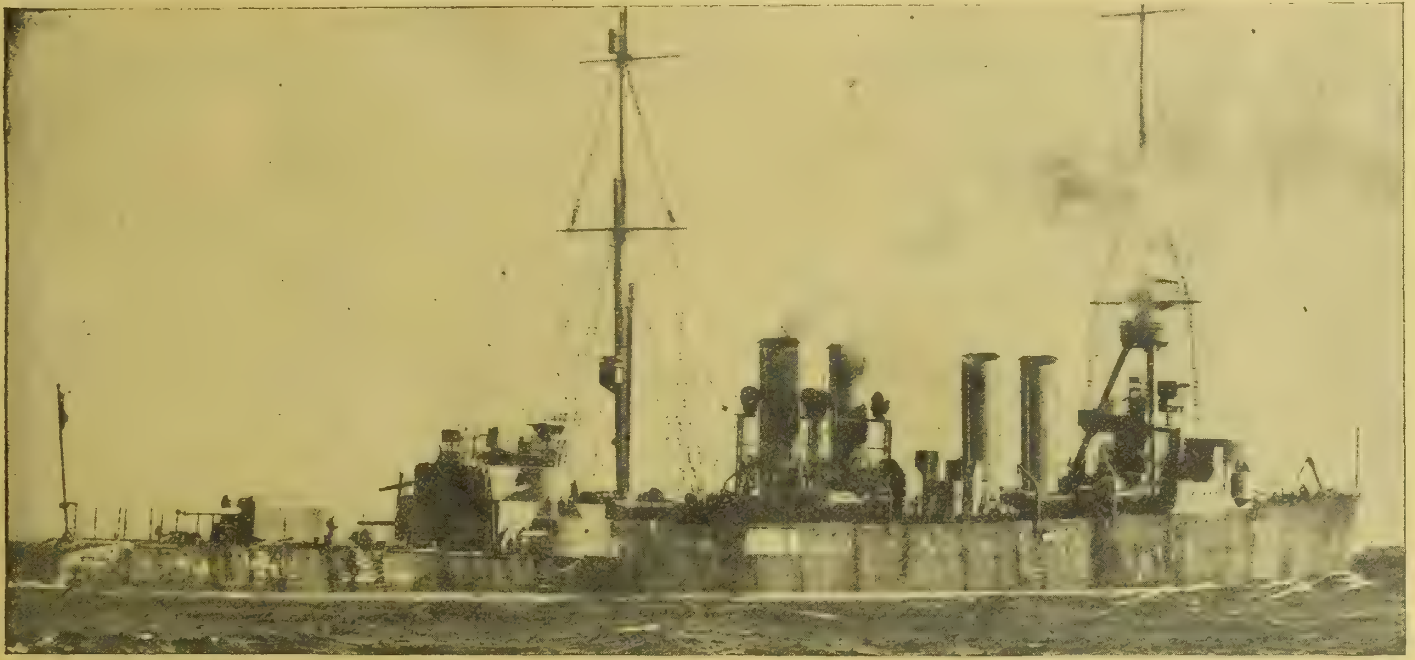


MAY NEVER PLAY BALL AGAIN.—George H. Sisler, famous player of the St. Louis Browns, who, it is reported will not play ball this season, and possibly will never appear on the diamond again. Sisler's eyes are bothering him. He sees "double" and even the best physicians in this country seem to be unable to remedy his trouble.



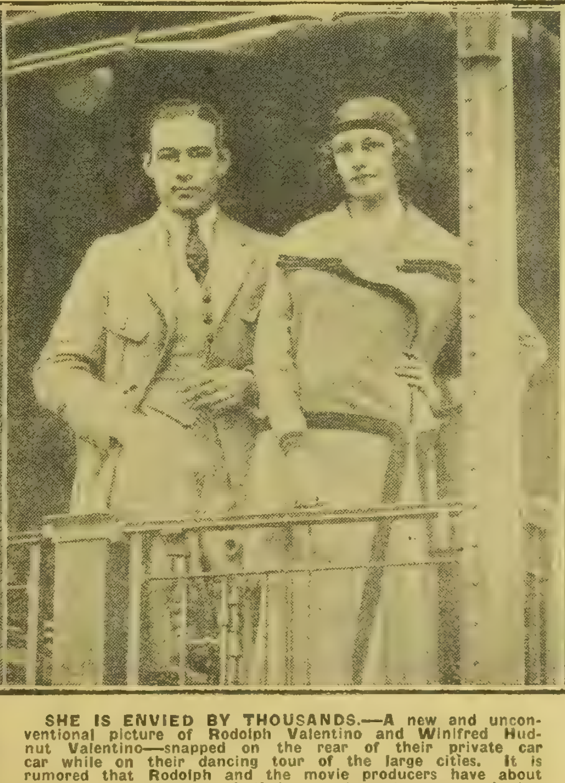
LOOK OUT—YOU'LL FALL!—Carlo Aldini, known as the "Douglas Fairbanks" of Germany, who heads a German film company is seen here on top of a New York sky-scraper doing a few stunts. This is the first German film company to come to New York to get proper settings for movie thrillers. None of it for us. We prefer to keep at least one foot on solid earth.

VENUS NEWLY RISEN FROM THE WAVES.—Venus Anadyomene, queen of the winter bathing beauties, at San Antonio, returns from communion with Father Neptune. No, the draperied mass is not a veil of moss, but her natural, home grown raven tresses, which measure 58 inches in length.



CRUISER "DETROIT", NEW SPEED QUEEN OF UNITED STATES NAVY.---Michigan's metropolis and America's fourth city has been signally honored by having the speediest boat in the navy named after her. Reports say that her maiden trial trip which was showed her to have a speed of 30 knots per hour, the fastest ship of her size in the world. The new "Detroit" represents a class of speed cruisers developed from the experience in the late war, when it was proven that the heavier and slower boats were too vulnerable to the aerial attacks of bomb carrying aeroplanes. The new type of tripod mast, superseding the basket construction is shown on this new ship and her long lines suggest more of the torpedo-boat destroyer, than the heavier cruiser. She will carry a crew of over 1,000 men. The city of Detroit presented the ship with a beautiful ships clock, suitably engraved and of the finest workmanship. Perhaps with the "lakes to ocean" canal opened up, the cruiser "Detroit," may sometimes visit the proud city whose name she so fittingly bears. It has been suggested that the "Detroit" be manned with men whose homes are in Michigan.

TO TEACH AMERICAN METHODS IN PHILIPPINES.—Miss Pilar P. Herrera, a graduate of the University of the Philippines and former instructor in chemistry in the same university, who will receive her PH. D. at Columbia University. Upon her frail shoulders she has taken the task of attempting to inculcate American methods of education in her native country.



SHE IS ENVIED BY THOUSANDS.—A new and unconventional picture of Rodolph Valentino and Winifred Hudnut Valentino—snapped on the rear of their private car car while on their dancing tour of the large cities. It is rumored that Rodolph and the movie producers have about come to a settlement of their recent controversy and that he is soon to return to the pictures.

CIVIL WAR VETERAN STILL ON ACTIVE DUTY. Nat Poyntz who is perhaps the only veteran of the Civil War who served in the Confederate Army and is now on duty in the U. S. Army. He holds the post of field clerk in the Quartermaster Corps, assigned to duty at the Army Base, South Boston. Nat is 76 years old and was born in Maysville, Mason County, Ky. He joined the Confederate Army at the age of 14.

Dug Well Adequately Protected Against Surface Contamination

By W. A. HARDENBERGH

THE water supply for the average country or farm home comes from a well or a spring. Wells and springs may furnish fine water, or they may furnish water so unfit for drinking as to cause disease or death. In a limestone section there are usually many fine springs. Unfortunately, a good proportion of these are so contaminated that the water is unfit to drink. Many wells are in the same bad condition. Most of this contamination, however, is due to causes which the farmer can remedy easily at small cost.

Springs.—While springs are sometimes contaminated from sources of pollution a long distance away, most of the trouble comes from nearby places, such as an open privy, surface drainage from the barn yard or road, and similar easily preventable causes. To eliminate these, a sanitary privy should be built, and surface drainage diverted from the spring.

The best way to prevent surface drainage from entering and contaminating the water is to dig out the spring carefully, going down into the ground 18 to 24 inches, and then walling up around the spring with a tight wall and covering with a tight cover, so that surface and rain water, animals and dirt cannot get in. A concrete mortar does very well. The main object is to keep contamination out of the spring. A pipe in the wall makes a good outlet for the water and prevents contamination by dipping into the spring.

Wells.—There are various kinds of wells, as shallow and deep; dug, driven, or bored. The shallow dug well, especially when it has an open top, with a bucket to be let down into the well, is nearly always contaminated in some way, though not always, of course, so as to produce sickness or death.

Most of this contamination, except in wells less than 8 or 10 feet deep, enters from the top. In other words, the ground water, especially when it is 8 or 10 feet down is usually fairly pure. But filth from the shoes of persons using the well, from pigs and dogs, and from the feet of chickens which may have been scratching around an open privy, enter through or around the cover and polutes the water, frequently causing disease.

Dug wells are usually 3 or 4 feet in diameter and loosely walled with stone, or occasionally with brick, but the walls are seldom water tight. Contamination from the ground surface easily passes down and around the cover, which is often nothing more than rotting boards, and through the loose wall into the water. Usually it is also easy for pollution to soak directly through the board cover into the well. Even a stone cover allows plenty of chance for the entrance of filth and contamination.

The driven well is better, for the iron pipe is tight all the way to the ground water, but there should be protection around the top to prevent the passage of surface wash down along the pipe to the ground water.

Open top wells with buckets are most dangerous, for they allow dirt and animals to enter; while the bucket, handled by every user, is usually soiled with many kinds of dirt and filth. The bucket ought to be replaced with a pump, and the well protected with a tight top and casing.

Of equal importance is a tight top. This should be made of concrete, as shown. Dig out around the well to a depth of 6 inches for 2 or 3 feet back from the well hole. Lay timbers across to hold the concrete, while setting, and pour the cover, placing the pump so there will be no leakage around it; or the cover may be poured in another place and moved over the well. In either case, reinforcing is desirable, if the well is more that 30 inches in diameter. Wagon axles, iron rods,, iron pipe, etc., make good reinforcing.—The Progressive Farmer.

Is Organization Helping the Potato Men?

By KRIS P. BEMIS, Mason County Agricultural Agent

WHAT is organization doing for the potato grower? That question confronts potato growers as they look back upon the past season, with its over-production in the Northwestern States, due to plunging in potatoes by owners of sow-thistle infested wheat land.

The Michigan Potato Growers Exchange at Cadillac, now affiliated with the Farm Bureau, offers the only grower-controlled agency for selling potatoes in Michigan. It sells for co-operative farmers' associations only, and is run from the bottom up. It is out to get every cent it can for the grower.

Most of you will remember that back in March, in that period of

(Continued on Page 23)

U. S. Weather Bureau Explodes Theory that Man Can Cause Rainfall

RAIN-MAKING is a futile undertaking, according to the Weather Bureau, United States Department of Agriculture. To produce one inch of rainfall over an area of an acre, approximately 113 tons of moisture would have to be drawn up into the air and then precipitated. There are 640 acres in a square mile, for which 72,320 tons of moisture would be required. A square mile, however, would be scarcely a dot in the center of any section where drought prevails, as in Arizona or parts of Texas. It would be less than one-seventh of the area of the District of Columbia.

Enormous forces are required in nature to elevate moisture above the earth before it can be precipitated. Billions of horsepower are represented in the cloud that separate over the house-tops; and even if some artificial means were found to cause the aggregation and fall as rain of the infinitesimal drops of which it is made up, calculation shows that only a trifling amount of precipitation would result. There must be some way by which the moisture laden atmosphere can be lifted to a considerably higher altitude, to lower its temperature and thus precipitate a considerable part of its moisture content.

It is quite true that in the laboratory a small amount of moisture can be precipitated by the use of special equipment. Meteoroligists of the Weather Bureau of the U. S. Department of Agriculture say that they do not know of any scheme for the artificial production of rain on a scale of practical magnitude, nor for otherwise affecting atmospheric behavior. Widespread drought is due to lack of sufficient moisture in the atmosphere and the absence of other conditions essential to the formation of rain. If there is little moisture to bring down, obviously no device for causing rain artificially has any value, because of the absurdity of supposing that human agencies can supply adequate amounts of water for extended areas when the atmosphere itself is practically dry.

In spite of these facts, statements appear at intervals in the press heralding new ways of making rain, preventing rain or fog, or forestalling the disastrous effects of storms. These ideas are not new. Ten years or more ago certain countries in Europe were thrown into excitement, reflected in the newspapers, over the possibility of a scheme called "hail-shooting." It was believed that by shooting bombs into the air before an oncoming storm it could be dissipated, thus averting consequent destruction to crops from rain or hail. Contrary to the opinions of the best meteorologists a good deal of money was spent in experimenting with "hail-shooting," but little is ever heard of it now.

More recently, in our own country, a man achieved prominence by advertising a contrivance, which he proposed to build at various points where more rain would be welcome. This scheme was entirely from proposals to shoot bombs, sprinkle hygroscopic or nonhygroscopic dust particles in the air, or electrified sand, to induce precipitation. It consisted of powerful fans at the base of high towers for forcing upward great quantities of air and thus stimulating the conditions which occur in storms and cyclones when rain is produced. This plan is futile and economically impossible.

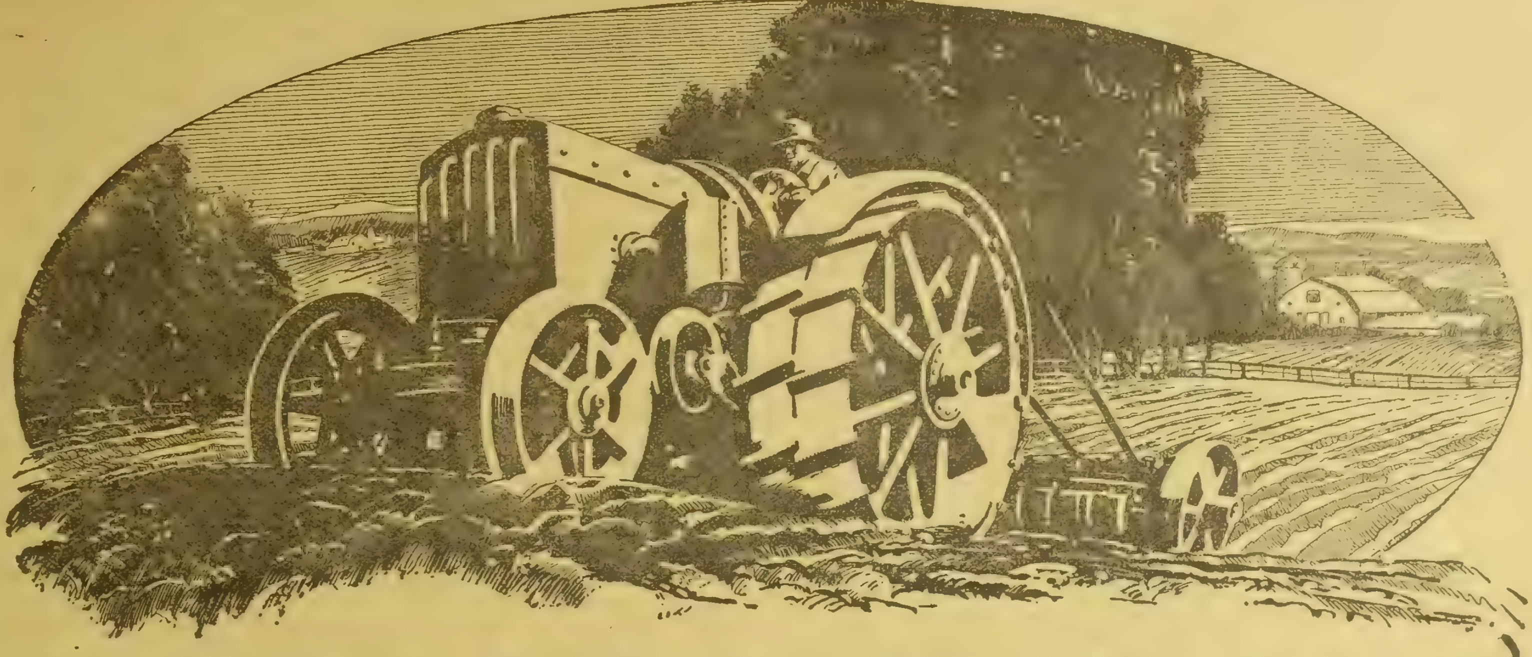
The case of the man who contracted with farmers in drought-stricken regions to produce an inch or more of rainfall within a period of two or three months for a consideration of $1,000 per inch is well known. This man, claimed to be able to cause rain by a secret process with the use of chemicals. If the rain came and the man collected his fees; if the rain failed he lost nothing. Now the average amount of rain for each region is accurately recorded, and under a long drought and within the limits of the record a shrewd operator is quite safe in promising precipitation and collecting $1,000 per inch from desperate farmers.

A recent proposal is to cause precipitation by sprinkling dust particles in the air by means of apparatus carried on airplanes, on the theory that these will aid condensation. Cloudiness due to dust particles, however, takes place long before precipitation occurs, and frequently continues after the rain is over, indicating that the motes and dust particles do not necessarily cause precipitation. If clear weather follows rainfall, it may be because new dry air has moved in from other localities.

Presence or absence of dust particles in the atmosphere does not, in the opinion of meteorologists, have any thing to do with the distribution of rainfall. As a rule, far more dust particles are present in the atmosphere everywhere than would be essential, were the dust hypothesis correct, to bring about abundance of precipitation. On the other hand, enormous quantities of rainfall occur over the ocean where there is least dust. Some places in the Hawaiian Islands have an annual rainfall exceeding 500 inches, and yet the air is nearly dust free. The most dust in the atmosphere, except near industrial cities, occurs over dry and semi-arid regions.

The suggestion has also been made that powdered quicklime be employed to precipitate moisture. On this point the Weather Bureau says that dry, powdered quicklime, exposed to the atmosphere absorbs a certain quantity of moisture—that is, it dries the air. Dry quicklime is used in many industrial operations for drying gasses. The moisture absorbed in these cases completely disappears as available water and forms new chemical compound commonly called air-slacked lime. Unless exceedingly fine, this sprinkled quicklime, after absorbing about one-third of its weight of water, would fall to earth, leaving the air drier than before. Any exceedingly fine particles remaining in the air would very slowly absorb carbon dioxide, also present in the air in very small quantities and form a substance chemically the same as limestone or marble. If the plan to sprinkle dust of some sort into the air were feasible at all, it would therefore appear to be better to sprinkle finely powdered marble in the air in the first place, because this would not rob the atmosphere of any of the moisture present.

All of these schemes, however, are, in the opinion of the Weather Bureau, entirely futile.



Polarine Lubricates Perfectly
137 Makes of Tractors

Polarine lubricates perfectly—137 different makes of tractors. No matter how extreme the temperature—the grade of Polarine indicated in the Chart will remain of the right viscosity. It will spread rapidly. It will form a perfect film between the moving frictional surfaces. It will insure long life to the bearings; complete protection to piston and cylinder.

Changing to Polarine has saved many a farmer hundreds of dollars a year in repair bills. Yet Polarine cost little, if any, more than the lubricant you are using now.

Use Polarine

THE PERFECT MOTOR OIL

Made in Five Grades

It outstrips any lubricant on the market in maintaining its body through any extreme of temperature. Its elasticity and adhesiveness cause a perfect seal and complete lubrication at all motor speeds and temperatures.

Don't fool yourself into fancied security, by thinking, "Oh, the oil I'm using works all right—why bother to change? It's just as good!" There is no "just as good," or even "second best" lubrication. There is one right lubricant for your tractor. It is specified in the Chart. When you do not use this lubricant, you fail to get the maximum of economy, efficiency and saving of wear on your engine. Change your motor oil very frequently—it is the essence of economy.

Remember the resources—the experience—the scientific experts of the Standard Oil Company (Indiana) are behind every gallon of Polarine sold. This means maintained quality—at all seasons, in all temperatures—and everywhere throughout 10 middle Western states.

Farmers Service Bureau

(A Clearing Department for farmers' every day troubles. Prompt, careful attention given to all complaints or requests for information addressed to this department. We are here to serve you. All inquiries must be accompanied by full name and address. Name not used if so requested.)

HAVE MORTGAGE RENEWED

A loaned B a certain amount of money and took a mortgage on B's farm. The mortgage was to run for three years and will expire the 17th of this month. The interest is 7%. the amount A loaned was $1700, and all that B has paid in the last three years is $100. Now A doesn't want the principal or the farm, either. All he wants is the interest. What A wishes to know is this: What is to be done at the expiration of the mortgage to compel B to pay the interest? Or if A is compelled to foreclose, what proceedings must he go to?—A. R. H., Elmira, Mich.

—If A is willing to forego his right of forclosure, it seems that B ought to be willing to pay the interest on the loan without coercion. If he is not willing to do this, suit may be brought to recover the interest alone, without foreclosing the mortgage. A should, upon the termination of the mortgage, have it renewed or take other steps to provide for the security of his loan.—Assistant Legal Editor.

CHANGING SCHOOL DISTICTS

About three years ago I purchased a farm at Lowell, Mich., I did not know at the time that, by request of the owner who had children to educate, it had been set over into the school district of the town of Lowell. Now, I beg that I may be informed as to what proceedure to take to have it set back into the rural school district where it territorially and naturally belongs? Can my right to be set back into the district where this farm formerly was, be questioned? In other words, is there any condition under which I could be compelled to remain in the town district?—D. W., Pennsylvania.

—It would be necessary first that you get the written permission of the board of education of Lowell to have this farm transferred to another district. This permission will have to be granted at a meeting of the school board of Lowell, and a copy of the resolutions granting the permission filed with the township board where this territory is located. The township board may set the territory out into the other district.

The law governing this proceedure is found under Sections 5655-56 of the Compiled Laws of 1915, pages 21-22 of the 1921 school laws, and Section 5737 of the Compiled Laws of 1915, page 68 of the 1921 school laws.—W. L. Coffey, Dept. of Public Instruction.

DEFAULTS IN PAYMENTS

A and B bought 80 acres of land on a contract. They agree to pay $100 per payment. Contract reads $100 or more on January 30th of each year until full amount is paid. A and B are to each pay half and each own a forty. Now B made a payment then sold his contract to C (contract being transferred was again signed by all parties) C sold to D and took a mortgage of $250 and tax said mortgage to X for cash. Now D's payment is due January 30th and he cannot meet it. A had to pay it in order to get hold his forty. The contract being for 80 acres. Agreement for each a forty. What I want to know is: How long must A give D to pay the payment back? If A keeps payments etc., up can he get a deed for the eighty without any trouble? Can X collect that mortgage of $250 which was given unknown to owner and A? The contract was not signed when transferred last time. A's contract has never been changed in any shape or form since first written in 1917. The party holding the mortgage has the other contract, a copy of A's, but mortgage is only pinned on. Is it lawful to pin a mortgage to a contract?—P. E. A., Aloha, Michigan.

—When one of two or more joint purchasers in a land contract pays more than his share of the purchase price, he has a right of contribution from the others for their share. C's transfer to D would give D the same rights and liabilities in the contract that C had. If D defaulted in his payments, and A, in order to prevent forfeiture, keeps up D's payments, then as soon as A had paid the entire purchase price, he could proceed against D for contribution of his share.

The mortgage of the vendee in a land contract takes no greater rights than the vendee had; he simply acquires the right to purchase the property for the consideration stipulated in the contract of purchase, and a right to require a conveyance from the vendor according to the terms of the contract. Consequently C here is liable to A for contribution of D's share of the contract price which A paid, and before C can satisfy his $250 debt out of the mortgaged property, he must make contribution to A for the delinquent payments of D. X, as C's purchaser, or assignee, would be subject to the same liability to A.

If the contract is made to several purchasers jointly, one could not arbitrarily take the title in his own name.—Assistant Legal Editor.

SAWING LUMBER FOR MARKET

Would you please advise me how to cut and saw the following logs? Red oak, maple, elm, ash, white oak and hickory to the best advantage of the manufacturuer? Also how small may I take the trees if they are clear?—C. F. E., St. Clair, Mich.

—I would not advise cutting or sawing until you had taken the matter up directly with the purchaser and obtained the specifications wanted. It usually pays the owner of woodlot timber better to sell his product in logs rather than in lumber. Lumber cut on a portable mill in a farm woodlot is usually either too thick or too thin, does not make the best use of the grades and the purchaser of the lumber, if it goes to a lumber yard or manufacturing establishment, is put to considerable expense and bother in having it gone over by a grade inspector before being accepted. The woodlot operator usually fails to see the justice of the grading and is therefore unsatisfied with his returns.

The minimum diameter to which trees may be cut would depend largely on the use to which the timber was to be put. Bolts for hickory handles must be at least 4 feet long by 6 inches in diameter at the small end. Timber for vehicles and vehicle parts usually requires at least 16 foot logs with a 7 inch diameter at the top. White oak for tight cooperage should be at least 18 inches in diameter and veneer stock the same. The timber usually does not begin to put on "clear" lumber until it gets to be about 14 inches in diameter breast height. The most valuable growth comes from 14 inches D. B. H. to 18 or 20 inches. The growth then usually slows up and decay may set in although the tree may continue sound up to 30 or 40 inches D. B. H.—John C. DeCamp, Assistant Professor, Dept. of Forestry, M. A. C.

ALLOWED 30 DAYS TO REDEEM

I have been a subscriber for your paper for the past few months and note you always help a fellow when he is down. I would like information in regard to a farm contract.

We have a payment due soon, owing to the exceptionally poor financial year we will not be able to meet the principal. The contract is the usual legal form. If the party holding same insists on payment of principal and refuse to continue same, how long could we hold the farm?—Reader, Traverse City, Mich.

—Compiled Laws of 1915, Secs. 13-240-13257 providing for foreclosure of land contracts, provides that the vendee shall be allowed 30 days in which to redeem the premises after judgment is rendered against him in the forclosure proceedings.—Asst. Legal Editor.

KEEPING CHILD AFTER SCHOOL

Would a teacher have the right to make a pupil stay after school each night if he could not pass the monthly tests?—K. Y., Jamestown, Mich.

—The statutes remain silent with reference to the type of punishment that may be administered by the teacher. The Supreme Court has rendered a decision that the teacher has delegated parental control over the children while under her jurisdiction and that she has authority to administer any reasonable punishment. Conditions might arise where in the teacher's judgement the appropriate type of punishment would be to require a child to remain after school.

If in the case in question the pupil's failure was due to wilful neglect or carelessness on his part the teacher might deem it advisable to require him to devote a little extra time to study and special preparation after school.—B. J. Ford, Division of Rural Education, Dept. of Public Instruction.

NO SATISFACTORY METHOD TO CONTROL SPARROWS

What can I do to kill the English sparrows round my barn, something that will not harm chickens, cats or my dog if they should eat it or eat the sparrows?—O. R. D., Mancelona, Mich.

—There is no satisfactory method yet envolved for the control of the English Sparrow. In spite of all the control measures used thus far, the bird maintains its numbers and only by concerted efforts and persistent measures can any relief be assured from the pest. The Government Sparrow Trap, made according to the directions which were issued by the Biological Survey Department of Agricultural, Washington, D. C., is sometimes successful in reducing the number or Sparrows. Persistent destruction of the nests about barns and out-buildings on the farm is also effective. The use of poison has several bad features. Contrary to general belief, there is no poison known which will kill Sparrows and at the same time be harmless to other birds and animals. During the winter season, when snow covers much of the available food and our native birds are in the south, it is possible to use poison with a fair degree of success. At the present time (April) it is not so effective a control measure. The poison usually used is strychnia sulphate. Dissolve one-eighth ounce of strychnine crystals in two quarts of water, then soak four quarts of wheat in this solution for forty-eight hours, and spread out in a safe place to dry. Bait the Sparrows to a selected feeding place inaccessible to birds, doves or poultry and when they are accustomed to coming there to feed, spread out poisoned grain. Pick up the bodies of dead birds, sweep up poisoned grain not eaten, and burn both. Since this poison is dangerous to all animals and birds, handle it with extreme care.—Allen C. Couger, Associate Prof. of Zoology, M. A. C.

BELIEVES HE IS OVERTAXED

I am writing in regard to our taxes on 8 acres of land. The valuation is $1,180 and the taxes for this year $70.12. There is no personal property on the place. If the taxes were $70.80 that makes 6 cents on the dollar. Is it lawful for that town to tax it that high? If so, what are the limitations? How much can they lawfully assess on a dollar?—O. L., Ellsworth, Michigan.

—The amount of money a township may raise by taxation for ordinary expenses is limited by law, the maximum amount depending upon the population of the township. This does not apply to levies for specific purposes, however, and in order to determine whether you are over-taxed it would be necessary to investigate the tax rolls and ascertain for what purposes the taxes are levied, and whether the limit is exceeded for any of those items:—Asst. Legal Editor.

HORSEHIDE ROBE

I would like to know how to soften a spot about a foot square, in a horsehide robe, which was caused by placing it over a frozen radiator while thawing it out. (The radiator contained a solution of about 50 per cent alcohol.) The steam of the solution caused the robe to harden. —B. D. R., Holland, Mich.

—Try applying butter (not salted) lard or most animal fat. If this has no effect, try using warm water to first soften and them apply the fat or most animal oil. The work should be done in a warm room and the hide rubbed and worked for an hour or more, giving several applications of the butter, lard or whatever you are using.—Fur Editor.

SIGNS OF OIL

We have an open well about 7 feet deep where we water our cattle and horses in the winter, and there is always oil on top. Some days so much that we have to dip off the top or the horses will not drink it at all. It has been like that for years. Do you think it might be an oil well? Do you think we ought to have it analyzed?—Mrs. G. D. B., Conway, Mich.

—As to the significance of the signs described, I would advise that in

southeastern Michigan such signs appear to have no significance other than indicating that oil formations are present. There is a belt extending through southeastern Michigan in which seegages of oil and gas are very common about ponds, around springs, and in wells. In fact in many places the seepages are sufficient to make the water unfit for stock use even, except in the manner described. Some of the farmers in the vicinity of Royal Oak and Warren, northwest of Detroit, find so much gas in their water wells that they separate the water and use the gas for heating and lighting purposes. Some of these wells last several years. There are large gas springs throughout the belt extending from Alcona county northward, in an arc around to Manistee where geological conditions are similar to those in southeastern Michigan.

The reason for these signs appears to lie in the fact that the above described belts lie directly over the edges of formations which are known to contain oil and gas. These substances are constantly escaping from the edges of these formations upward into the sands and gravels in the surface deposits which cover the underlaying bed rocks. The surface seepages may be some miles away from the pools if they exist. There is little to indicate just where the most favorable places are for the occurrence of pools. There are definite possibilities for oil throughout the belt extending from north of Port Huron southeastward into Ohio. Many small oil and gas wells have been drilled in and about Port Huron. The Mt. Clemens mineral wells yield very considerable quantities of gas and some of them have yielded oil. At least one of the bath houses uses gas from its wells to aid in firing its boilers.

Judging from your address your farm lies in the northern belt of seepages. Anywhere in the belt northeastward around to Alcona County would be favorable for such phenomenon. The largest surface gas well ever struck in Michigan was on Portage Lake, just north of Manistee. The oil formations lie directly beneath conway and seepages in that region are to be expected.

As to analysis of the sample, I would advise that if you send us a sample of the oil as skimmed from the water we would be very pleased to make a qualitative chemical examination, free of charge. We would like, however, an exact description of the occurance, the precise location, and any other information which might have any bearing on the explanation of the local causes.—R. A. Smith, State Geologist.

CAN RECOVER FROM COMPANY

Last November I sold my white pea beans at the elevator and I asked them to screen three bushels of them and save them for me, which they said they would and so I paid them for screening them. The elevator at that time wasn't in working condition, therefore they couldn't screen them that day. When I went to get the beans they said they had forgotten to save out the beans but admitted they remembered my telling them to save and screen three bushels. They wanted me to take three bushels of beans which they had gotten in afterward but wanted me to pay the difference in price; in the meantime beans had raised in price. I have called them up a number of times and they keep putting me off. I understand they have quit buying produce now and the building is up for sale. How can I get my seed beans? I am not in a financial condition that I can stand to lose these beans.—N. R., Sand Lake, Mich.

—If you left the beans with the elevator company with instructions to screen and save them for you, and they failed to save them, I am of the opinion you could recover from the company whatever amount would be sufficient to purchase the same amount of beans, of like quality, at the present market price.—Asst. Legal Editor.

GROWTH OF SWEET CLOVER FIRST SEASON

I would like to ask you a question on sweet clover. If it was sowed with just a few oats could I cut hay off it this year? When should it be cut? What is its feed value? Is it equal to alfalfa?—R. S., Harrison, Mich.

—The growth made by sweet clover the first season will depend very largely upon soil and seasonal conditions. When the soil is well supplied with lime, of fair fertility, and there is plenty of rainfall, sweet clover usually produces a crop of hay the same season as sown. However, if the soil is inclined to be somewhat acid, or the season a little too dry, sweet clover will not make much of a growth. It should be cut early enough so that the plants will make five or six inches of top growth to prevent winterkilling. Sweet clover is a leguminous crop and the hay is quite high in feeding value, but hardly equal to alfalfa hay.—C. R. Megee, Farm Crops Dept., Mich. Agricultural College.

OFFERED TO PAY TAXES

A buys a lot from B. A resides in one county and the lot is located in another county. Said lot to be in a subdivision near a certain city, it being an eighty acre description which was laid out in blocks and lots. The purchase was made in the year 1916 B furnished A a warranty deed, said being on record in said county, showing Liber and Page number, etc. A has been making inquiry from year to year as to the amount of taxes due on his lot, always giving his correct description, but he was always informed that said tract was not assessed in lots but as acreage and that they had no other way of collecting the taxes than such. A again makes inquiry for the year 1922 and receives the following answer: That said tract is still assessed as acreage and this plat will never be recorded, so it will always continue to be assessed as eighty acres of land. The taxes on the above eighty acres of land are unpaid on the records of this office for the years 1919, 1920, 1921, Signed "County Treasurer." I wish to ask your consideration on what steps to take in order to avoid having said lot sold for taxes. Could the eighty acres (including this lot) be sold for taxes under such circumstances, for A has offered to pay his tax but was always denied of being any taxes against him?—R. E. D., Tawas City, Mich.

—Compiled Laws of Michigan, 1915, Sec. 4049 provides that "any person owning an undivided share or other part or parcel of real property, assessed in one description, may pay on the part thus owned by paying an amount having the same relation to the whole tax as the part on which payment is made has to the whole parcel. The person making such payment shall accurately describe the part or share on which he makes payment * * *"

If, upon offering to pay your taxes, you are told by the township treasurer that no taxes are due, and, relying upon such statement, you do not pay them, your land could not be sold for delinquent taxes.—Asst. Legal Editor.

RABBIT HIDE TANNING

Would you please tell me through the columns of The Business Farmer how to tan rabbit hides with the fur on?—A. E. P., Detroit, Mich.

—Take a quart of oatmeal, a half pound of powdered alum and the same amount of salt; mix and add soft water enought to make a thick paste. Stretch the skin on a board, flesh side out and apply the paste, spreading it on about a half inch

Essex Stays Young

Because of Hidden Values

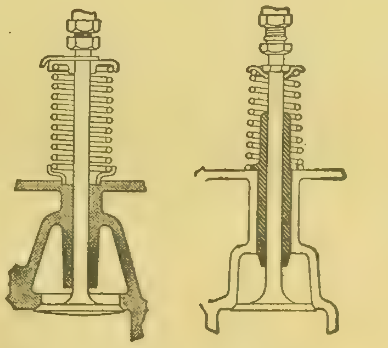
In Essex particular attention is bestowed on hidden values.

Finest roller bearings are used throughout, where commonly bushings are used. For weight carried the frame is the sturdiest built, save one. European and American experts call its chassis the finest of its size.

Easily made adjustments keep the car snug and free of noise. Essex design and construction minimize service needs, and account for its remarkable acknowledgment among owners as a long life car.

Essex cars that have seen 50,000 and 60,000 miles of service are today as dependable as when new. And they continue the economy of their first cost in years of reliable service.

Another Essex Feature Giving Low Maintenance Cost and Good Service



Essex removable valve guides (at left) are simple to replace when worn. Greater length gives perfect alignment. **At Right** the ordinary type, not removable, can only be repaired by a costly, unsatisfactory operation.

What Present Legislature Has Accomplished

(Continued from Page 3)

Bovine Tuberculosis Eradication

Farm organizations and pure-bred live stock associations have united behind an adequate five-year program for the eradication of bovine tuberculosis in Michigan. A bill has already passed both branches of the legislature which paves the way for county co-operation in carrying out this work and an adequate appropriation bill to finance the indemnities on condemned cattle during the next two years is receiving favorable consideration in the Senate. If this disease can be checked and stamped out in Michigan it will be of great direct financial benefit to Michigan farmers and dairymen and will promote the health of Michigan citizens.

A Foresting Measure

From the standpoint of the northern part of the state perhaps one of the most important bills is Rep. Meggison's measure which is intended to promote useful forest growth in the state. One of its chief provisions allows land carrying a satisfactory timber stand to be taxed annually on its bare-land value without regard to the value of the timber which is accumulating. Then at the time when the timber is matured and ready for market a harvest tax would be assessed.

Friends of the bill point out that an annual tax on the accumulated value of all of the stand of timber is not adapted to such a long-time crop and that in actual operation it results in the timber being harvested long before it is mature. It is thought that this bill would result in more forests in Michigan and in their more efficient handling.

To Curb the "Land-Sharks"

Another measure which has for its purpose the orderly settlement and development of the northern portion of the State is also being sponsored by Rep. Meggison. This bill was drafted by the Development Bureau of the State Department of Agriculture and is the so-called "Land Certification" bill. This bill has been considered for several weeks by the House Judiciary Committee and has finally been so amended that is satisfactory to them and it will, no doubt, pass the House at an early date. It is the purpose of this bill to prevent the land sharks from dumping worthless land on prospective Michigan settlers and thus giving Michigan real estate a black eye.

Farmers Defeat Full-Crew Bill

Farm organizations were, no doubt, largely responsible for the defeat in the Senate of the proposed full crew railway bill. This measure would require an additional flag man on certain specified trains and would set a visious precendent whereby labor could dictate to the railroads in regard to their operating conditions. As long as we continue to make it harder for the railroads and increase their operating cost we cannot logically ask them for lower rates on farm products which we buy and sell.

For Cheaper Steel

At the request of the Michigan State Farm Bureau a resolution was passed by both Houses of the Legislature urging Congress and the Interstate Commerce Commission to take immediate steps to abolish the practice of selling all steel on the Pittsburgh Plus basis. Pittsburgh Plus it is explained is a shrewd practice of those engaged in steel manufacture of selling all rolled steel on the Pittsburgh price, plus the freight from Pittsburgh to point of delivery. Michigan steel, it must be remembered, comes largely from Gary and South Chicago where it can be manufactured much more cheaply than at Pittsburgh. Despite this fact we must pay the higher Pittsburgh price and the phantom freight all the way from Pittsburgh.

Filled Milk Bill a Law

Another bill which was also prepared and sponsored by the State Farm Bureau would prevent the manufacturer and sale within the state of "filled milk," milk from which the butter fat has been wholly or partily removed and replaced with a vegetable oil. This bill has already become a law, having passed both Houses and having been signed by the Governor.

Enactment of this measure at this time is regarded as most timely because Michigan Farm Bureau officials discovered that filled milk manufacturing companies which had been outlawed in other states were planning to move their machinery and equipment to Michigan. Filled milk is not a healthful product and does not contain the necessary vitamines to make a good food for children so the passage of this law not only benefits farmers and dairymen but city dwellers as well.

Eastern Time Defeated

After considerable debate the House of Representatives defeated the bill which would make eastern time the standard time for Michigan. This proposal had quite general opposition among the rural districts who feel that they get up early enough as it is without turning the clcok ahead. Fruit and produce growers and dairymen have especially hostile to the faster time. If the city people want to go to work a little earlier in the morning the farmers will be perfectly willing.

Standardization Bills Pending

In an effort to standardize Michigan farm products and increase their demand on the big markets, several bills have been passed setting up definite state standards and grades and requiring honest labeling, in order that the consumer may know what he is purchasing.

A bill has already been passed and become a law which sets up fat and moisture content standards for cheese and requires honest labeling. perhaps with this law we may win back some of the trade which Wisconsin, with its standardized and guaranteed cheese has won from us during the past few years.

At the request of the grape growers, a bill has been passed setting up three standard grades of grapes sold in closed packages within the state. An amendment to the apple standards bill is now being considered.

There is some prospect that Michigan may take the lead in the adoption of a state truth-in-fabric law. Wyoming passed such an act two years ago and has found it very successful. State legislatures in several other states now have similar measures under consideration.

Even the friends of this proposal are agreed that a federal law would be preferable to a state act, but they point out that Michigan had a state pure food law 15 years before the federal enactment was secured. Rep. Sanson of Caro has a very conservative and workable state truth-in-fabric bill which he has succesfully piloted through the House committee of the whole. His bill is now up for final passage on third reading by that body.

Through fair and unprejudiced legislative news sent out by Michigan State Farm Bureau to all of the weekly papers of the state the residents of rural districts have been kept better informed on legislative issues than ever before. Perhaps this knowledge on the part of the folks back home regarding just what sort of representation they were getting and what important issues affecting agriculture were pending has had something to do with the enactment of this beneficial agricultural legislation.

Many important bills effecting the farmer still await final passage and it would be well worth the time of any rural citizen to watch closely what takes place during the next two weeks. Let your Senator and Representative know what you think about these issues. He is there to carry out your wishes. That's what you sent him there for.

FARM BUREAU SEED DEPT. OPENS DETROIT OFFICE

THE Michigan State Farm Bureau has established a branch office of the Seed Department on the Eastern Market at Detroit, in connection with the Produce Exchange at 2729 Russell street. The Detroit branch will carry Michigan adapted western Grimm and Idaho alfalfas' hardy northern-grown clovers and legumes, grain, timothy and grass seeds.

FROM THE OLD TO THE NEW

A SERMON BY REV. DAVID F. WARNER

BIBLE TEXT—II Cor. 5:17.

"Old things are passed away, behold they have become new."

AT once, this will seem like a sweeping, revolutionary statement. But it is. It carries with it a revolutionary spirit and law. It gets clear entirely of past tradition. Paul poses as an ardent reformer who is crying, "Down with the past." It sounds like the cry of the Bolsheviki. It seems to say there is nothing good in old beliefs and ways; we must strike out entirely on new paths.

Now, because of this new temper in Christ's teaching, Christianity was looked upon as a class movement by some. Why? Because of the promise of social redemption and political release. It piqued the church leaders because of its seeming favoritism and its breaking down of a conventional and unsocial religion; and rulers tried to crush it, because, they said, it subverted all good government.

But did Paul have reference to sudden revolution in church and state? No. Discerning readers of the apostle know that he refers to a spiritual revolution in the individual; and thru this individual, to a new and reconciled society. He is summoning an inner and true estimate of things and values. He is saying we need a new look upon life, and not according to worldly estimates. According to Moffat, he is emphasising, not "externals," but "inward reality." Said Livingston, "I will place no value on anything I have or may possess except in relation to the Kingdom of God." Livingston demonstrated the reality of this Pauline doctrine. Have you? The annauls of history are filled with the names of those who caught this new thing; this new way of life. "Is your name written there?" And many, to have their old life merge into the new, must pay the martyr's price. How much are you paying?

From now on, says Paul, I know Christ no longer after the flesh, after externals; but in inner consciousness. The historical Christ had become the spiritual, abiding Christ. "It is no longer I that live, but Christ that liveth in me." This Pharisee, "as touching the law," became a mystic, as touching the spirit, Life no longer consisted in forms, rituals, ordinances, and sense matters. The apostle demonstrated in his own life the truth that, "If any man be in Christ" he has passed out of these into the new, creative things of the spirit. And it ought to be said here, that nothing in the church today, so hurts its progress as the mechanical theory of salvation and arbitrariness as to its ordinance life. It cuts the nerve of stewardship and is blighting to the spirit of unity. Here is where we may well pray that this old, unreasoning, uncharitable, spirit may pass away. Yet, for most of us, there is something fine and beautiful and necessary in symbol worship. Only, let us be charitable about externals.

Old things have been made into new. This is the divine way. It is the law of transformation, not destruction. We find it illustrated in Creation; in the scientific law of matter and energy; in the vegetable kingdom where the old seed becomes the new grain; and in the law of the resurrection which give us a new body out of the old.

And so, there shall be "a new heaven and a new earth." Not thru destruction or annihilation, but thru transformation. This new earth is to be filled with transformed individuals. Faith will have the world getting continually newer and freer. Life is full of promise and good in proportion as we accept the spiritual companionship of Christ; the saving mission of the church; and the new, moral push in the doings of men. Said a friend and bank president to me, "There is a place for everyone to grab hold." This is true since new and brotherly plans are engaging the thoughts of men. A great moral revolution is on and I am sure it is the spirit of the lowly Nazarene that has filtered down thru the centuries.

Do you see? Old things becoming new in Christ is the law of Christian progress. It provides for change and growth. It would not try to maintain old, wornout opinions and allegiances and try to galvanize them into new life. But would adapt the principle in new methods and loyalties to meet changes and customs in human life. Just this is the secret of growth in a religion that was dedicated by Christ to the universal man. And at this writing we have no better evidence of this in the church realm, than a change of front on the part of foreign missionaries, relative to the demands of a western denominationalism of the natives of the Orient. Good, virtue, love, light, faith—these do not change but they take new forms.

And this is the testimony of history. The Jewish nation passed away, but not her witness to the true God. Imperial Rome fell, but not her witness to the necessity of law and order. Similarly, we are beholding world changes in our day. Governments are being made over into new forms. God is working thru it all that the old may become new.

And who cannot trace the operation of this law in science and invention. What startling achievement by man in our own day thru a co-working with God's laws. "For thou hast made him (man) but little lower than God, and crownest him with glory and honor." All hail THE MAN! And may his transfigured followers soon come into their promised dominion. Even now, "The meek shall inherit the earth." They may pass from the old to the new.

But again, we have the witness of the church to this new creation. For the sin of Adam, God did not destroy the race. But out of a fallen, perverted, human nature he provided for a converted nature. He took a man of flesh (Jesus) and made him the groundwork of a new man. Man, which fell in the first Adam was made new in the second Adam. God came to our earth in man, and not to destroy, but to fulfil; to perfect and make complete. The Jewish temple, rites and practices were established by God only as parenthetical provisions in the process of developing this new creature. Their meaning is perpetuated in the man, Jesus. Hence we are not come unto the old Sinai but unto the new Sinai; "unto Mount Zion, and unto the city of the living God, * * * * to the spirits of just men made perfect, and to Jesus, the mediator of a new covenant."

The old perishing world is passing, friend. And where do you stand? A recent magazine says, "We are on the very threshold of a new age. The dates are unimportant, for in the advance of the plan of the ages it is not the sharp-cut dates, but periods of time, that are important. Old things pass away in a fading out process; new things gradually dawn. Only on looking backward do the people usually realize that "a great thing took place back there. Surprisingly few of the real turning points of the world come amid signs and wonders and people standing in awe of what is passing. In the minds of most, the War was THE cataclysm, because it was noisy; but something greater than the War, tho much less clamorous, is in passage now."

Jenny Lind, after discovering her power as a singer, was given a new outlook on life. She said, "I got up that morning one creature and went to bed another." A good, Christian woman said to me "I have passed out of bondage into liberty." These are free testimonies to a new creation. Verily, we are given a new standing before God. My Father is near when I know the love and sympathy and attention he bestows upon Christ he bestows upon me. Judgment is gone. Gloom, suspicion, and doubt are passed away. And when, men, everywhere, will give "conscious allegiance" to the new, creative power of Christ; when they are ready to line up with Christian duty and brotherhood obligations; then, "old things are passed away; behold they are become new." Then will have come to pass the Patmos dream, "I saw a new heaven and a new earth, for the first heaven and the first earth are passed away."

AN OMMISSION

The article "Preventing the Potato Landslide" which appeared in our March 31st issue was published through the courtesy of Farm, Stock and Home. It was through error that credit was not given to this publication.

12,000 People Killed By Automobiles in 1922

Automobile Insurance now a Necessity

More than 12,000 persons were killed by automobiles in 1922. 1,347 children are victims in 78 cities of more than 50,000 population. Pedestrians should use greater care, parents should guard the lives of their children, and automobile owners should drive carefully and keep insured.

The Citizens' Mutual pays about 300 claims each month, amounting to about 30,000. With the heavy traffic on all highways and in the cities, accidents are very frequent. The Company is enjoying a greatly increased business for 1923 because:

1st. The company has had nine seasons of experience.

2nd. It has settled over 12,000 claims.

3rd. It has assets on April 17 of over $258,000.

4th. Every policy carries $5,000 of liability and up to date the policy has been sufficient to take care of every claim.

5th. It has carried insurance for many years for Ex-Governor Rich, Ex-Governor Warner, a number of Circuit Judges, and State and County officers in nearly every part of the state.

The rate is very light in comparison with the stock insurance rates. Insure today; tomorrow may be too late. See our local agent.

The Hunted Woman

By James Oliver Curwood

Michigan's Own and America's Formost Author of the Great Northwest

(Copyright by James Oliver Curwood

(Continued from April 14th Issue)

“John—John Aldous——”

“Joanne! Oh, my God—Joanne!”

She swayed as he sprang to her, but she was smiling—smiling in that new and wonderful way as her arms reached out to him, and the words he heard her say came low and sobbing:

“John—John, if you want to, now—you can tell me that my hair is beautiful!”

And she was in his arms, her warm, sweet body crushed close to him, her face lifted to him, her soft hands stroking his face, and over and over again she was speaking his name while from out of his soul there rushed forth the mighty flood of his great love; and he held her there, forgetful of time now, forgetful of death itself; and he kissed her tender lips, her hair, her eyes—conscious only that in the hour of death he had found life, that her hands were stroking his face, and caressing his hair, and that over and over again she was whispering sobbingly his name, and that she loved him. The pressure of her hands against his breast at last made him free her. And now, truly, she was glorious. For the triumph of love had overridden the despair of death, and her face was flooded with its colour and in her eyes was its glory.

And then, as they stood there a step between them, there came—almost like the benediction of a cathedral bell—the soft, low tinkling chime of the half-hour bell in Aldous' watch!

It struck him like a blow. Every muscle in him became like rigid iron, and his torn hands clenched tightly at his sides.

“Joanne—Joanne, it is impossible!” he cried huskily, and he had her close in his arms again, even as her face was whitening in the lantern-glow. “I have lived for you, I have waited for you—all these years you have been coming, coming, coming to me—and now that you are mine—mine—it is impossible! It cannot happen——”

He freed her again, and caught up a lantern. Foot by foot he examined the packed tunnel. It was solid—not a crevice or a break through might have traveled the sound of a voice or the explosion of a gun. He did not shout. He knew that it would be hopeless, and that his voice would be terrifying in that sepulchral tomb. Was it possible that here might be some other opening—a possible exit—in that mountain wall? With the lantern in his hand he searched. There was no break. He came back to Joanne. She was standing where he had left her. And suddenly, as he looked at her, all fear went out of him, and he put down the lantern and went to her.

“Joanne,” he whispered, holding her two hands against his breast, “you are not afraid?”

“And you know——”

“Yes, I know,” and she leaned forward so that her head lay partly upon his breast.

“And you love me, Joanne?”

“As I never dreamed that I should love a man, John Aldous,” she whispered.

“And yet it has been but two days——”

“And I have lived an eternity,” he heard her lips speak softly.

“You would be my wife?”

“Yes.”

“Tomorrow?”

“If you wanted me then, John.”

“I thank God,” he breathed in her hair. “And you would come to me without reservation, Joanne, trusting me, believing in me—you would come to me body, and heart, and soul?”

“In all those ways—yes.”

“I thank God,” he breathed again. He raised her face. He looked deep into her eyes, and the glory of her love grew in them, and her lips trembled as she lifted them ever so little for him to kiss.

“Oh, I was happy—so happy,” she whispered, putting her hands to his face. “John, I knew that you loved me, and oh! I was fighting so hard to keep myself from letting you know how happy it made me. And here, I was afraid you wouldn't tell me—before it happened. And John—John——”

She leaned back from him, and her white hands moved like swift shadows in her hair, and then, suddenly, it billowed about her—her glorious hair—covering her from crown to hip; and with her hands she swept and piled the lustrous masses of it over him until his face, and head, and shoulders were buried in the flaming sheen and sweet perfume of it.

He strained her closer. Through the warm richness of her tresses his lips pressed her lips, and they ceased to breathe. And up to their ears, pounding through that enveloping shroud of her hair came the tick-tick-tick of the watch in his pocket.

“Joanne,” he whispered.

“Yes, John.”

“You are not afraid of—death?”

“No, not when you are holding me like this, John.”

He still clasped her hands, and a sweet smile crept over her lips.

“Even now you are splendid,” she said. “Oh, I would have you that way, my John!”

Again they stood up in the unsteady glow of the lanterns.

“What time is it?” she asked.

He drew out his watch, and as they both looked his blood ran cold.

“Twelve minutes,” she murmured, and there was not a quiver in her voice. “Let us sit down, John—you on this box, and I on the floor, at your feet—like this.”

He seated himself on the box, and Joanne nestled herself at his knees, her hands clasped in his.

“I think, John,” she said softly, “that very, very often we would have visited like this—you and I—in the evening.”

A lump choked him, and he could not answer.

“I would very often have perched myself at your feet like this.”

“Yes, yes, my beloved.”

“And you would always have told me how beautiful my hair was—always. You would not have forgotten that, John—or have grown tired?”

“No, no—never!”

His arms were about her. He was drawing her closer.

“And we would have had beautiful times together, John—writing, and going adventuring, and—and——”

He felt her trembling, throbbing, and her arms tightened about him.

And now, again up through the smother of her hair, came the tick-tick-tick of his watch.

He felt her fumbling at his watch pocket, and in a moment she was holding the timepiece between them, so that the light of the lantern fell on the face of it.

“It is three minutes of four, John.”

The watch slipped from her fingers, and now she drew herself up so that her arms were about his neck, and their faces touched.

“Dear John, you love me?”

“So much that even now, in the face of death, I am happy,” he whispered. “Joanne, sweetheart, we are not going to be separated. We are going—together. Through all eternity it must be like this—you and I, together. Little girl, wind your hair about me—tight!”

“There—and there—and there, John! I have tied you to me, and you are buried in it! Kiss me John——”

And then the wild terrible fear of a great loneliness swept through him. For Joanne's voice had died away in a whispering breath, and the lips he kissed did not kiss him back, and her body lay heavy, heavy, heavy in his arms. Yet in his loneliness he thanked God for bringing her oblivion in these last moments, and with his face crushed to hers he waited. For he knew that it was no longer a matter of minutes, but of seconds, and in those seconds he prayed, until up through the warm smother of her hair—with the clearness of a tolling bell—came the sound of the little gong in his watch striking the Hour of Four!

In space other worlds might have crumbled into ruin; on earth the stories of empires might have been written and the lives of men grown old in those first century-long seconds in which John Aldous held his breath and waited after the chiming of the hour-bell in the watch on the cavern floor. How long he waited he did not know; how closely he was crushing Joanne to his breast he did not realize. Seconds, minutes, and other minutes—and his brain ran red in dumb, silent madness. And the watch! It ticked, ticked, ticked! It was like a hammer.

He had heard the sound of it first coming up through her hair. But it was not in her hair now. It was over him, about him—it was no longer a ticking, but a throb, a steady, jarring, beating throb. It grew louder, and the air stirred with it. He lifted his head. With the eyes of a madman he stared—and listened. His arms relaxed from about Joanne, and she slopped crumpled and lifeless to the floor. He stared—and that steady beat-beat-beat—a hundred times louder than the ticking of a watch—pounded in his brain. Was he mad? He staggered to the choked mouth of the tunnel, and then there fell shout upon shout, and shriek upon shriek from his lips, and twice, like a madman now, he ran back to Joanne and caught her up in his arms, calling and sobbing her name, and then shouting—and calling her name again. She moved; her eyes opened, and like one gazing upon the spirit of the dead she looked into the face of John Aldous, a madman's face in the lantern-glow.

“John—John——”

She put up her hands, and with a cry he ran with her in his arms to the choked tunnel.

“Listen! Listen!” he cried wildly. “Dear God in Heaven, Joanne—can you hear them? It's Blackton—and his men! Hear—hear the rock-hammers smashing! Joanne—Joanne—we are saved!”

She did not sense him. She swayed, half on her feet, half in his arms, as consciousness and reason returned to her. Dazedly her hands went to his face in their old, sweet way. Aldous saw her struggling to understand—to comprehend; and he kissed her soft upturned lips, fighting back the excitement that made him want to raise his voice again in wild and joyous shouting.

“It is Blackton!” he said over and over again. “It is Blackton and his men! Listen!—you can hear their picks and the pounding of their rock-hammers!”

CHAPTER XX

AT LAST Joanne realized that the explosion was not to come, that Blackton and his men were working to save them. And now, as she listened with him, her breath began to come in sobbing excitement between her lips—for there was no mistaking that sound, that steady beat-beat-beat that came from beyond the cavern wall and seemed to set strange tremors stirring in the air about their ears. For a few moments they stood stunned and silent, as if not yet quite fully comprehending that they had come from out of the pit of death, and that men were fighting for their rescue. They asked themselves no questions—why the “coyote” had not been fired? How those outside knew they were in the cavern. And, as they listened, there came to them a voice. It was faint, so faint that it seemed to whisper to them through miles and miles of space—yet they knew that it was a voice!

“Some one is shouting,” spoke Aldous tensely. “Joanne, my darling, stand around the face of the wall so flying rock will not strike you and I will answer with my pistol!”

When he had placed her in safety from split lead and rock chips, he drew his automatic and fired it close up against the choked tunnel. He fired five times, steadily, counting three between each shot, and then he placed his ear to the mass of stone and earth and listened. Joanne slipped to him like a shadow. Her hand sought his, and they held their breaths. They no longer heard sounds—nothing but the crumbling and falling of dust and pebbles where the bullets had struck, and their own heart-beats. The picks and rock-hammers had ceased.

Tighter and tighter grew the clasp of Joanne's fingers, and a terrible thought flashed into John's brain. Perhaps a rock from the slide had cut a wire, and they had found the wire—had repaired it! Was that thought in Joanne's mind, too? Her finger-nails pricked his flesh. He looked at her. Her eyes were closed, and her lips were tense and gray. And then her eyes shot open—wide and staring. They heard, faintly though it came to them—once, twice, three times, four, five—the firing of a gun!

John Aldous straightened, and a great breath fell from his lips.

“Five times!” he said. “It is an answer. There is no longer doubt.”

He was holding out his arms to her, and she came into them with a choking cry; and now she sobbed like a little child with her head against his breast, and for many minutes he held her close kissing her wet face, and her damp hair, and her quivering lips, while the beat of the picks and the crash of the rock-hammers came steadily nearer.

Where those picks and rock-hammers fell a score of men were working like fiends: Blackton his arms stripped to the shoulders; Gregg, sweating and urging the men; and among them—lifting and tearing at the rock like a madman—old Donald MacDonald, his shirt open, his great hands bleeding, his hair and beard tossing about him in the wind. Behind them, her hands clasped to her breast—crying out to them to hurry, hurry—stood Peggy Blackton. The strength of five men was in every pair of arms. Huge boulders were rolled back. Men pawed earth and shale with their naked hands. Rock-hammers fell with blows that would have cracked the heart of a granite obelisk. Half an hour — three quarters — and Blackton came back to where Peggy was standing, his face black and grimed, his arms red-scared where the edges of the rocks had caught them, his eyes shining.

“We're almost there, Peggy,” he panted. “Another five minutes and——”

A shout interrupted him. A cloud of dust rolled out of the mouth of the tunnel, and into that dust rushed half a dozen men led by old Donald. Before the dust had settled they began to reappear, and with a shrill screan Peggy Blackton darted forward and flung her arms about the gold-shrouded figure of Joanne, swaying and laughing and sobbing in the sunshine. And old Donald,

---

THE LATE SPRING

Oh, day in month of April,
Like the month of March much more,
For so cold the wind is blowing
It prevents the open door.

Your looks almost deceive me,
As sitting in this chair
The sun's rays thru the window
Make you appear quite fair.

The fleecy clouds of white
Sailing in a lovely blue,
With the sunshine coming in between
Speak very well of you.

But frost is in the ground
And how can grasses grow
In places which this morning
Were cold with sullen snow.

The heavy wraps are with us yet,
And stoves and coal pails tell
That winter still is quite alive,
Tho we have sung his knell.

Where are the soft and balmy winds
To warm and cheer our soul,
And where the birds whose melodies
From out their throats should roll?

Did not we hear a robin
About a month ago,
Tell us spring was coming,
Why does it tarry so?

And yet, Oh day in April,
Tho cold and bleak you are,
We're very thankful for you—
It could be worse, by far.

—By Parm Mayer

clasping his great arms about Aldous, cried brokenly:

"Oh, Johnny, Johnny—something told me to foller ye—an' I was just in time—just in time to see you go into the coyote!"

"God bless you, Mac!" said Aldous, and then Paul Blackton was wringing his hands, and one after another the others shook his hand, but Peggy Blackton was crying like a baby as she hugged Joanne in her arms.

"MacDonald came just in time," explained Blackton a moment later and he tried to speak steadily, and tried to smile. "Ten minutes more, and——"

He was white.

"Now that it has turned out like this I thank God that it happened," said Aldous, for the engineer's ears alone. "We thought we were facing death, and so—I told her. And in there, on our knees, we pledged ourselves man and wife. I want the minister—as quick as you can get him, Blackton. Don't say anything to Joanne, but bring him to the house right away, will you?"

"Within half an hour," replied Blackton. "There comes Tony with the buckboard. We'll hustle up to the house and I'll have the preacher there in a jiffy."

As they went to the wagon, Aldous looked about for MacDonald. He had disappeared. Requesting Gregg to hunt him up and send him to the bungalow, he climbed into the back seat, with Joanne between him and Peggy. Her little hand lay in his. Her fingers clung to him. But her hair hid her face, and on the other side of her Peggy Blackton was laughing and talking and crying by turns.

As they entered the bungalow, Aldous whispered to Joanne:

"Will you please go right to your room, dear? I want to say something to you—alone."

When she went up the stair, Peggy caught a signal from her husband. Aldous remained with them. In two minutes he told the bewildered and finally delighted Peggy what was going to happen, and as Blackton hustled out for the minister's house he followed Joanne. She had fastened her door behind her. He knocked. Slowly she opened it.

"John——"

"I have told them, dear," he whispered happily. "They understand. And, Joanne, Paul Blackton will be back in ten minutes—with the minister. Are you glad?"

She had opened the door wide, and he was holding out his arms to her again. For a moment she did not move, but stood there trembling a little, and deeper and sweeter grew the colour in her face, and tenderer the look in her eyes.

"I must brush my hair," she answered, as though she could think of no other words. "I—I must dress."

Laughing joyously, he went to her and gathered the soft masses of her hair in his hands, and piled it up in a glorious disarray about her face and head, holding it there, and still laughing into her eyes.

"Joanne, you are mine!"

"Unless I have been dreaming—I am, John Aldous!"

"Forever and forever."

"Yes, forever—and ever."

"And because I want the whole world to know, we are going to be married by a minister."

She was silent.

"And as my wife to be," he went on, his voice trembling with his happiness, "you must obey me!"

"I think that I shall, John."

"Then you will not brush your hair, and you will not change your dress, and you will not wash the dust from your face and that sweet little beauty-spot from the tip of your nose," he commanded, and now he drew her head close to him, so that he whispered, half in her hair: "Joanne, my darling, I want you wholly as you came to me there, when we thought we were going to die. It was there you promised to become my wife, and I want you as you were then—when the minister comes."

"John, I think I hear some one coming up the front steps!"

They listened. The door opened. They heard voices—Blackton's voice, Peggy's voice, and another voice—a man's voice.

Blackton's voice came up to them very distinctly.

"Mighty lucky, Peggy," he said. "Caught Mr. Wollaver just as he was passing the house. Where's——"

"Sh-h-hh!" came Peggy Blackton's sibilant whisper.

Joanne's hands had crept to John's face.

"I think," she said, "that it is the minister, John."

Her warm lips were near, and he kissed them.

"Come, Joanne. We will go down."

Hand in hand they went down the stair; and when the minister saw Joanne, covered in the tangle and glory of her hair; and when he saw John Aldous, with half-naked arms and blackened face; and when, with these things, he saw the wonderful joy shining in their eyes, he stood like one struck dumb at sight of a miracle descending out of the skies. For never had Joanne looked more beautiful than in this hour, and never had man looked more like entering into paradise than John Aldous.

Short and to the point was the little mountain minister's service, and when he had done he shook hands with them, and again he stared at them as they went back up the stair, still hand in hand. At her door they stopped. There were no words to speak now, as her heart lay against his heart, and her lips against his lips. And then, after those moments, she drew a little back, and there came suddenly that sweet, quivering, joyous play of her lips as she said:

"And now, my husband, may I dress my hair?"

"My hair," he corrected, and let her go from his arms.

Her door closed behind her. A little dizzily he turned to his room. His hand was on the knob when he heard her speak his name. She had reopened her door, and stood with something in her hand, which she was holding toward him. He went back, and she gave him a photograph.

"John, you will destroy this," she whispered. "It is his photograph—Mortimer FitzHugh's. I brought it to show people, that it migh help me in my search. Please—destroy it!"

He returned to his room and placed the photograph on his table. It was wrapped in thin paper, and suddenly there came upon him a most compelling desire to see what Mortimer FitzHugh had looked like in life. Joanne would not care. Perhaps it would be best for him to know.

He tore off the paper. And as he looked at the picture the hot blood in his veins ran cold. He stared—stared as if some wild and maddening joke was being played upon his faculties. A cry rose to his lips and broke in gasping breath, and about him the floor, the world itself, seemed slipping away from under his feet.

For the picture he held in his hand was the picture of Culver Rann!

Young Hopeless—"Yes, father—to be young and broke."—Punch Bowl.

Air-Cure Your Hay

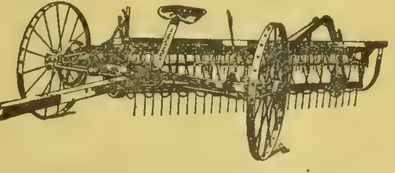
with McCormick-Deering Hay Tools

IT ISN'T sun-drying that puts quality into hay, but *air-curing.* And hay is air-cured best when side-tedded into light, breeze-sifting windrows such as those that trail off in the wake of the

McCormick-Deering Side Rake and Tedder

You can follow closely behind the mower with this machine and rake the hay before the leaves begin to wilt. The teeth strike the heads of the hay first and rake clean, picking up every last wisp—and there is no shattering of leaves. The hay is turned completely over and deposited in snug, airy windrows through which the air circulates freely, curing evenly both stems and leaves with its magic touch.

There are points of mechanical excellence that distinguish this fast-working, gentle hay-handling machine from all other types of side rakes and tedders. There are also many points of mechanical excellence that distinguish all hay machines made in the International Harvester factories—**McCormick, Deering and Milwaukee mowers, McCormick-Deering self-dump rakes, tedders, sweep rakes, stackers and loaders.** Ask your near-by McCormick-Deering dealer to show you.



McCormick-Deering Side Rake and Tedder

RELIABLE ADVERTISERS

We will not knowingly accept the advertising of any person or firm who we do not believe to be thoroughly honest and reliable. Should any reader have any cause for complaint against any advertiser in these columns, the publisher would appreciate an immediate letter bringing all facts to light. In every case when writing say: "I saw your advertisement in The Michigan Business Farmer!" It will guarantee honest dealing.

"The Farm Paper of Service"

FRED M. WARNER

THRICE governor of the state to which he had come an immigrant boy from England, beloved by thousands of men and women who knew him as "Fred" and went to him with their troubles, as children go to their parents for consolation, Fred M. Warner, passed away last week at the age of fifty-eight.

Only a few months ago we watched him throw every ounce of his energy into the campaign for United States senator, when contrary to the advice of his friends, and at the risk of his position as national committeeman, he backed a man who had in former years befriended him.

Fred Warner never forgot a friend and he made friends wherever his smile went. The farmers of Michigan never had a better friend than this man, because he was never entirely out of the farming business himself. He knew the farmers problems, but only recently he was heard to remark that things were not nearly so dark for the farmer as they appeared on the surface. He believed a better day for all farmers, and particularly for the dairy farmer, was not far distant and he repeated this optimism to many a worried farmer who came to him for advice during the past year or two.

From his old-fashioned home under the elms at Farmington, Fred M. Warner was taken to the little cemetery, that from the crest of a hill overlooks the town and the industries he helped to build. No more representative throng ever assembled in Michigan to pay its respects to a beloved and worthy citizen. Rich and famous men who came in liveried equipage, mingled with simple folk whose dusty footgear showed how they had come. From the home to the cemetery, the school-children of Farmington, joined hand in hand on either side of the roadway formed a guard of honor.

A fitting tribute to a noble man who served his state so well!

TOO MUCH IS ENOUGH

ONE of the formost agricultural journals in this country denounced last week most severely the policy employed by Secretary of Agriculture Wallace and his Department. It was stated in this editorial that running down the farmer's business was not going to help him reestablish himself. In other words, that the last thing you would tell the banker of whom you were trying to borrow money would be the discouraging side of your business. You would want to paint an optimistic picture, which would go to show that in the near future your business would be on a sound foundation, and you would be back in a position to repay the loan he was making you.

There can be no question but what the airing of the farmer's demoralized financial condition has reduced by a great many millions of dollars the value of the farms in this country. The price of any commodity is set by the demand for it, and buyers are not going to clamor for a business which is reported to be in such bad shape as the farming business is.

Probably it is true that no single source of information has been so prolific in its output of this sort of publicity as has the Department of Agriculture.

However, Secretary Wallace is not to be hastily condemned because it is undoubtedly true that he was trying to prove to the lawmakers (then in session at Washington) that the situation was, as we know it to be, very serious, and that unless some changes were made and some relief offered the farmer, a serious catastrophe might result.

It is not clear to us how the Secretary could have made these facts known without making them public, and if he made them public than the farming business generall had to suffer the consequences.

Farmers as a whole may not be in as bad shape as has been painted. We have talked with many farmers in Michigan who had a satisfactory year in 1922. Satisfactory because they had already adjusted themselves to post-war conditions, knew that the change had to come, specialized in dairy or other cash crops, and were so fortunately situated that they were able to show a profit for the year. We readily grant that these are exceptions and that the average farmer in Michigan, as in other states, did not secure a satisfactory return from his material and his labor last year.

We do believe, however, that optimistic publicity given to the farming business at this time will aid in re-establishing conditions, and we believe that Secretary Wallace has in the Department of Agriculture, the most potent force through which this information may be broadcasted.

A DAIRYMAN'S QUESTIONS

"WHY is it," asks a Livingston county dairyman, "that the price of milk is cut during the months of March and April, two of the most expensive months in which to produce milk, when it is sold to the consumer at the same price as January milk?"

That sounds like a perfectly fair and reasonable question and one which we trust Dr. Friday will include in his present study of the milk marketing conditions in Michigan and particularly in the Detroit area.

This same inquiring dairyman who is not afraid to ask publicly some of the questions which come to him while he is feeding his cows, wants to know why the price of milk is quoted at the terminal and not at the receiving station. Here are two subjects worthy of investigation and study.

We hope to publish the answers from the milk commission and Dr. Friday in our next issue and in addition perhaps some of our readers can throw further light on these or other dairymens questions. Inasmuch as the lid is off the milk-can, lets scrub-it, steam-it and thus steralize it inside and out. The Business Farmer has no intention of picking a fight, but we certainly will not stay out if we can help the milk producers and we are pretty sure we can!

FARM BUREAU AND LABOR DON'T HITCH

CLARK L. Brody, Secretary and Manager of the Michigan State Farm Bureau, had to lay down the law last week to the representatives of the labor unions who were trying to secure the passage of the Full-Crew bill, which he characterized as unwarranted, "because it added an unnecessary burden on the people of Michigan." It is said that the labor union representatives had promised their support of the income tax measure if the farm bureau would support the union Full-Crew bill.

Union labor and farm organizations, although theoretically similar, are in fact economically opposed to one another inasmuch as the farmer is a capitalist, and also an employer of labor.

The farmer knows that while he has been put through a period of deflation, the like of which is unparalleled in the history of this country, labor, thanks largely to their unions, has been able to maintain a standard of wages so much higher than the price of farm products that there is no comparison.

The farmer is interested in seeing labor well employed and efficient in its work, but when the hours of labor are cut down to a point where the mechanic is giving only a part of himself for a wage too high, then it is the farmer, as the largest consumer of manufactured products, who must pay for this lack of efficiency and extravagance.

Theorists and hair-brained economists are always trying to weld a link between union labor and farm organizations, but when it comes down to a show-down and the actual facts are weighed, it usually works out about as it did in the recent demonstration at our own state capitol.

POTATO GROWERS GET TOGETHER

THE silver lining of the black cloud which hovered over the potato growers has already come to the surface in the formation of a national potato growers' association, which will include the potato growers of all of Michigan, Maine, New York, and other potato growing states, and which will be operated on the same plan which has been so successfully used by the fruit growers of California, the cotton producers of the south, and the tobacco growers of Kentucky.

It is planned to operate a national sales agency with offices in the larger cities, and probably a direct control of the markets will be thus maintained. It is our opinion that the only way out of the present farm dilemma is the operation of farmer-owned selling agencies. It would seem that the success met by the co-operative marketing on this basis in other states has proved the efficiency of this plan, and we know of no better staple in which to extend the experiment than in potatoes. We certainly commend this plan to the potato growers of Michigan.

THE ROAD BUILDING PROBE

THE gasoline tax measure which went down to an inglorious defeat, thanks to the veto of Governor Groesbeck, focused the attention to the State Highway Department, for which the extra funds were found to be necessary.

Remarks were passed in the legislature which were not complimentary to the State Road Commissioner or to the work that has been accomplished. In answer to these charges, Commissioner Frank Rogers invited the Senate to make a thorough investigation of his department, all of its activities, and where its money had been spent, which was so commendable that his suggestion was promptly accepted.

It seems to be a pretty well-accepted idea not only from the farmer but from the tax-paying class in Michigan generally that some revision of the road building program must be made which will not call for an increase in taxes, except as they come directly from those who use the roads, which, luckily (?), today includes most of us.

The Business Farmer will be glad to place before the investigating committee any instances of apparent misuse of road building funds or any other conditions regarding the road building program which should be brought to their attention. We agree not to divulge the name of the sender, providing all of the facts as stated will bear investigation by us.

A SPRING TONIC

THE two days last week when the summer came back to give us a promise of what we might expect was a better "spring tonic" than all of the patent potions which we might accumulate from the apothecary.

There is one satisfaction which comes to us who live so far north and that is the contrast which comes in the spring of the year, after a stretch of winter which we sometimes think will never end.

There is a sensation which comes to the man who follows the plow in new turned earth on a day like this which cannot be compared with any similar experience in this old world of ours.

The farmer's wife and family too, can lift their hands to high Heaven and give some thanks when spring comes that they are not confined within the narrow walls and shut in by the clutter of buildings on all sides, as are the millions who live in cities.

Be glad you are alive this year, friends. Take an inventory of the things you have to be thankful for and it may go a long ways toward making up for the things you wish you had.

Try it, and you will have the best prescription we know of for a "Spring Tonic."

NAMING THE FARM

DID you ever stop to think as you drove along a country road that every farm looks alike except the one with a name on it. As a recent writer pointed out, there is exactly as much reason for naming your farm as naming your horse, your dog, or your cat, and yet you name them because you are fond of them and want to distinguish them from others of their kind.

A farm is just a farm, after all, unless it is named, and certainly it is not hard to select a name for something which is near and dear to you for a reason.

That lone pine, the orchard, the twin silo, the winding stream, the long view, the hill-crest, the old homestead; look about you and you will find a dozen subjects that might suitably name your farm and from these select the one that seems best to distinguish your farm from that of your neighborhood.

A new sense of proprietorship comes from the possession of a "named" farm, yet how simple it is to give your farm this distinction.

PUBLISHER'S DESK

MR. JONES OF OLNEY, ILLINOIS

THERE are so many folks with farms for sale these days that the farm land sharks are thicker than flies around a molasses barrel, if we are to believe the reports which we get.

We have told readers of the methods employed by the Warren-McRae Farm Agency of Logansport, Indiana, and recently we have had several inquiries regarding Jones, of Olney, Illinois, who has a very much different scheme, the efficiency of which we are not informed.

It is, we believe, Mr. Jones' plan to insert a description of your farm for sale in 'The Farm Buyers Guide', and the cash payment which he asks pays for this ad. At the same time the seller promises to pay a commission if the farm is sold through the advertisement thus inserted.

The scheme operated by Mr. Jones may be all right, and if any of our readers have had dealings with Mr. Jones, satisfactory or otherwise, I would be glad to hear from them, as the number of inquiries I have had leads me to believe this gentleman to be doing a considerable business in the state of Michigan.

It has been some time now since we have heard from any readers doing business with Warren McRae, Logansport, Indiana. Either he has withdrawn from the state of Michigan or Business Farmer readers are sufficiently warned so that we do not hear from them. I feel quite sure that he has cancelled his advertising in Michigan, and if any of our readers have had recent dealings with him of any kind, the publisher would be glad to hear from them.

SECOND-HAND AUTOMOBILES

Doping up old Lizzie
  and addin' a little paint,
Makes her run like sixty
  and look like what she ain't!

Let me warn my readers that prices on second-hand automobiles were never lower than they are today and I understand that Detroit street corner dealers are planning on driving into the country whole fleets of large and small used cars which might better be headed for the scrap-heap and foisting them off on farmers and small-town folks.

The great big seven passenger cars that weigh tons, and burn gasoline like a bonfire are the real drugs on the market. The agent who offers to sell you one of these ice-wagons may in truth tell you it cost $5,000 only three years ago and still he offers it to you for $500! He may not be lying, but the car will probably be a liability and a big one on your shoulders from the day you buy it.

Undoubtedly there are good used cars on the market, but if you insist on buying one, be sure you get it from a dealer you know and can trust, for buying and trading hosses in the old days was kindergarten work compared to the second-hand automobile business of today.

PAPERS THAT NEVER STOP

Many readers write to ask if they can be made to pay for a periodical which has been mailed by the publisher after the subscription paid for has expired.

Unfortunately we must reply "yes", for the law is that the publisher may assume that the subscriber has simply neglected to renew his subscription and the periodical may be mailed for one year from date of expiration and remuneration therefor collected.

Many publications make it a rule to stop on expiration of the subscription, this as often makes bad friends of the reader, as does the policy of continuing for one year, unless notified to discontinue.

A publication cannot collect more than one year in arrears, nor for any period after it has been notified by the subscriber to stop.

BUYING NURSERY STOCK

Don't buy nursery stock from a stranger! If you will paste that bit of advice up somewhere in your house you will save yourself some of the worries which many of my correspondents have sent in to me.

An agent, who has found it more profitable to carry a nursery order book and catalog, than do plain "tramping" can be sure of landing one or two suckers a day, out of a dozen calls. Usually he asks for half-cash down, the balance to be paid when trees are received. Sometimes however, when in a pinch, he will take 10% down or $1 on every $10 represented in the order.

When the deluded purchaser writes the "nursery company" he gets either a curt letter telling him they never heard of the agent in question or the letter is returned by the post-office marked "not known at this address".

If I were buying nursery stock I would want to know exactly the company I was buying from, how long they had been in business and then I would want to see the stock and examine it before I paid for it. The answer is in my opening sentence:

Don't buy nursery stock from a stranger!

MUTUAL FIRE INSURANCE

Mutual insurance societies are founded on a perfectly safe and economical system which has been in operation in all parts of the world and on all possible risks for many, many years. The success of a mutual depends however so much on the men in whose hands lie its destiny that all too often we hear of one leaving its members in the lurch with nothing but some worthless office fixtures and a big assessment to be paid.

Recently I have received more than one inquiry regarding a state mutual fire insurance company, which I have promptly turned over to the state insurance commissioner, thus through promptly bringing this company to the attention of the proper authorities, I may be able to save the farmer-members what might have otherwise been a most serious loss, not only to this, but to other mutuals in Michigan.

GETTING MONEY ON CHATTEL MORTGAGES

The Publisher is curious to learn if farmers throughout Michigan are unable to borrow money on chattel mortgage. In response to readers in the northern part of the state. an investigation was made and the bank frankly admitted that it was not in a position to accept chattel mortgage because it could not watch the collateral.

Apparently this brings us back exactly were we started in the matter of extending credit, if the renting farmer cannot secure a small loan covering a period in which he is pressed for money, it leaves the rentor and the tenant entirely at the mercy of the money grabber, and makes it doubly hard for him under present-day farming conditions.

AMERICAN HORTICULTURAL COMPANY, DES MOINES, IA.

WE have several claims pending against this concern; all of them are small, but we have net been able to secure a satisfactory settlement for our readers. Last year this company sent out vouchers which were to be accepted this year as cash, but a reader informs us that after sending the voucher in she has had no reply from the company. We are doing our best to secure satisfaction for our many readers

The Collection Box

The purpose of this department is to protect our subscribers from fraudulent dealings or unfair treatment by persons or concerns at a distance.

In every case we will do our best to make a satisfactory settlement or force action, for which no charge for our services will ever be made, providing:

1.—The claim is made by a paid-up subscriber to The Business Farmer.

2.—The claim is not more than 6 mos. old.

3.—The claim is not local or between people within easy distance of one another. These should be settled at first hand and not attempted by mail.

Address all letters, giving full particulars, amounts, dates, etc., enclosing also your address label from the front cover of any issue to prove that you are a paid-up subscriber.

Rheumatism

A Remarkable Home Treatment Given by One Who Had It

In the year 1893 I was attacked by Muscular and Sub-Acute Rheumatism. I suffered as only those who are thus afflicted know for over three years. I tried remedy after remedy, but such relief as I obtained was only temporary. Finally, I found a treatment that cured me completely and such a pitiful condition has never returned. I have given it to a number who were terribly afflicted, even bedridden, some of them seventy to eighty years old, and the results were the same as in my own case.

I want every sufferer from any form of muscular and sub-acute (swelling at the joints) rheumatism, to try the great value of my improved "Home Treatment" for its remarkable healing power. Don't send a cent; simply mail your name and address, and I will send it free to try. After you have used it, and it has proven itself to be that long-looked for means of getting rid of such forms of rheumatism, you may send the price of it, One Dollar, but understand I do not want your money unless you are perfectly satisfied to send it. Isn't that fair? Why suffer any longer, when relief is thus offered you free. Don't delay. Write today.

What the Neighbors Say

PALS ON A 50-50 BASIS

WE are retired farmers now, but we hold a hearty interest in the farmers and we enjoy the M. B. F. and feel that it is doing a great service to all. Long may it live and prosper.

Some time ago on "What the Neighbors Say" page, there was an interesting article from Mrs. R. B., Ohio, on "Personal Freedom" of which, it would seem, she is completely deprived of. I hoped some capable writer would defend her, for, unfortunately, there are many wives who suffer practically the humiliation and in your issue of March 17th comes a splendid article of defence from "Molly Brown" I am am just bubbling over to add a few words of support.

If there were more women like Molly Brown there would be fewer men like Mr. R. B. and the world would be better for it.

Good for you Molly, you have loyally championed a just cause. The marriage license doesn't rob either party of their personal rights and privileges and there should be equality, co-operation and a kindly unselfish consideration, each for the rights and comforts of the other.

The average wife puts in as many weary hours of toil as the husband and she is justly entitled to a fair share of the profits. If not, why not? The husband doesn't oblige his hired help to ask for their wages Then why should the wife have to ask for money? Doesn't she earn it? If the head of the house thinks she doesn't, just let him hire some one to fill her place for a while and it want take long to convince him that he will pay far more for inferior services.

A generous husband, and there are many of them, too, will give his wife an allowance according to his means and spare her the humiliation of having to ask for every dollar she wants and then probably be expected to tell what she wants it for. Ye Gods! That is enough to fill the heart of a proud woman, with scorn and contempt rather than love and devotion. But it has been said that a woman can dig her own grave and step down into it behind the look and the smile and the duty she gives her husband and it may be years before he finds it out. However, I question her wisdom or if he would love her better for it. For with man its the unatainable that is the most desirable. Come on, Uncle Rube, let us hear from you on this subject.—Sincere Subscriber, Caro, Mich.

WHAT IS WRONG WITH FARMING?

THERE is much uneasiness and more or less dissatisfaction, because the farmers' products as a whole have not advanced in price as rapidly as other commodities. It is a fact that cotton and wool have advanced more rapidly than the average of the commodities, in which advance the farmer should participate if he does his marketing wisely. Not only the cotton growers and wool growers, but the growers of citrus fruits, vegetables, raisins and apples and dairymen, etc., have very greatly improved their margin of profits through marketing associations. What is known as the "dirt farmer" or the raiser of potatoes, corn, wheat, etc., are the ones who are most badly hit and who are lacking in marketing organizations. In fact, they are the victims of organization on the part of others.

It is reasonable to say that the export market for American grains is cut off and will be so for many months, if not years, to come on account of the inability of foreign countries to pay the debts they have already contracted, to say nothing of their ability to pay for new commitments.

It is acknowledged that we raise more grain than our domestic market will consume. It seems that there is only one way to provide for the consumption of the surplus, inasmuch as that surplus cannot be sold abroad, and that way is to increase the home market. Inasmuch as we cannot send our surplus to the foreigner, we can bring the foreigner to our surplus. Heretofore, the population of our country has grown rapidly and the increase in population has required a very considerable increase in the amount of farm products. On account of the immigration laws recently passed by congress at the request and in the interest of the labor unions, the flow of immigrants to this country has been cut down to the minimum. If a considerably larger number of immigrants were admitted it would result in the larger consumption of farm products at home and would also furnish larger supply of farm labor.

The writer of this article is a nursery man and finds it necessary to pay sixty cents per hour for good help in the nursery. He can secure common labor for forty cents per hour, but it is cheaper to pay sixty cents for good efficient help. The difficulty in securing farm labor and its extraordinary high cost together with its average inefficiency, is due to the scarcity of labor caused by the law mentioned above. Farmers are obliged to hire and put up with the inefficient labor that is discarded by the manufacturers, who are obliged to offer extraordinary inducements in the way of wages to secure help enough in a very much depleted labor market. The manufacturers can pay higher wages and get their choice of labor, the inefficient surplus going to make up the supply of farm labor with which the farmer must be content. There was a time when high grade Irish, English, German, Dutch, and other skilled farmers immigrated to this country in considerable numbers. They are prevented from coming at this time on account of the law restricting immigration and particularly on account of the "contract labor" law both of which were enacted at the request of the American Labor Unions and are at the expense of the American farmer.

It does not take a farmer long to figure out and appreciate that an increase in the number of foreign immigrants would very quickly increase the domestic demand for his farm products and would furnish a materially larger supply of help, and would result in a more efficient grade of farm laborers. Neither would it take a farmer long to figure out that if his home market was increased and his cost of production from the increase of farm labor were reduced, that his margins of profit would at once be increased with the result of materially changing status of the farmers' bank account.

There is another angle that the farmer should consider, namely, that increased immigration would reduce not only the farmers' cost of production, but would reduce the cost of producing the various products that the farmer is obliged to buy. The cost of these manufactured products is greatly increased by the restricted labor supply as it exists under the present law. We would, therefore, see this happy condition, that the farmers' income and margin of net profits would be materially increased at the same time and the cost of the farmers' purchases would likewise be materially decreased. This point could be elaborated, but it seems so clear to the writer that it seems unnecessary to dwell upon it further. There is, however, another thought in connection with this, and that is that after the farmer has produced his crops at the minimum cost he has yet to transport them to his market. The American Federation of Labor has seen to it that the cost of moving the farmers' crops should be at a maximum rather than a minimum, due to labor shortage and to increase of costs due to higher wages and diminished efficiency, all due to labor union conditions.

It is not the intention of this article to take up matters in relation to politics, but there is one point in which the farmer is vitally interested, and that is that he should not allow himself to be made the cat's paw to rake chestnuts out of the fire for the labor unions. The labor unions are directed and engineered by very able and shrewd men at the head of whom is Mr. Gompers, and anyone who thinks Mr. Gompers is asleep at the switch is mistaken. Labor unions have been trying to get the farmers to join with them politically, and it seems almost a foregone conclusion that such a union of labor with us farmers would be engineered largely through Federation of Labor headquarters. We need mention only one instance and that a very recent one as follows:

Last summer there was a strike on the railroads to prevent the reduction of wages and the consequent reduction of freights. The result of this strike was that rolling stock including both cars and engines were largely relegated to the bad order yards when the labor unions had gained their end of maintaining high wages (and they are the highest paid of all labor). The rolling stock was in bad order, and the farmers' crops were ready to be moved to market. What was the result? It was impossible to move a large per cent of the perishable crops, including fruits and vegetables with the result that the farmer lost his crop and his year's work. In other words, the farmer held the bag while the labor union came through with undiminished wages. The writer may be a poor judge of conditions, but it seems to him that in nearly every case, the farmer foots the bill and the labor union absorbs the profit.

Please excuse discretion, which may seem to be a political one and let us return to the question of immigration. With the very restricted labor market, due to the law afore-mentioned, it is the easiest thing in the world through strikes, for any union to force an increase in wages. This statement hardly needs to be elaborated. There is only one thought in this connection and that is that in England the farm laborers have organized and there is a farm laborer's strike in progress in that country. The question before us farmers at this time is this: With the very much decreased immigration and restricted labor, how long will it take for us to get into the same condition that they are now in, in England and be up against the farm hands' union with greatly increased wages?

The writer has only attempted herein to make a few suggestions which might be greatly simplified and in that way clarified and made forcible. The writer has simply tried to lay before other farmers what seems to him to be the cause of our trouble and to suggest that we cannot too quickly ask for relief in the shape of a repeal of the law which creates for us unnecessary hardship in view of the fact that the farmer in the end has to carry the burden of all increases in costs in all of the industries.

If farmers would promptly write to their senator and representative in congress and insists upon less restriction of immigration, I am sure would greatly help the situation and in the end would materially increase the net profits of their farming operations. Let us take some action along this line and do it promptly.—Harry S., Cooper, Wisconsin.

VOTERS DISFRANCHISED BY SMOKE

AT our April 2nd town meeting I noticed several "prominent townsmen" smoking—some almost continuously during meeting. A certain man being remonstrated with, said "any person that did not like tobacco smoke should not come to the town hall," he would smoke anyway.

Not even the women voters present were asked if they enjoyed ar appreciated tobacco smoke second handed. It appeared as if all those citizens male or female, who had not formed the habit of smoking were to be smoked out and thus disfranchised.

Let us suppose a parallel case. Some person builds a few small fires of old rags and chips in the hall. Would these same gentlemen smokers stand for it? Not for a minute.

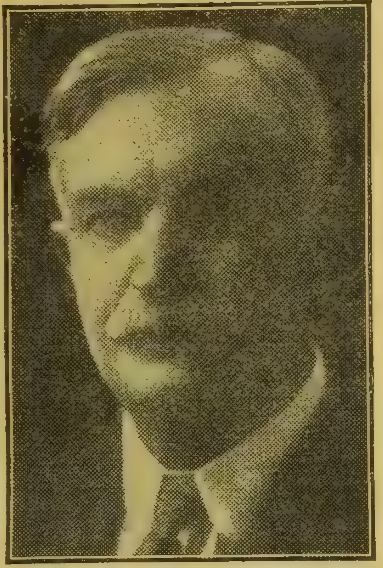
As I heard a lady say "While so much is being said about health measures—all people should by state law be protected in their natural rights to assemble in public halls, with pure invigorating air free from smoke."

I fully acknowledge the right of the smoker to isolate himself from the public and smoke to his heart's content. However, when in public places, the right of the public to free, unpoluted air, is first. Will some reader kindly suggest the remedy?—A subscriber, Almo, Mich.

Warner's Life an Inspiration

Fred M. Warner, Three Times Governor of Michigan, Rose to Prominence in Spite of Great Difficulties

By JOHN FITZGIBBON



FRED M. WARNER
(Born 1865—Died 1923)

THE son of an English immigrant who was so poor that, dying when the boy was seven years old, the mother gave him for adoption to and Oakland County merchant. Fred M. Warner, by his own efforts, achieved large success in business lines and was elected Governor of Michigan before he was 40 years old. Prior to his election as chief executive of the State he had been the youngest senator in two Legislatures, as well as the youngest man to be elected Secretary of State, excepting Stevens T. Mason, the first governor of the state, he was the youngest governor Michigan has had, and the only governor that was elected for three successive terms.

Born in Nottinghamshire, England, July 21, 1865, Gov. Warner was seven years old when he first saw the United States.

His parents located on a small tract of wild woodland near Farmington, Oakland County. Soon afterwards his father died. P. Dean Warner was then a citizen of importance at Farmington, about 18 miles out Grand River avenue from Detroit City Hall. He was speaker of the Legislature in 1867 and a state senator in 1869. Having no sons of his own, Senator Warner adopted the young English lad and gave him his name.

The boy went through all the classes in the Farmington village school and then entered the Michigan Agricultural College. Student life did not appeal to him and so at the end of his first year in college he quit of his own accord and went to work in the general store of his foster-father. In addition to the store the elder Warner conducted a bank.

It was here that the young man learned his first lessons in trading and banking. He early showed a strong aptitude in both lines.

In Business at 20

He was barely 20 when he made his first venture in business. The bicycle craze came on and the long obsolete' high wheel machine began to appear in the early 80's. The craze caught the future Governor and he invested $165 of his savings in a wheel. For doing so his foster father reproved him. "You'll never get ahead in the world if you squander money that way," was the parental admonition. But he got back in parental favor on the bicycle question. Securing the agency of several makes he cleared $800 the first season.

Incidentally, he accumulated a handful of medals, for he became the amateur champion of Michigan.

When he was twenty-one his foster-father turned the management of the general store over to him. He had been a voter but a year or so when he was elected president of Farmington. Six times he was re-elected. His entrance into state politics was in 1894, when he was elected senator for the district that then comprised Oakland and Macomb counties, and he was re-elected two years later.

From a skeptic on the merits of the primary system when he entered on his first term, Gov. Warner before he finished his third term was an ardent advocate of the system. In the face of bitter opposition by machine legislators, he had enacted the first genuine State-wide primary law, as well as a law for the selection at primaries of party candidates for United States senator. This was several years before the Federal Consitution was amended so as to provide for the election of senators by direct vote.

Gov. Warner got his second renomination with opposition; and, still having no enemies in his party, he was re-elected in 1906 by a plurality of 97,549.

Gov. Warner had about made up his mind that, having had the customary two terms, he would retire. When the machine leaders began talking of what they would do to him if he ever again sought office, he accepted their defi. He gave notice that he was going to smash precedents and be a candidate for a third consecutive term. Twice he had been nominated by State conventions. Now he was going to seek nomination from the electors at the primaries. The machine picked a popular state official for their candidate. The primary contest was exceedingly warm.

Gov. Warner in a valedictory at the close of his third term, mentioned that, as the State's chief executive he advocated and helped make into law the Two-Cent Fare Act, the act creating the State Railroad Commission and giving the commission large powers to regulate rates, and the service of public utilities, and act making stock watering illegal and the act establishing a binder twine plant at Jackson Prison. This latter was opposed viciously by a powerful lobby of prison labor contractor, yet it has proven to be one of the best investments the State government ever made. In his valedictory he said: "The people also will benefit by a score of other good laws advocated by me and passed during my administration which those in control of the Republican Party in Michigan at this time do not dare to repeal."

Never Lost His Temper

Gov. Warner's dominant characteristics were never to lose his temper in a controversy; never to use heated language or epithets in referring to a political adversary, to try to make friends instead of enemies, yet not yield when he was sure he was right, even if by such a course he broke a friendship; to proceed cautiously before he arrived at a conclusion, but when he arrived to adhere to his conclusion; to remember his friends and also his enemies, and to be naturally genial, but never effusively so. He had a smile that was infectious, never was spoiled in the least by business or political successes. He had remained just "Fred" even to the humblest of his acquaintances and had always led a temperate life.

When 23 years of age Mr. Warner started a cheese factory at Farmington. Twenty years later he had 2 cheese factories in several counties and was making 1,500,000 annually. At Farmington he acquired a farm of 250 acres and another of 1,000 acres in Sanilac County. He became chief owner and president of the bank his foster father established, now the Farmington Exchange Bank. He was one of the organizers of the United Savings Bank, of Detroit, and has been vice-president of it since its organization.

Shortly after he retired as Governor in 1911, he began changing his dairying business, marketing in Detroit the milk from his herds, in addition to what he purchased from a great many farmers, instead of turning it into cheese.

At the state election in 1920, Mr. Warner was elected Republican National committeeman from Michigan and he held this place up to the time of his death.—The Detroit News.

MR. FARMER!
Mr. Dealer Mr. Jobber

BINDER TWINE

IT Is THE BEST

THE PRICE IS RIGHT

Are you remembering in purchasing your binder twine that you have a factory of your own at Jackson?

It is making the best twine that can be placed on the market and has a mixture of fiber this year. Manila is added to the sisal to give extra strength.

The State Farm Bureau and other organizations and dealers of the state are in position to handle your twine. If they do not, write direct for prices as we want you to use your own twine as we make 14,000,000 lbs. more than Michigan can use.

Michigan State Prison

THIS BEAUTIFUL BRIDAL WREATH
AND 4 OTHER HARDY ORNAMENTAL SHRUBS

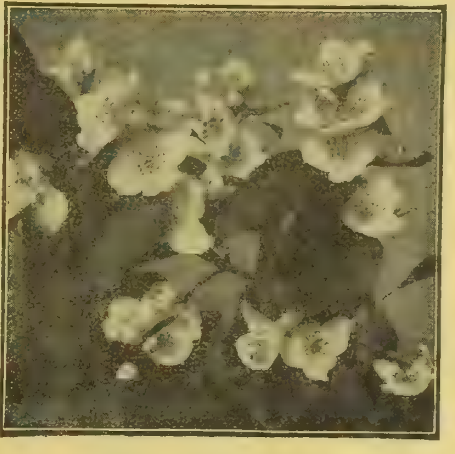
Planting a few shrubs this season will soon make your home a beauty spot and a greater joy to live in. Also, if you should later decide to sell it, you will find it more salable and worth a few hundred dollars more. Our collection consists of the following five most desirable varieties. They are not little, greenhouse-rooted cuttings, such as are often given in offers of this kind. These shrubs are all field grown, healthy and thrifty, and are sure to give satisfaction. We would recommend that you accept our special offer without delay, as this offer may be withdrawn at any time.

Beautify Your Home at Our Expense

SPIREA VAN HOUTTEI (Bridal Wreath)—A leader among shrubs, and a beautiful ornament at all seasons. A round and graceful bush with arching branches, covered with white flowers in early summer. No doubt the most useful of all shrubs.

ALTHEA (Rose of Sharon)—A beautiful shrub that nearly everyone is familiar with. Flowers profusely in late summer and early fall, when few other shrubs are in bloom.

Spirea Von Houttei (Bridal Wreath)



Syringa (Mock Orange)

BUSH HONEYSUCKLE — Handsome bush with pink and white flowers in the eary spring, followed by beautiful and showy red berries during summer and fall.

FORSYTHIA (Golden Bell) — The first shrub to bloom in the spring, the golden-yellow flowers appearing before the leaves; frequently while the ground is still covered with snow. Branches cut off in winter and put in a vase of water will bloom in the house.

SYRINGA (Mock Orange)—One of the finest of the tall shrubs. Valuable for backgrounds, screens, grouping and specimens. Flowers white and very fragrant. Beautiful for cutting.

These are the five grandest shrubs for all climates, and will be delivered to you, by parcel post, postpaid, as per our special offer below.

OUR SPECIAL OFFER

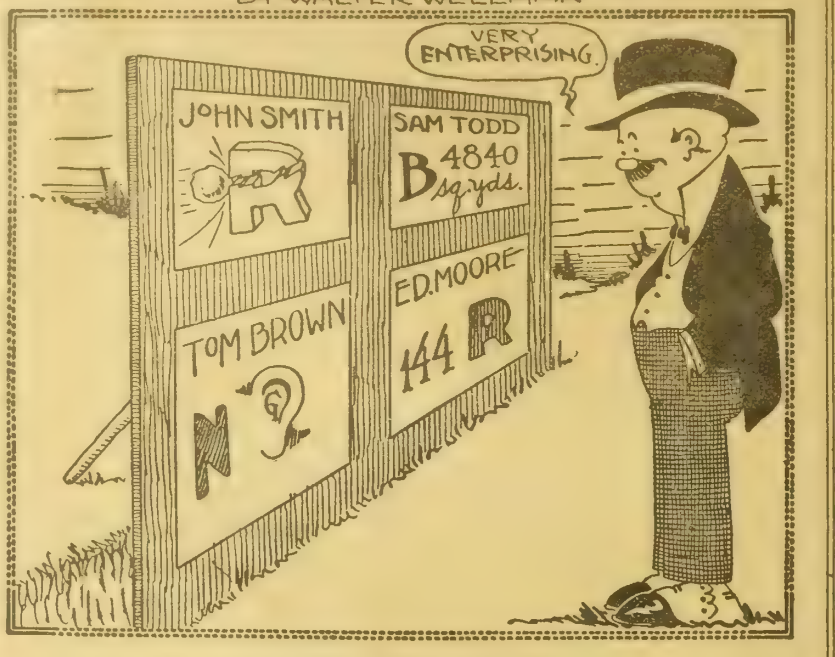
ALL FIVE SHRUBS, above described, shipped from our Michigan nursery, direct to your mail box, postage paid and safe arrival guaranteed, for ONE DOLLAR, which includes a One Year New or Renewal subscription to The Michigan Business Farmer. This may apply on your own renewal or add any new name ONE FULL YEAR.

Order of THE BUSINESS FARMER, Mt. Clemens, Mich.

The Children's Hour

OCCUPATIONS

BY WALTER WELLMAN



Several enterprising merchants have decided to combine to use one large advertising board, and split the expense. These four merchants' names are John Smith, Sam Todd, Tom Brown and Ed. Moore. What business has each?

DEAR Nieces and Nephews: All letters entered in our contest, including those published in last issue, were put on file and at 12 o'clock, April 14th, I began reading, one at a time, to decide who wrote the best letter. The first one I read seemed so very good and I laid it one side for further consideration. The second one seemed equally as good and so did the third and fourth and fifth and so on, and I continued to lay each letter aside for further consideration until when I finished the last letter and turned to reconsidor the ones I had laid aside for that purpose I discovered I had not thrown out a single one. I again went through them all but results were the same—they all best—I was no further ahead than I was when I started. Then the office force came to my assistance by choosing a committee composed of several members of the force and offering the service of the committee to decide for me. I turned the letters all over to them and they finally declared that Katie Prowant, Durand, Michigan, was the winner. And the prize is a pair of shears, small size, just right to use when doing any sewing, making patterns, etc.

Each and every department and article was declared the best but the one chose most was the article "The Truth About Henry Ford." Over half of the writers stated they thought all would be more interested in that article than any other article or department.

I hope you will not forget Mothers' Day. Remember your mother with a small token of appreciation and continue to show your love for her each day by helping her all you can with her work. Sometimes it will take you away from your play and you will not feel like doing it but remember that mother is always ready to help you and wants to have you enjoy yourself although many times it causes her considerable extra work.—UNCLE NED.

OUR BOYS AND GIRLS

Hello Uncle Ned:—I am writing to tell you which department I like best of the Business Farmer, and why I think the readers will like it, too. The 'Farmers' Service Bureau" is my choice. I think the readers will like it best because it is a clearing department for every farmer's everyday troubles, and if at any time a question on any subject comes up in their home that they want answered and answered right, all they need to do is to just let the Farmers' Service Bureau Department know about it and they answer it by return mail or through the next issue of the Business Farmer—and say, Uncle Ned, if you can't decide after April 14th, just ask the Farmers' Bureau Service Department. I'm sure it can help you. Ha! Ha! I will close with best wishes. From Katie Prowant, Durand, Mich.

Dear Uncle Ned:—I have been a reader of the Business Farmer for about two years and I thought I would write to you and your merry circle. I live on a farm of 400 acres. We raise nearly everything that is to be raised in this county, or is suitable for this climate. I have been having the most difficult time trying to find an article for this contest. It seems as tho they are all so helpful and such a service to the people it was very hard for me to pick or choose the best department in this issue, but I found it at last. Your niece, Loretta Moore, Levering, Mich. Contest letter attached:

The Publisher's Desk

This is why I think this department is the best in the issue and also in previous issues of the Business Farmer: Because it enables you to get the best advice available concerning your troubles, also there is no charge for this. It warns the subscribers of this farm paper against and concerning fraudulant oil companies and farm agencies and such companies. This department tries to give legal as well as prompt service to subscribers.

Dear Uncle Ned:—Can those that live in town, but their parents own a farm, compete in this contest? If so, I'm going to try and tell why I think "The Truth About Henry Ford" the most interesting. It shows that he is doing great things for his employees. It shows that his factories have fire departments, telephone and telegraph offices, hospitals and motion picture studio and everything that is necessary for safety and enjoyment. These are for all, the rich and the poor.

It shows that he is putting automobiles and tractors on the markets at low prices. It also shows that he is as good an American as anybody in America. This is all for now. Your niece, Mary Klurk, 209 East Plain St., Eaton Rapids, Mich.

Dear Uncle Ned:—I think your idea about our letter to you telling you what article we like the best in this magazine is a good one. I also like mystry prizes.

I read the last issue carefully, in fact, I read all of the issues. I liked the article "The Truth About Henry Ford," by Sarah T. Bushnell, the best, because I think Henry Ford is one of our greatest living Americans. You know, too, that Henry Ford may run for president of the United States, he may even be our president, and we should know more about him. This article has been running in this magazine for quite a while. I have read it every time. In the last issue it told about his schools, hospitals and other things. Don't you think the person who is bright enought to invent a Ford deserves a great deal of credit? I do. I will close now so my cousins will have room for their letters on our page. With love, your niece—Beryl Bradley, Dexter Mich.

Dear Uncle Ned:—I have read carefully each article and department of the Business Farmer, and think they are all very good, but have decided that the raising of potatoes and learning how to get the best yield is the most interesting of all. I have discussed the fact with father, and he also thinks this is an interesting article, being that they are a quick crop and easily grown. Why I think readers would like this article is because if they are farmers they naturally would want to get, also know how to get, the best yield from their crop, and they can surely find the facts they are looking for by reading the Business Farmer.—Mildred Ward, Imlay City, R4, Mich.

Dear Uncle Ned:—I am a farmer girl fifteen years of age and am in the eighth grade at school. I am 4 feet 11½ inches in heighth and weigh 104 pounds.

I think the most interesting article in the Business Farmer is "The Truth About Henry Ford," because he has the most remarkable factory in the world, and he is an extraordinary man, raising up wages and lowering the price of automobiles. Therefore, I think its the most interesting article in the Business Farmer.—Stella Adolph, R5, Yale, Michigan.

Dear Uncle Ned: I have read many interesting letters from boys and girls and liked them very much, and thought I would write to you. I am a boy 16 years old and live on a farm of 40 acres with my father and mother. My birthday is the 17th of October and if I have any twin sisters or brothers I would like t hear from them. Well, I must close but maybe I will write again sometime. Everybody please write to me as I would like to hear from you.—Joseph Forstner, Jr., Allegan, R. F. D. No. 1, Mich.

Dear Uncle Ned:—As I was reading the M. B. F., I saw you would like to have some help. I am willing to help you decide the most interesting department in the Business Farmer.

I think the most interesting department is "Poultry for Profit." I think it is interesting because some people want to buy poultry and they want to know what kind to buy for they want profit off their chickens. I also have another department I think is quite interesting. That is "Michigan Crops." I think this is quite interesting because some men are thinking of what crops to put in, where, and how much they might earn and if they read it they know better what to do.

This is the first time I am writing to you. I would like to join your merry circle. I live one quarter of a mile west of the school house. I am in the sixth grade in school. The one that guesses my age correctly will receive a letter. My age is from 10 to 15 years. I live on a ninety acre farm. I like it very well. I had a lot of fun this winter riding on my sled and skating. I have one sister and two brothers. I am anxious to know if I win the prize or not, so I would like to have an answer soon. Your niece, Florence Bloemsma, Marion, Michigan, Route 3, Box, 57.

Dear Uncle Ned:—I have read the letters in the Children's Hour and at times nearly decided to write, so at last I did. I have three brothers and one sister. I am twelve years old and in the seventh grade at school. Three schools are going to have a program together. Our school has an indian part. It is going to be a week from Friday night. I read in the last M. B. F. about the contest you were giving, and I thought it was a good chance for me to try. I have been looking at the paper and find what I think will prove of great interest to our parents and all farmers, and that is the "Market Flashes." Every farmer wants to get the best he can for his crops. But do not think I am slighting you Uncle Ned, for all us children like the Children's Hour best, but I think grown-up people are not so interested in the parts we are most. Well I must say good-bye to Uncle Ned and cousins. I wish some of the cousins would write to me. Your neice, Mildred Burk, Marion, Mich.

Dear Uncle Ned:—Of the M. B. F. I think the "Pictures from Far and Near" are very interesting, and are most pleasing to every one. The Children's Hour is very nice, too, but the pictures are the best, because old people can enjoy them as well as the young. From the pictures that we see and read about, it teaches us what there is on different lands and places. If a person does not travel or even go about a bit, they do not know anything of the world. By having pictures people can look at them and read about them and always learn, because they are never too old to learn. If the people cannot read some one could read for them to help them. We can learn how the world is progressing from pictures alone. Your niece, Rose Arnold, Box 474, R. F. D. 4, Mt. Clemens, Michigan.

Dear Uncle Ned:—I am a girl of eleven and live an a twenty acre farm and like the Children's Hour very much.

In the March 31st issue you asked the best department in the paper. I think "The Truth About Henry Ford" is the very best. His success rules are indeed true. The story is interesting because he is a real man It is wonderful; his and his wife's work of helping the poor and friendless as well as his employees. My father and mother think the story very nice. They have always liked Henry Ford. He is the poor man's friend, and a true American. His factory, foundry and trade school are certainly worth reading about. I remain, your reader, Faith E. Harris, Alpena, Mich.

Dear Uncle Ned:—I have never written before but hope you will accept this letter from an old reader. I am a farm girl and live on a farm of 160 acres. I am 5 ft. tall and weigh 103, pounds. My birthday is the 15th of April. Have I a twin? I was 13 years old. I saw Bernice Mauer's riddle and think the answer is "Each." Am I right? I would like to earn the prize Uncle Ned is giving, so here is my opinion of the things in the paper for this week:

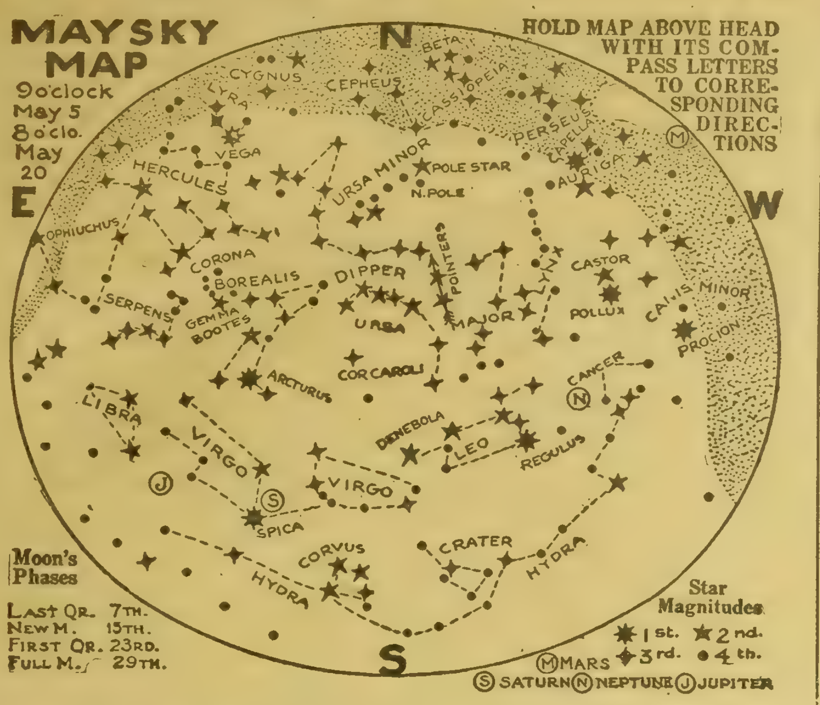
"Preventing the Potato Landslide" was good. "The Farmers' Service Bureau" and also "What the Neighbors say" and "Fruit and Orchard" are very good. "Poultry for Profit" is also good. I know that a great many people are interested in "The Truth About Henry Ford" It is very good. I think that every Michigan farmer should have the paper. It is very good. All the way around it is hard to pick out which is the best things in the paper.

There, Uncle Ned, is what I think. No one helped me make it up. I did it myself. I have no father, but have a step-father. I will go to high school Harbor Springs next year. How many of the cousins go to Sunday School and church? I do and love to. I have always gone and always will. We have a fine teacher. Goodbye with love to all the cousins. Let's boost our page. Lovingly yours, Elsie L. Mahler, Harbor Springs, R. R. 1, Mich.

Dear Uncle Ned:—May I enter your contest about the most interesting article or department in your M. B. F.? I have been a constant reader of your M. B. F. for the last few years, and I find the entire paper very interesting, but I think "The Children's Hour" is the most interesting, because it brings boys and girls closer to each other from different parts of our state and we get to know boys and girls outside of our own county and neighborhood. I do like to read the different letters from so many different boys and girls. Your neice, Peral Smith, R2, Box 66, West Branch, Mich.

The Heavens in May

By DR. C. S. BRAININ
Columbia University, Observatory staff



Every evening a curtain goes up on the "greatest show on earth", and yet it is spread right over your farm home, no matter where you live. That you may appreciate this show we publish this chart of the May sky and the comments of a famous authority. If enough of our readers indicate their interest in this department, by telling us so, even on a postal card, we will make this a regular monthly feature of The Business Farmer.—The Editor.

THE first two weeks of May present a particularly fine opportunity for the observation of the largest planet of the entire solar system, the giant Jupiter. On May 5 the planet will be in opposition to the sun, which means to the astronomer that it will lie exactly opposite the sun in the sky; it will rise at sunset and set at sunrise, approximately.

Furthermore, the earth will be nearer to the planet, and, therefore, it will appear larger in the telescope and brighter to the naked eye. Its stellar magnitude will be about minus two; brighter than Sirius, the brightest of the fixed stars, whose magnitude is minus one and six-tenths. Sirius has already set at map time and will not appear on the map for many months.

Jupiter will be found in the southeastern sky below Spica, the first magnitude star of the constelation of Virgo. No other very bright stars are near the planet and it is itself very much brighter than Spica.

Fairly close to Spica is another bright planet, Saturn, with its rings, which can easily be distinguished from the fixed star by the absence of twinkling. Saturn also is much brighter than Spica, although not nearly so bright as Jupiter. Saturn's magnitude is about plus one-half. Spica's about plus one and two-tenths. It will be remembered that the smaller the magnitude order the greater the brilliancy and that minus magnitudes are a continuation of the series of magnitude numbers toward the side of greater brightness.

If one is so fortunate as to possess a small telescope or a good field glass, observation of the satellites of Jupiter and their movements will well repay effort and time. The discovery of these satellites by Galileo was the first discovery in the heavens made by means of an optical instrument, marking a most significant milestone in the progress of science.

Galileo discovered four companions with the planet and satisfied himself by a careful study of their movements that they really were satellites of the great planet, just as the moon is a satellite of the earth. He discovered only the four larger of the Jupiter family of moons, and these are the only ones visible in any small or moderate sized telescope. But there are, in reality, nine members of the satellite family, the remaining five having been discovered by the use of the very largest telescopes and with the help of the photographic plate.

Up to 1892, which, of course, is long after the beginning of what we may call modern astronomy, only the four satellites discovered by Galileo in 1610, were known to the scientific world. In that year Prof. E. E. Barnard announced the discovery of a fifth satellite, lying closer to the planet than any of those already known. Two more were discovered photographically by the American obscrver, Perrine, in 1905. Then an eighth was found by Melotte of Greenwich, England, and a ninth and last—at present—by S. B. Nicholson of Lick Observatory in California.

These latter two are very far from the planet and have the peculiarity of moving about clock-like direction i. e., from east to west, instead of the reverse direction, which is the general direction of orbital movement in the solar system. Whether the reverse direction means a difference in origin or evolution from these satellites having the normal direction of movement is not at present clear.

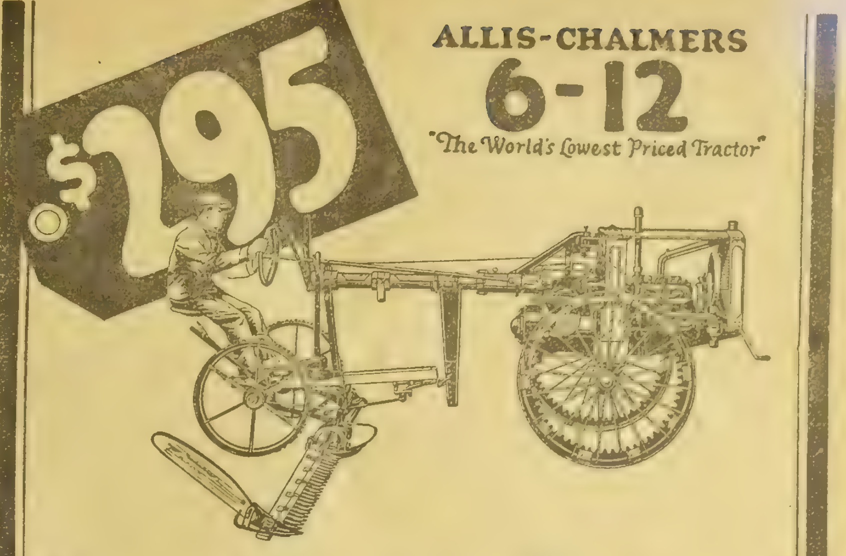
The amateur astronomer, with a small telescope at his disposal, will find particularly interesting the plotting of the movements of the satellites with respect to their great planet and also the observation of satellite eclipses which are very frequent. Since the satellites revolve about Jupiter, they will at times be hidden from view by the bulk of the planet, and this forms one kind of eclipse. Again, the satellite may be in a position where it should be visible from the earth, but is in the shadow cast by the planet, and is thus deprived of the sunlight by means of which it is made visible to us.

This is another kind of eclipse. But more interesting a phenomenon than either of these is that of the passage of a satellite in front of the face of Jupiter itself. In that case it will often throw a tiny shadow on the planet's brilliant orb, and this tiny black speck can be seen to move across the planetary disk. The satellite itself can also be seen, in a large telescope particularly, when crossing one of the dark cloud belts seen on the planet. These remarks refer, of course, to the Galilcan satellites only.

The winter constellations are now disappearing from our map and the evening heavens. The grand aggregation of stars known as the constellation of Orion, the Hunter, is below the horizon at map time, although it can still be observed low down in the West at about the end of the twilight. Sirius also is gone, and Procyon is about to follow.

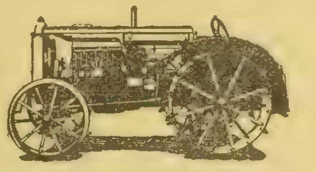
The visible first-magnitude stars are Capella in the far Northwest, Procyon in the Southwest, Pollux of the Gemini, Regulus in Leo, Spica in Virgo, Areturus in Bootes and, rising in the Northeast, the brilliant blue-white Vega of the Lyre.

It is interesting to note that a great circle through the positions of Pollux, Regulus and Spica, also Jupiter and Saturn, marks the approximate course of the celestial ecliptic through the heavens.



ALLIS-CHALMERS
6-12
"The World's Lowest Priced Tractor"

Here's Tractor Value Way Beyond Anything Else on the Market



HERE, TOO, IS SUPREME VALUE

IF interested in a 3-plow tractor, don't buy before getting the facts about the A-C 15-25. You will like its compact, advanced design; its dust-proof housing; its accessibility. Reserve power for deep plowing. Operates 26-in. separator. Lowest priced 3-PLOW TRACTORS OF ITS RATING. A smaller brother to the A-C 20-35 leading 4 plow job of the "grain states."

A SELF-PROPELLED power plant for many dollars less than a portable engine of same belt rating! Here, too—for less than the price of a good team of horses—is flexible, economical power to put speed behind some twenty jobs in the field.

Strictly a one-man outfit. Tractor wheels are the guide wheels when used with a plow, grain binder, mower or similar tool, the implement being drawn forms the rear sustaining member. Simple ideal control.

Was $795, now $295. Complete with lugs, governor, magneto, air cleaner and pulley. Act now and save $500. Price will increase when present stock is exhausted. Write today for illustrated folders.

The Farm Home
A Department for the Women

Edited by MRS. ANNIE TAYLOR

DEAR, dear friends:—Your many letters have been appreciated and I have not found time to reply to all of them, as yet, because I wanted to be sure in this page to suggest some things you must do this spring to make your grounds more attractive. Please write me some more letters on your flowers and shrubbery, I am going to hold open the prizes until I hear from you. Then remember, dear folks, I am passing around the hat for your letters on "How To Earn Money at Home", If you have found a way, how nice it would be to pass the idea along to some other woman, who perhaps has a little brood she is mothering and whom your suggestion will be a God-send. Please, write me, on the above and other subjects. I want this to be, O, such a friendly corner of our paper for the women and girls in the thousands of farm homes which The Business Farmer reaches. Remember I will never use your name or initials if you do not wish it and your letter to me will be sacredly confidential, if you wish it so, I want to be,

Your Friend,
Mrs Annie Taylor

Address letters: Mrs. Annie Taylor, care The Business Farmer, Mt. Clemens, Michigan.

SIGNS OF SPRING

The sun's so bright an' hot today
I just feel sure it's spring to stay;
My sweater's a scratchy thing,
An' that's a sure-'nough sign o' spring!
Besides, the birds are coming back
To the orchard trees. An' such a pack
Of tiny ants on the rockpile, too;
An' the air all smells so green an' new.
My daddy says warm days in spring
Make little boys grow like everything.

—Nina Hatchitt Duffield.

OF GARDENS

AND because the breath of flowers is far sweeter in the air, where it comes and goes, like the warbling of music, than in the hand, therefore nothing is more fit for that delight, than to know what be the flowers and plants that do best perfume the air. . . That which above all others yields the sweetest smell in the air, is the violet; especially the white double violet, which comes twice a year, about the middle of April, and about Bartholomew-tide. Next to that is the musk rose; then the strawberry leaves dying, with a most cordial smell; then the flower of the vines—it is a little dust, like the dust of a bent, which grows upon the cluster, in the first coming forth; then sweet-briar; then wallflowers, which are very delightful, to be set under a parlor, or lower chamber window; then pinks and gilliflowers, especially the matted pink and clove gilliflower; then the honey-suckles, so they be somewhat afar off. Of bean-flowers I speak not, because they are field-flowers; but those which perfume the air most delightfully.

—Francis Bacon.

OUR FRIENDSHIP GARDEN

DO you know what a "Friendship Garden" means? It is a beautiful thing to have. It cherishes so many loving thot's and brings us so much closer to our neighbors.

Just think, if you want to you can start one this spring and have such a variety of beautiful flowers and shrubs for little or no expense. A "Friendship Garden" means the giving of a slip off some plant or if you have a good supply of pansies or baby breath, lily of the valley, pinks or any flower that multiplies fast and you can spare some out of your garden, give it to your friend and neighbor and in exchange, she may have some different kind that would find a lovely spot in your garden.

These exchanges may start with just a root of some treasured plant that would never be missed, and what happiness it would bring to see it growing in your neighbors front-yard. A slip off of the old vine that would help cover up the bare places around Mrs. Jone's front porch.

Surely this would bring a great deal of beauty to your neighborhood and make the whole county known for its beauty and thotful women-folks. A forget-me-not bed can give so much of itself and still remain as tho untouched. The marigold is always a thing of beauty in a garden and grows so rapidly and propagates so fast.

There are so many species of Perenniels that once you have started them growing in your yard you will enjoy untold happiness from the wonderful flowers that come each year with so little effort attached to them.

Let us all try this year to see what we can do to make our front-yard attractive.

ANNUAL FLOWERING PLANTS

FOR natural beauty and pleasing color effects it is hard to beat some of the old-fashioned flower gardens made up of annual plants. Nowadays temperorary plantings are not relied upon when conditions will warrant the use of more permanent material, such as shrubs and perennials. Annual flowering plants, however, should certainly be encouraged.

When quick, though temporary, effects are desired, and when flowers are needed at a season of the year when blossoms are scarce on permanent plant material, annual flowering plants are useful. The most perennials that once you have sults are obtained with an open lawn as a foundation, with trees making a frame for the house and giving a grateful shade, accompanied by shrubs and permanent flowers to round off the corners. In the bays or pockets of such plantings, or in beds and borders , annual flowering plants will furnish bright blooms at a time when the shrubs or perennials may be dull and uninteresting. When permanent planting, especially shrubbery beds, are newly set they often look thin and ragged, and interplantings of annuals will fill in the otherwise bare spaces with attractive foliage and brightly colored flowers.

A rose arbor constructed from cedar posts. The construction is simple when covered with vines such as morning glories, honey suckle, or roses, the result is very beautiful. About a foot of the branches is left on the cedar posts.

GARDEN HERBS —LET'S GROW THEM

THE herb gardens of our grand parents' time have almost ceased to exist and the present generation knows nothing of many of the herbs cherished a generatoin or two ago, yet there are some of the old Southern gardens that have preserved the custom and uses of the herb garden. Many of us are interested in some of the several more common herbs. All of the herbs below may be started in the early spring:

Caraway.—(Carum carui). The seeds are used for cakes, confectioneries, pastries, etc., and the leaves for soups. Grown from seeds sowed where they are to grow.

Dill.—(Anethum graveolens). The seeds of this annual have a peculiar pungent taste and are used in many ways as a condiment and as an addition to (dill) pickle to increase the flavor. The whole plant is strongly aromatic. Grown from seed sown where they are to grow.

Fennel. — (Feniculum vulgare). An aromatic annual used for making tea for children and as a flavoring in cooking. Similar to oil of anise. The shoots are eaten blanched. Seed, leaves and stems used.

Horehound.—(Marrahium vulgare). The leaves and buds of this perennial are used for making cough medicines and for flavoring candy. Propagated by seeds or division of plants.

Lavendar.— (Lavendula vera). This hardy perennial produces flowers used for the distillation of the oil of lavendar, lavendar water, etc. The dried flowers are used for cushions and stored with linens and wearing apparel to which is imparted the pleasant and characteristic lavendar odor. Propagated by cuttings and seed.

Peppermint.—(Mentha piperita). A perennial hardy species, grown mainly for producing oil of peppermint which is used in candies, chewing gum, and as a disguise in medicines and has several other uses.

Sage. — (Salva officinalis). The common herb intimately associated with pork sausage, used in medicine and as a flavoring for various products of the cook's art. The leaves should be taken when the flower spikes are forming, spread in a dark room, and dried as quickly as possible. Propagated by seeds, cuttings, and root division.

THE FLOWER GARDEN
Vines for Arch or Trellis

ANNUAL Vines.—Balloon - vine, wild cucumber, hop-vine, morning-glory, moon-flower, balsam pear, scarlet runner bean.

Perennial Vines (Harbaceius).—Kudzu vine, moon-flower, everlasting, wistaria.

Woody Vines.—Aklebia, Virginia creeper, Dutchman's pipe, clematis, bittersweet, mattrimony-vine, honeysuckle, trumpet creeper, grape, wistaria.

Vines for Brick and Stone.—Boston ivy, English ivy, euonymus radicans, ampelopsis quinquefolia.

Beauty Border of the Vegetable Garden

Annuals.—Cosmos (mixed), dahlia (mixed), sage, floss flower (blue), zinnia, tickseed (yellow), verbena (mixed), petumia (mixed), bachelor's button, cockscomb, corn-flower, china aster (white), spider plant, marigold, pansy (mixed), Shirley poppy, cone-flower, sweet-william.

Shrubbery and Perennial Garden

Trees and Shrubs.—Apple, golden bell, barberry, spirea, globe-flower, deutzia, buddleia, hibiscus, weigelia.

Perennials. — Candytuft, peony (red), Oriental poppy, iris (blue), alyssum, Canterbury bells, milfoil, phlox (pink), phlox (red), phlox (white), tickseed, blanket flower, helenium, pink, Shasta dairy, hollyhocks, golden glow aster.

Window Boxes

Plants Enduring Shade.—Asparagus, trailing, green; dracaena indivisa, upright, green; dracaena terminalis,. upright, red; English ivy, trailing, green; sord fern, upright, green; whitmani fern, upright, green; pandanus, upright, variegated; vinca, trailing, variegated; Wandering Jew, trailing, variegated; German ivy, trailing, green.

Flowering.—Pansy, prostrate, yellow, purple, white.

Mothers Problems

Sometimes Delay Punishment

A MOTHER of my acquaintance had purchased a beautiful dinner-set, the first real "set" she had ever owned. Together she and her daughter were washing it and putting the glossy flowered dishes in the china closet. The mother, on her way to the dining-room with a stack of bright dinner-plates, kicked up the rag rug that lay a few steps from the table. The daughter, following directly after her failed to notice the upturned rug, caught her foot in the fold and fell, her own stack of dishes crashing to the floor and breaking into hundreds of pieces.

At the crash the mother turned and glared angrily at the girl. She placed her own dishes on the table and started with hands clenched toward her daughter. Then, suddenly, she relaxed. She bit her lips, then pointed toward the hallway. "Eva," she said, "go up to your room at once. Stay there till I tell you to come down. Right now I am too angry to think what I ought to do."

By the time the mother had cleared away the wreckage, noticed the turned-up rug which she then remembered having kicked up, and calmed down somewhat, she was ashamed of the feeling she had shown toward the daughter who was not to blame for the accident. As soon as she could she went to the girl's room, where she found her sobbing on the bed, told her she realized it was an accident and asked her to come down and help with the rest of the dishes.

A punishment for that accident would have been unjust, and the child would have known it was unjust and been hurt, perhaps forever, by it. Yet many, many unjust punishments are meted out to children because the parents punish in the heat of their anger without waiting till they can judge calmly and correctly.

Remember this incident next

"In the morning early, if the day's work seems too much for you; if your confidence is low; your courage gone,—why that's just the time to work in your garden."

placed her own dishes on the table and started with hands clenched toward her daughter. Then, suddenly, she relaxed. She bit her lips, then pointed toward the hallway. "Eva," she said, "go up to your room at once. Stay their till I tell you to come down. Right now I am too angry to think what I ought to do."

By the time the mother had cleared away the wreckage, noticed the turned-up rug which she then remembered having kicked up, and calmed down somewhat, she was ashamed of the feeling she had shown toward the daughter who was not to blame for the accident. Soon as she could she went to the girl's room, where she found her sobbing on the bed, told her she realized it was an accident and asked her to come down and help with the rest of the dishes.

A punishment for that accident would have been unjust, and the child would have known it was unjust and been hurt, perhaps forever, by it. Yet many, many unjust punishments are meted out to children because the parents punish in the heat of their anger without waiting till they can judge calmly and correctly.

Remember this incident the next time some accident or deed occurs which rouses you to sudden anger. Rather than ever punish unjustly, send the child responsible for your feelings to his room and do not go to him till you have weighed his offence most carefully. If you would not later be filled with regret, it is sometimes best to delay punishment.—Margaret Bartlett.

MOTHERS' DAY

MOTHERS' Day—it means so much! Mothers' Day should hold for her all the things that are beautiful. How happy we should be upon May 2nd, when we can show our living mothers all the tenderness and thotfulness that only a child of hers can show. No matter how trifling the deed mother will think it the sweetest and noblest because her boy or her girl was thotful of her on this Day set aside to commerate the ones that have passed on and the day to show the living. Let us not be forgetful.

HOME SUGGESTIONS

PAINTING wire screens before putting them up in the spring will keep them from rusting and will make them look like new.

Porch chairs and stands can be gone over with a water-proof varnish—also good for renewing kitchen furniture that has become dingy.

Provide a place for refuse so that it may be easily put "in its place;" a waste basket of some description does this, and there is need for one in practically every room in the house. There are innumerable varieties of sizes, shapes and styles of baskets on the market; everything, from the most inexpensive to the very elaborate or some simple home-made one may be made to serve.

There is an old trick that many mothers know nothing about. That is to cut off a boy's stocking at the ankle and turn it around so that the thin darned places at the knees go underneath, where it does not show.

The Runner's Bible

We must humble (Ps. 37: 11), willing to be taught (Prov. 13: 18), to receive, andthen when joy has been let into the heart (Neh. 8: 10), and gratitude is felt, we are in a condition to receive the blessing—to know the Truth, and we can be assured that Love will guide us, that success will ultimately crown every endeavor, for all things work together for good.

We must also protect ourselves from all that would bring us harm, or even disturb us, by realizing that we are enveloped in an impenetrable armor of love and evil cannot reach us.

—if you are well bred!

At the table men should remain standing until all ladies present are seated.

Do not begin eating until all have been served.

Place napkin in lap.

Eat quietly and slowly.

Fork should be used with tines upward.

When not in use, place knife and fork across plate.

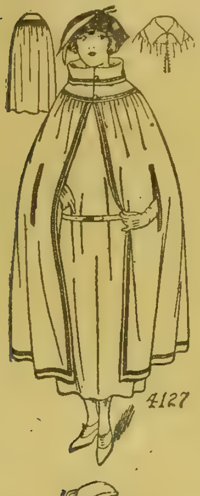
Sit quietly until all have finished.

Notice "Polar Bear Flour" ad in this issue and send for the free cook book.

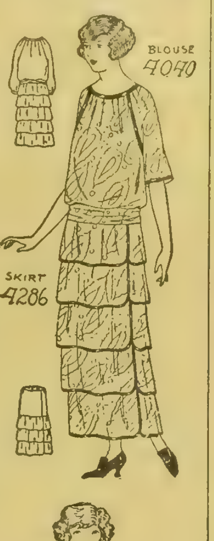
AIDS TO GOOD DRESSING

As usual there will be much sewing done in the spring, so the first step is to get the sewing machine and shears in good condition. It is hard to spare the shears to be sharpened after work is begun and on the other hand it is encouraging to find them sharp and well set when work commences.

Give the sewing machine a thorough overhauling. Take a soft cloth. Dip it either in kerosene or gasoline and wipe off the oil and dirt which has accumulated. Wipe until the parts are clean and bright. Remove ravelings which have wound around the joints. When all parts are clear tighten the screws and see that everything is properly adjusted. Oil in every place where one part rubs against another. The machine is delicate in its mechanism and should be well kept and oiled to keep it from wear and also to make it run easily. A few drops of oil put on the wooden case and rubbed in well with a soft cloth will improve its appearance. See to it that the machine is supplied with needles of desired sizes and if the belt is worn a new one in the draw may save a day's delay.



4127



BLOUSE 4040

SKIRT 4286

A Jaunty "Wrap"

4127. This is a splendid utility style, suitable for all cloakings. As portrayed tweed was used, with trimming braid. The collar is convertible.

This pattern is cut in 4 Sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A medium size requires 5½ yards of 44 inch material.

A Jaunty Blouse Dress for Slender Figures

4330. This is a good style for sports materials, for taffeta, kaska, jersey and serge. Vest, collar and cuffs may be of contrasting material. A very attractive development would be red and gray ratine, with red suede for trimming, or linen, with checkered gingham.

The Pattern is cut in 3 Sizes: 16, 18 and 20 years. An 18 year size requires 4¼ yards of 40 inch material. To trim as illustrated requires ¼ yard contrasting material 40 inches wide. The width of the skirt at the foot is 2¼ yards.

A Pretty Gown for "Many" Occasions

4040-4286. Printed silk with binding of crepe satin is here portrayed. This design is also good for voile, organdy or tissue gingham. The tiered skirt is very new and effective. It may be finished with three tiers. The blouse has a comfortable "raglan" sleeve that may be finished in wrist or elbow length.

The Skirt is cut in 6 Sizes: 25, 27, 29, 31, 33 and 35 inches waist measure. The width at the foot is 2⅝ yards. The Blouse is cut in 6 Sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. To make this dress as illustrated for a medium size requires 8¼ yards of 36 inch material.

A Simple, Pretty Frock for A Little Miss

4347. Printed voile or crepe would be attractive for this style. It is also pleasing in summer, taffeta and crepe de chine. Binding in a contrasting color would be effective for trimming.

This Pattern is cut in 4 Sizes: 4, 6, 8 and 10 years. A 6 year size requires 2¼ yards of 32 inch material.

DAIRY and LIVESTOCK

FARM DAIRYING

SOMETIMES farmers who keep cows as a source of income rather than to gratify a hobby, are inclined to discount records made by pure breds, claiming that big daily yields of milk are made by milking three or four times a day or by resorting to other methods which are artificial or unnatural. No doubt the claim that the yield is the result of extra labor and not due to the natural producing ability of the cow is true in some cases, but not in all herds, for example, that of W. J. Gamble of Caro.

In this herd seven pure bred Holstein cows, freshening since Christmas, and milked but twice a day, showed on the barn sheets so far in April, an average production of 64.44 pounds each per day. Of course part of such good production is due to good care given these cows by the manager, Thomas Kimmell, but the main credit must be given to the cows themselves, that, standing in stanchions, without any babying, can roll out practically 30 quarts of milk each per day.

And some farmers say that once in a while a cow without any forcing can give a big flow for short time but she would have to be pampered to stick to it throughout the year. Such farmers may well ponder over the record made by a pure bred Holstein in a Cow Testing Association in Livingston County where she was given ordinary care by an ordinary farmer, fed ordinary farm feeds and milked but twice a day throughout the year. She yielded 17,246 pounds of milk and fat enought for 801 pounds of butter; and incidentally showed a profit over her feed costs of $187.00.

There is certainly something in pure blood and breeding when cows can show every day production such as these cows did.

DOCK YOUR LAMBS

MR. Louis F. Swift has a farm at Everett, Illinois, thirty miles from Chicago, and has had more or less to do with raising sheep and lambs. Mr. Swift says:

"In order to realize best returns in the production of lambs, a certain rule must be followed. Much money has been lost by people raising lambs through failure to observe this rule, prevalent in the western states, which is as follows:

> " 'All lambs must have their tails cut off, and all the bucks not needed for breeding purposes must be made wethers when about two weeks old.'

"Nothing is so discouraging and inexcusable or financially disastrous as to see lambs in the fall or later, with long tails (which means negligence on the part of the raiser), or buck lambs sold at a big discount on account of their coarse quality for mutton, in the fall, which should have been made wethers in the spring and sold for a premium as wethers."

DETROIT CREAMERY HOG SALE

THE Detroit Creamery Farm had a very snappy Hampshire sale at Utica, Mich., March 19. The greater portion of the offering was taken up by Michigan buyers. The top sow selling to C. J. Cheeseman, of Clarkston, Mich., for $118.50. Strevel & VanCamp of Blaine, Mich., bought five sows and one of the good young boar pigs. Three sows and a boar pig to Bert Coulon of Mt. Clemens, Mich. Col. F. H. Hulick of Atlanta, Ind., officiated in an efficient manner and was ably assisted by C. R. Bowers of the Hampshire Advocate. The 39 pigs sold brought $2,486.00 an average sale of $63.74.

Lot No. 1, Boar, sold to Fred Smith, Utica, Mich., $410.00; 3, boar, sold to Fred Strevel, Blaine. Mich., $82.50; 4, boar, sold to W. V. Reid, Richmond, Ind., $85.00; 5, boar, sold to Bert Coulon, Mt. Clemens, Mich., $70.00; 6, sow, sold to C. J. Cheeseman, Clarkton, Mich., $118.50; 7, sow, sold to Fred Strevel, Blaine, Mich., $52.50; 10, sow, sold to Burt Coulon, Mt. Clemens. Mich., $75.00; 11, sow, sold to Earl Terry, Clarkston, Mich., $50.00; 12, sow, sold to Fred Strevel, Blaine, Mich., $40.00; 13, sow, sold to Keystone Farms, Marion, Ohio, $42.50; 14, sow, sold to Bert Coulon, Mt. Clemens, Mich., $35.00; 15, sow, Fred Smith, Utica, Mich., $60.00; 16, sow, sold to Gust Cishke, Rochester, Mich., $52.50; 17, sow, sold to W. V. Reid, Richmond, Ind., $52.50; 18, sow, sold to H. G. Gamber, Mt. Clemens, Mich., $67.50; 19, sow, sold to Mrs. J. C. Brown, Wabasha, Minn., $67.50; 20, sow, sold to W. V. Reid, Richmond, Ind., $35,00; 21, sow, sold to W. V. Reid, Richmond, Ind., $50.00; 22, sow, sold to C. H. Jones, Pontiac, Mich,, $65.00; 23, sow, sold to Elmer Moore, Utica, Mich., $62.50; 24, sow sold to Julius Kendt, Mt. Clemens, Mich., $42.50; 26, sow, sold to Helen Target, Warren, Mich., $57.50; 27, sow, sold to C. R. Wolford, Plymouth, Ohio, $37.50; 28, sow, sold to Keystone Farms, Marion, Ohio, $50.00; 29, sow, sold to Floyd Gale, 47.50; 32, sold to L. J. Smith, Utica, Mich., 37.50; 33, gilt, sold to H. G. Gamber, Mt. Clemens, Mich., $67.50; 34, gilt, sold to W. V. Reid, Richmond, Ind., $45.00; 35, gilt, sold to G. Cishke, Rochester, Mich., $50.00; 36, gilt, sold to W. V. Reid, Richmond, Ind., $37.50; 37, gilt, sold to W. V. Reid, Richmond, Ind., $37.50; 38, gilt, sold to Fred Strevel, Blaine, Mich., $55.00; 39, gilt, sold to Fred Strevel, Blaine, Mich., $60.00; 40, gilt, sold to Bert Coulon, Mt. Clemens, Mich., $30.00; 41, gilt, sold to Jos. Weingartz, Halfway, Mich., $50.00; 42, gilt, sold to Fred Strevel, Blaine, Mich., -$52.50; 43, gilt, sold to Howard Gibson, Oxford, Mich., $35.00; 44, gilt, sold to Dr. Sharp, Romeo, Mich., $60.00; 45. gilt, sold to Mrs. Leason, Warren, Mich., $50.00.

VETERINARY DEPARTMENT

CANNOT KILL TICKS BY FEEDING SULPHUR

Will you kindly inform me whether sulphur if fed to sheep will kill the ticks on them? How should I feed sulphur to sheep, in their salt or grain, and how long and how much would I give 50 sheep to rid them for ticks? —L. K., North Branch, Michigan.

—The feeding of sulphur to sheep will not destroy the ticks, nor cause the ticks to leave the sheep. Sulphur is relished by sheep and they use considerable sulphur in producing a good fleece of wool. We, therefore, add some sulphur to the salt which we give our sheep. Just at present we are feeding our sheep the following mixture in place of salt:

20 lbs. salt, 20 lbs. precipitated bone meal, 5 lbs. sulphur. There should be no danger of the sheep catching cold if they get wet while taking this mixture.—G. A. Brown, Prof. of Animal Husbandry, M. A. C.

RAISING PIG ON BOTTLE

Will you please tell me what to feed a little pig when raising it on a bottle?—W. H. L., Belding, Mich.

—The feeding of orphan pigs is rather a difficult matter and requires very close attention to detail. As a general rule it is not advisable to endeavor to alter the composition of cow's milk any, but rather to start the little pigs on whole milk, feeding then from six to eight times per day a small allowance each time. To start with, a pint of whole milk per day per pig is sufficient. This should be gradually increased until the pigs are receiving about one quart of milk per day per pig, by the time they are two weeks of age, at which time the number of feeds may be reduced to three or four.

The pigs may be taught to drink by placing the milk in a shallow pan or dish and forcing the little pigs' heads in until they get a taste of milk two or three times and they will soon learn to drink. Where the bottle is resorted to, it means too much work where one has a little of eight or ten pigs. In addition to the milk, the pigs should be given access to good corn and also middlings in a small self-feeder, where they may help themselves at will. Salt, charcoal and wood ashes should be kept before them at all times.—Geo. A. Brown, Prof. of Animal Husbandry, M. A. C.

SHORTHORNS

Richland Shorthorns

SPECIAL OFFER: Two choicely bred cows. One roan—One white—One with bull calf at foot by son of IMP. Rodney. This show stock of real caliber and great foundation material. A bargain at the price.

C. H. Prescott & Sons.

Office at Tawas City, Mich. Herd at Tawas City, Mich.

SHORTHORNS

Home of Merry Commander, Junior Champion at the recent International. Now is the time to buy. We have several young cows and heifers, bred to this wonderful bull, for sale. Also, several bulls and heifers of breeding age, from our other noted sire, Perfection Heir 3rd. Visit or write us at once.
S. H. PANGBORN and SONS, Bad Axe, Mich.

RAISE SHORTHORNS WITHOUT HORNS Like Kelley does. U. S. Accredited Herd No. 28945. For description and price write,
L. C. KELLY & SON, Plymouth, Michigan.

Polled Shorthorn Bulls and Heifers 3 to 12 mo. old. C. W. Gilts bred. Boars to use. White and yellow dent seed corn, heavy yielding. Write your wants. Frank Bartlett, Dryden, Mich.

JERSEYS

FINANCIAL KING BULLS
OF SERVICEABLE AGE

Buy a Financial King Jersey bull from register of merit cows. Why not own a real bull that is sure to breed wonderful sons and daughters. Terms to responsible parties. Prices reasonable. Write to Emil Anderson, Coldwater Jersey Farm, Coldwater Mich. Mich. home of Financial Kings.

REG. JERSEYS, POGIS 99th OF H. F. AND Majesty breeding. Young stock for sale. Herd fully accredited by State and Federal Government. Write or visit for prices and description.
GUY C. WILBUR, BELDING, Mich.

HEREFORDS

HEREFORDS

Young Cows with calves by side consisting of blood from America's foremost herds at prices that enable them under Earliripe Hereford Beef Plan to pay for themselves within a year to 18 mos. Bulls including prize winners at the larger shows at practical prices. Herds headed by Straight Edge 1169786, one of two sons of Perfection Fairfax out of a daughter of the famous Disturber.
T. F. B. SOTHAM & SONS
(Herefords since 1839) Saint Clair, Mich.

HEREFORDS FOR SALE. SEVEN CHOICE yearlings and heifer calves and seven yearling bulls sired by Wyoming 9th. International Prize winner. Farmers prices. Herd established in 1860 by Gov. H. H. Crapo. Write for information. CRAPO FARMS, Swartz Creek, Michigan.

REPEATER BRED HEREFORDS. YEAR Bulls, price $75.00. Good individuals.
JOSEPH FELDPAUSCH, Fowler, Michigan.

BROWN SWISS

O. I. C.

O. I. C. BIG TYPE GILTS FARROWED MAY 15th. 22 weighing 300 lbs. Bred to Leighty Monster, an outstanding boar. We have been breeding and shipping O. I. C.'s for 20 years. NEWMAN'S STOCK FARM, Marlette, Michigan.

REGISTERED O. I. C. SOW, DUE TO FARrow in July, weight about 500 lbs; 2 years old; bred to registered boar. Only $50.00. Selling out is reason for selling her.
GILBERT VANDE VOOREN, R. 1, Ada, Mich.

REGISTERED O. I. C. BRED GILTS FOR sale. Weighing 250 lbs. A few fall boars.
J. R. VAN ETTEN, Clifford, Mich.

HAMPSHIRES

HAMPSHIRES—SPRING BOARS AND BRED gilts from 25 sows to select from. Place your order now or you may be to late. 10th year.
JOHN W. SNYDER, R. 4, St. Johns, Mich.

IS ORGANIZATION HELPING POTATO MEN

(Continued from Page 6)

severe blizzards, the market underwent a marked raise, from 30c to a dollar in a few days. What was the situation of the organized farmer, selling thru his co-op. and the man who "lets Blinks have 'em because I get the cash right off?"

C. C. Wells, Exchange Manager at Cadillac, has recently made this clear in a letter. He says, "During the first 16 days of March our average net returns to growers for potaties were 52c a hundred on plain sacks and 60c a hundred on branded sacks. This average is based on the sales of 151 cars.

"During the same period independent buyers in western Michigan paid an average of only 31.5 cents per hundred. In very few cases did dealers' prices reach our lowest figure, and at many small country points they paid as low as 15 to 20c a hundred.

"The jump in prices which occurred March 1st gave our competitors a chance to take unfair advantage of the growers' ignorance of market conditions. The advance was so sudden that many farmers sold at the old prices; and, even a week later, some did not know the real situation. Such persons are "easy picking" for speculating buyers who have an opportunity, under such conditions, to regain some of the money lost in bucking the Co-op. heretofore.

"A farmer at Weidman made $159.60 by refusing a dealers' offer of 25c and shipping through the local association. Our pool price netted him 63c. He advertised this result in his neighborhood and, as a result, the Weidman warehouse was again plugged full of potatoes.

"Ivan M. Nielson, Manager at Gowen, wrote me—'If your prices continue to be as far above local prices as they have been for the past two weeks, we will ship for many new members and will handle more cars than ever before.' "

California farmers have found prosperity by merchandising their products, not dumping them. The story of the prune, orange, lemon, raisin, and walnut growers is, or should be, an old one to us in Michigan. But "selling to Blinks because I get the cash" is not merchandising. To use plain terms, it is pin-healed short sightedness. It is placing enough of your product in competitive hands to break your own market and bear down your own price. The reports of the Michigan Potato Growers Exchange for the past winters are in your Farm Bureau Office. Run and see them. Learn of the many times when independent dealers in Southern Michigan undersold your Exchange in Pittsburg, in Cleveland, in Chicago—undersold them with the same potatoes you "sold to Blinks for Cash"—and forced the Exchange prices down, thus cutting off your own nose in return.

No, co-operative merchandising is not going to benefit you as long as you let your neighbor do it, and you "sell to Blinks for the cash." Your organization is now set up and working. Give it your support. If any grower has to sell for cash, a method can be found to deal with his own organization that way. New credit laws, passed through organized farm bureau influence by the last Congress, are providing a way to do this. We have got to do it ourselves.

Co-operative marketing will at best be but half-success, a milk and water Michigan reflection of the 180-proof California brand, till we see into this thing far enough to stop competing with ourselves in our own market.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912, of The Michigan Business Farmer, published biweekly at Mount Clemens, Michigan for April 1, 1923. 1. That the names and addresses of the publisher, editor, managing editor and the business managers are: Publisher, Georoge M. Slocum, Mount Clemens, R. F. D. No. 4, Mich. Managing Editor, Milon Grinnell, Mt. Clemens, Mich. That the owners are: Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock. The Rural Publishing Co., Inc., Geo. M. Slocum, M. H. Slocum, W. W. Slocum, Mt. Clemens; C. Allen, Lake; Aug. & E. Amos, Owosso; E. Ellsworth, Oden; N. Powell, Oden; C. J. Pratt, Charlevoix; J. Ritzler, Rogers; F. R. Schalck, Chicago; F. A. Lord, Gaylord; W. Schriner, Marine City; A. Voss, Luther; B. Wolff, Riggsville; F. Yost, Bridgeport. 3. That the known bondholders, mortgagees and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none so state.) Citizens Savings Bank, Mt. Clemens; R. R. Olds, Detroit, Mich. George M. Slocum, Publisher. Sworn to and subscribed before me this 14th day of April, 1923. Mae R. Sullivan. My commission expires August 29, 1923.

EARLY BROILERS
November Layers

Make it ten weeks from peeps to broilers—two-pounders.

Do it this way:
Keep them healthy.
Keep them hungry.
Feed the old reliable

Dr. Hess Poultry
PAN-A-CE-A

Never mind about indigestion, diarrhea, leg weakness and gapes. Pan-a-ce-a takes care of all that. There will be wellness, cheer and good growth.

PAN-A-CE-A your chicks—then put them on the scales at ten weeks, set her at two pounds, and watch that beam come up!

You will see a mighty difference in the feather growth, too, between your flock and a non-Pan-a-ce-a flock.

Pan-a-ce-a will develop your pullets into early henhood—fall and winter layers.

Tell your dealer how many hens you have. There's a right-size package for every flock.
100 hens, the 12-lb. pkg. 200 hens, the 25-lb. pail
60 hens, the 5-lb. pkg. 500 hens, the 100-lb. drum
For fewer hens, there is a smaller package.

If Ruptured Try This Free

Apply it to Any Rupture, Old or Recent, Large or Small and You are on the Road That Has Convinced Thousands

Sent Free to Prove This

Anyone ruptured, man, woman or child, should write at once to W. S. Rice, 408B Main St., Adams, N. Y., for a free trial of his wonderful stimulating application. Just put it on the rupture and the muscles begin to tighten; they begin to bind together so that the opening closes naturally and the need of a support or truss or appliance is then done away with. Don't neglect to send for this free trial. Even if your rupture doesn't bother you what is the use of wearing supports all your life? Why suffer this nuisance? Why run the risk of gangrene and such dangers from a small and innocent little rupture, the kind that has thrown thousands on the operating table? A host of men and women are daily running such risks just because their ruptures do not hurt nor prevent them from getting around. Write at once for this free trial, as it is certainly a wonderful thing and has aided in the cure of ruptures that were as big as a man's two fists. Try and write at once, using the coupon below.

Free for Rupture

FARM MECHANICS

BLASTING DRAINAGE DITCHES WITH DYNAMITE

WITH the possible exception of clearing cut-over land in the states of Wisconsin, Michigan and Minnesota, more dynamite is used for blasting drainage ditches than for any other agricultural purpose. What this means can perhaps be realized by considering that one single orchardist uses more than a carload of dynamite every year for planting fruit trees. There are two distinct methods of blasting ditches, known respectively as the propagation method and the electrical method. These names are not entirely satisfactory, for a propagation ditch can be shot electrically, as will be explained. Straight notroglycerin dynamite of 50 per cent and 60 per cent strength has the property of transmitting the detonation impulse from one cartridge to another, even when these cartridges are buried in the ground, with incredible speed. In soft, mucky, swampy land, dynamite of the type mentioned will propagate an explosion when placed in holes as far apart as twenty inches and some-times farther. Eighteen inches is the standard distance between holes for ditches requiring but one cartridge per hole. The operation is as follows:

A line or string is stretched along the course of the proposed ditch. At every eighteen inches a hole is made in the ground, usually with a pointed crowbar, to the depth desired, and a cartridge f 1¼" x 8" 50 per cent straight dynamite is placed in each hole not deeper than thirty inches. It is necessary to prime, or put a cap in, but one of these cartridges and that is the one nearest the center of the line of charges. Either an electrical blasting cap or a blasting cap and a piece of fuse may be used. We usually put an extra dynamite cartridge in this central hole to be sure that the initial detonation is perfect. In ordinary swamp land it is not necessary to tamp the holes at all. The central hole is exploded either by lighting the fuse or by connecting the electric blasting cap wires to a blasting machine by leading wire and operating the blasting machine. The shock is communicated from the center charge to the adjoining charges which pass it on to those next and so on at the rate of about 15,000 feet per second, so that as far as the eye can see the whole line of ditch explodes at once and a regular curtain of mud goes up several hundred feet in the air. The result is a perfectly straight and completed ditch requiring no trimming and leaving no spoil bank. This is the quickest and most effective method of digging a ditch in wet soil.

It is not practical however in dry sand, and care should be taken in attempting such a ditch in wet sand or gravel. In any case it is not wise to attempt to blow the whole ditch at first. Test shots of fifteen or twenty feet along the line of the proposed ditch should be made with different spacings and different charges until the operator is satisfied that the charge and spacing is correct for his purpose. The principal error that beginners commit in blasting a ditch is placing the charges too deep. While the action of explosives is in the line of the least resistance, they are so quick that the ditch will be excravated several inches below the bottom of the charges.

The propagation method is used extensively to make ditches for draining swamps, meadows and low lands and can be used where any other method would be out of the question, as for instance through a tangle of briars, underbrush and other vegetation. Where stumps, logs, boulders or other obstructions are encountered in the line of the proposed ditch, extra charges of dynamite are placed under such obstructions so that they will be blown out along with the ditch.

The electrical method has one advantage over the propagation method in that it can be used in any kind of soil whatever, although in dry, shifting sand it is not possible to blast a ditch very economically. Holes are made in the ground to the desired depth as before, but are spaced farther apart up to thirty-six inches for ditches requiring only two or three cartridges per hole. Each hole is primed with an electric blasting cap and these electric blasting caps are connected in series, up to the capacity of the blasting machine available; that is, if you have a No. 3 blasting machine you can fire only thirty holes at a time; if you have a No. 5 blasting machine you can shoot one hundred. Another advantage of the electrical method is that any kind of high explosive can be used, although a 40 per cent Red Cross Extra is the grade usually recommended. Where stumps or other obstructions are encountered in the line of the ditch and extra charges are necessary to blow them out, each of these extra charges has to be primed with an electric blasting cap.

While ditches blasted with dynamite are perfectly satisfactory for open drainage, the surrounding material is so loosened and shaken up by the explosion that they do not serve well for placing tile drains. Blasted ditches retain their shape and slope as well as, or better than, dug ditches. Of course, no ditch is a permanent channel. Most ditches will fill up in time, but a blasted ditch does not fill up any sooner than any other kind.

Up to about the first of January, 1923 the agricultural representatives of one manufacturer of dynamite had collectively blasted about one hundred and twenty miles of drainage ditches with dynamite, nearly all of it by the propagation method. How many hundred miles of ditches have been blasted by farmers, road engineers, health officials, and for mosquisto and malaria control is not known but is doubtless an impressive mileage. Almost any kind, length, width or depth of a ditch can be blasted by dynamite if enough explosive is used and necessary care and intelligence are exercised.—Arthur La Motte, E. I. du Pont de Nemours & Company.

CHANGING TIMES

By JOHN T. BARTLETT

FARM taxes have gone up rapidly. Moreover, they are not likely to come down, in most places. That is not such unpleasant news as it first seems, if we look into the situation.

The explanation of higher taxes is partly a higher standard of community living, and partly a higher level of community efficiency. Taxes in the writer's neighborhood, for example, for 1923, are practically double what they were in 1922. The district has put in a new and costly school plant. This fine, large, brick building has running water, electric lights, excellent heating and ventilating systems. There are manual training and domestic science departments. Teachers employed grade with those employed in large cities; they have far better training than the "schoolma'ams" of our youth—and they receive far higher salaries.

Though we are "in the country" we have city educational facilities.

Now, this district could have got along with the kind of schoolhouses districts commonly used ten, fifteen and twenty years ago. It wanted something different. The best was not too good for the boys and girls. So the district voted to have the best. And now the district is paying the price—high taxes.

On one side, high taxes are caused everywhere by a higher standard of community living. The community treats itself to a softer deal at the hands of life. And pays the price in taxes.

The second cause of high taxes is a higher level of community efficiency. Good roads are not luxuries. They are community equipment. Farms are operated at a greater profit: The whole community gets the most from its resources and labor. Taxes are a part of the cost of doing business.

The receipt for low taxes everywhere is the same. As a community, do without things. Do without fine schools, town buildings, good roads, etc. But do you want to? You don't!

SMALLER FARM FAMILIES

A RECENT survey by competent investigators showed that it costs, under typical farm conditions, $3,000 to raise a child to the age of 18 years.

The exact figure doesn't matter. What is fundamentally significant is that it costs a great deal to raise a child properly on the farm, and though this figure is unquestionably much less than for the town child, and the farm child in the way of labor contributes considerable to his maintenance, the cost is increasing from decade to decade. Moreover, it is increasing faster through the current period than at any previous time.

The average family is small, not through fear of childbirth, or a shirking of family responsibilities, but a moving desire of parents to do all for such children as are born as they merit. Back before the Civil war, before the age of machinery, a growing child's labor matched, sometimes exceeded, his or her keep. There was no economic obstacle to doing for one's children all that others did, and to having a large family. Then there were large families.

There began to be smaller families as children began not to pay their way—as machine methods came in with which human labor could not compete. As they paid their way less on the average farm, the size of families continually decreased. The number of children kept considerably higher than with town families because it was far less expensive to raise a farm child than a city child.

The gulf between a farm child's economic return and the expense he entails steadily widens, and as it widens the number of children decreases.

We can expect smaller and still smaller farm families. One result absolutely assured is that, simultaneously, more and more operations on the farm will be performed by machines. Tractor farming is an eventual certainty. Investment in farm equipment will constantly increase. Farm population, in relation to city population, will grow less.—John T. Bartlett.

HORSESHOE PITCHING

FIFTEEN-YEAR-OLD BOY IS WORLD'S CHAMPION

A 15-YEAR-OLD lad in knickerbockers now holds the national horseshoe pitching championship, Harold Falor, of Akron, Ohio, having tucked away first honors under his belt at St. Petersburg, Fla., where the mid-winter national tournament was held.

In taking the championship young Falor dethroned Lundin, of New London, Ia., who finished second in the tournament. Lundin won his laurels at Des Moines, Ia., last Summer. C. C. Davis, Columbus, Ohio, carried off third prize and Frank Jackson, Kellerton, Iowa, who held the championship for several years, finished fourth. Michigan's champion, L. M. Wilkes, of Battle Creek, won seventh place. There were 30 men and 6 women entered in the tourney.

Mrs. J. F. Francisco, of Muskegon, Mich., now holds the women's national championship, taking first place at the St. Petersburg tourney. Mrs. C. A. Lanham, of Bloomington, Ill., forfeited her title, failing to compete in the mid-winter event.

In addition to winning the national honors, Falor was bestowed with a diamond studded gold medal and was handed a check for $500. Lundin won second and was given $300, while Davis got third money, amounting to $200. Frank Jackson, fourth, was awarded $175. Many other splendid prizes including a number of horseshoes, were awarded winners. The women also were given cash prises, Mrs. Francisco carrying off a check for $75, in addition to other prizes.—R. B. Howard, Editor Horseshoe World.

N- Y. Dairy League Sets Pace for Michigan

(Continued from Page 4)

themselves became boosters and were of constant assistance to the salesmen.

This year many new dealers have been taken on and the old dealers have all requested new contracts.

The ice cream activities of the association had a wonderful effect upon its farmer members everywhere and why not? They saw these outdoor signs and painted walls offering to the public a product of their own farms and factories. They couldn't go into town but what they would see in the stores, their city friends enjoying this delicious ice cream. Frequently along the state roads they met the great yellow League trucks equipped with every modern contrivance for refrigeration and delivery. They saw at the railroad stations groups of the League ice cream freezers on their way to and from the market.

What could make a stronger appeal to their pride and interest? What could better boost the moral of the membership? Many farmers offered space on their barns or silos for the outdoor advertising bulletins of the League ice cream. Not only do the farmers of the association read these advertising signs that are so prominent a feature of the Empire State landscape but they impress themselves upon the senses of of the tourist from cities and from other states. And there is another thing that the tourist sees as he rides over New York State highways. At the front gate or conspicuously posted on the front of the dairy barn or house he will see the Dairymen's League membership sign setting forth the fact that the owner of the farm is a member of the Dairymen's League Cooperative Association, Inc. and is proud of it. These signs are ten by twenty-seven inches and are made of metal and painted in the conspicuous blue and white colors which are used in all of the League's advertising.

These Farmers Bank on Quality

Just a word as to the quality of League products and there is only one word—the "best." Not only by popular approval but by actual analysis, League ice cream and League evaporated milk and condensed milk contain a higher percentage of butter fat, that is, of real cream, than any other similar product on the market. This has had a tendency to stimulate other manufacturers to raise the quality of their products but the farmers are still one jump ahead of them.

It is quality that these business farmers are banking on. They believe in advertising and advertising in a big way but more than this they believe in making good on their advertising by delivering the quality. This is beginning to bring results with the consuming public wherever the League products are sold.

The Plan of Operation

The association operates on what is generally called the pooling plan. No matter in what form the milk of these farmers finally reaches the market, so far as returns are concerned, it is all blended in one pool. That is, the money received for all this milk in one form or another is blended into one amount, expenses of administration and certificates of indebtedness deducted, and an average or base price ascertained. The price which each farmer receives for his milk varies to the freight zone and the butterfat of his milk of like quality in like amounts is always paid for at the same base rate.

The association, on April 1, was operating one hundred and fourteen plants, seventy of which it actually owned. These operations are all controlled from the central office of the association and require about sixteen hundred employees.

These farmers now own one of the biggest and best distributing plants in New York City, formerly the Levy Dairy Company plant. This plant is capable of handling six thousand cans of milk per day and a large quantity of pooled milk is now being distributed to wholesalers and retailers in New York City through the League's metropolitan plant. The trucks which are connected with this plant are also used in transferring the League evaporated milk from railroad stations to distributing centers throughout the city. This plant was purchased by the association because the farmers felt that they needed to have their own outlet for at least a part of their pooled milk reaching the New York market.

At the present time about four hundred people are employed for the clerical work in the offices of the association at Utica and New York City. There are nine hundred and fifty-four membership units called local associations, each one being incorporated under the laws of the State. The League territory is divided into twenty-four directors' districts with a director elected for a term of three years from each district. Each year eight directors are elected. The locals elect delegates to attend what are called district meetings where directors are nominated and elected. Elections are by ballot and the result is announced at the annual meeting of the association held on the third Thursday in June each year. Only actual dairymen who are producing milk for the market may become members of the association.

As organized at present the highest departmental executive of the association is the sales and advertising director. The recent growth in sales and the increasing importance of the marketing activities of the association have made it necessary to move the sales and advertising offices from Utica to New York City.

During the cancellation period in February last there were something like ten thousand withdrawals. A large proportion of these were withdrawals that did not in any way effect the pooling operations of the association. During the year over nine thousand new contracts were signed up which much more than offset any reductions brought up by cancellations. In short, the past year has seen the Dairymen's League solidify its membership. Criticism and rumors and propaganda have served to strengthen the loyalty of these pooling diarymen. They have come to understand and believe in their association and in its leadership.

They are now entering upon a period where the emphasis will be upon the merchandising of their products. In other words, the Dairymen's League Cooperative Association, Inc. has passed through its period of organization and is now rapidly developing into a business organization capable of successfully merchandising in the face of the keenest competition in the world, every one of the products it is producing and manufacturing.

RABBIT HIDE TANNING

(Continued from Page 9)

thick. The above quantity is only enough for two or three pelts. Let it remain three or four days, where moderately warm, say at least 60 degrees, then remove the paste and gently work the skins between the hands until soft. The more pelts are handled and worked the softer they will be. Rabbit hides, however, are tender and must be handled carefully.—Fur Editor.

TIME TO PLOW CLOVER UNDER

I would like to know when would be the best time to plow sweet clover down? I want to plow the first crop down, when would it do the most good, when it is green or when dry? —B. C., Traverse City, Michigan.

—The first crop of sweet clover should be plowed down during the early fall after the plants have practically finished their growth for that season. It is advisable to plow crop under at the time it has reached its maximum growth and before the plant has lost too much of its moisture. If it is still green it will stay decaying much more readily and become more thoroughly incorporated into the soil.—C. R. Megee, Asso. Prof. Farm Crops Dept., M. A. C.

HELPFUL WIND

While on his recent visit to this country Marshal Foch made a witty reply to a man, who, when one of the guests at a inner party in Denver, given by a party of Americans, took exception to French politeness. "There is nothing in it but wind," he said with questionable taste. "Neither is there anything but wind in a pneumatic tire," retorted the gallant Marshal, "yet it eases the jolts along life's highway wonderfully."—The Argonaut.

Poultry for Profit

POULTRY DOES PAY

A COMPARATIVELY small proportion of the people who keep chickens have any definite figures to know just exactly how profitable their hens have been. There is a general notion in the minds of poultry keepers who are giving their birds a fair chance by feeding them properly and providing comfortable houses that the time and attention which the chickens require are well paid by the returns. However, it is very difficult to secure figures which can be used as a definite basis for stating whether or not the poultry enterprise, as commonly carried on among farmers, is profitable or otherwise. Indeed, there are many economists who assert that if the poultry flock were properly charged with all the feed eaten and allowance were made for the hours of labor actually spent, it would be found that poultry keeping was a poorly paid occupation.

The numerous instances of specialty poultry keepers who are making satisfactory incomes from devoting their entire time to poultry raising rather disprove the assertion that intelligent application of time and energy to the problems of poultry keeping cannot be made to yield a satisfactory recompense. However, the fact that here and there a farm, where exclusive attention is given to poultry raising is succesful does not necessarily prove that a poultry flock as a side line on a general farm which receives only such care as can be furnished in the time left after attending to the various other farm duties is an enterprise that justifies its existence by the financial rewards.

For the reason that such figures are relatively scarce, the reports from the demonstration farm flocks in Indiana and Missouri ought to be of particular interest to farm poultry keepers in general.

A poultry news letter from the Division of Poultry Husbandry of Purdue University, located at Lafayette, Indiana, shows that the demonstration flocks scattered thruout Indiana managed by practical farmers on their own farms returned a labor income for 1922 of $2.45 per hen. This report shows that the average demonstration farm 234 hens. These hens layed an average of 128 eggs each and these eggs brought an average of 30 cents per dozen. The records show that it cost $1.53 to supply the feed for each individual hen on these demonstration farms. This feed cost, however, includes the feed fed to roosters and growing stock and is somewhat higher than the amount required for feeding hens for egg production where no young stock is being raised. However, since the typical farm poultry enterprise includes the raising of chicks each year to replace the layers which may die or be culled out, the feed cost per hen on the basis of the total amount of feed used by the flock, ought to be of practical value to poultry keepers.

Reports from the University of Missouri, Agricultural Extension Service, released a few weeks ago show that the records from 289 demonstration flocks, conducted by farmers scattered throughout the state of Missouri, show an average of 154 hens kept on each farm which layed 128 eggs per hen during the year ending November 1, 1922. The feed cost for each hen on these farms was $1.31 and the net labor income over feed cost was $2.51 per hen. The average demonstration farm in Indiana kept 234 hens, which produced a labor income per farm of $572.81, while the Missouri demonstration flock averaged only 154 hens per farm and produced a labor income of $385.24 per farm.

In either case the labor income would go a long way toward paying ordinary farm wages to one person, and anyone familiar with poultry feeding methods on the average farm knows that the average farm flock does not by any means require full time and attention of any member of the family nor require enough attention from all members of the family to justify paying straight time to anyone for taking care of the poultry.

THE "CHICKEN FEVER"

WHEN the chicken fever gets a good hold on anyone it seldom or never lets go. Our "Cullud brudders" are attacked by it in early life and there are other night marauders which have an appetite for a bit if chicken to the great vexation of the poultry raiser.

There are some who raise chickens who term themselves fanciers and they are; there are some who wish to be fanciers and will become so. There are others who fail to class and they are apt to join the ranks of utility breeders. The man who is breeding fancy poultry depends upon sales of stock and hatching eggs for his income, the utility man from eggs alone.

To Keep Up Prices

If he is a real fancier he never sells a male bird for within around two dollars of what such a one would bring as market poultry, which is right. No male should ever go into a breeding pen that is not worth $5, and $10 would be rather more appropriate and the fanciers from that price up—or as far as one likes.

Sell the market poultry, keep up prices and raise the standard of the flocks. The sale of five hens, winners in a laying contest, is reported at $400 each or $2,000 for the quintette. For a world's record Buff Orpington hen $5,000 is said to have been reported. The $400 hens were bought by a commercial poultryman, one who sells baby chicks and is no novice at the game.

Fifty Dollar Pullets

We never get quite that bad down here in Maine, yet the fever has run fairly high at times. Even at the recent Maine State Poultry Show $25 females were frequently quoted and the author seemed to take it quite as a matter of course and the writer heard of cockerels there which had cost as high as $40 and that would be rather low in real high-class chicken society.

Prices depend much upon how badly the owner wants the money and how badly the other fellow wants the bird. There is one Maine man who frequently gets a chance to ship choice pullets at $50 and perhaps even more. There are few early layers among the birds of the ultra fancy. A pullet doesn't lay many eggs before she is "off bloom."

Time of Hatching

The commercial poultry foods warranted to make hens lay, find no place in the pens of the fancier. Foodstuffs are sought that discourage egg production and methods like walking the pullets in the snow have been employed for the same purpose.

The object is to insure egg production around March 15th to May 1st. A lot of hatching is done between May 1st and June 1st but not by them who are looking for pullets commencing to lay by October 15th and in a month from then they should be going strong.

Hens or Pullets?

There are many who believe the year-old hens are fully as profitable as pullets, even more so. It seems probable some one will be hatching chickens in August for the next year layers. Such chickens would get a good start before winter and could be held back a bit to begin laying in September of next year. The few who have tried this speaks highly of the laying qualities of the birds hatched at that time.

There is a lot of good money in the poultry business. A couple of ladies of our acquaintance report about $1.25 each above cost of feed for 100 cockerels sold at market prices. Their accounts were accurately kept. Now this would give them their pullets free of cost and sufficient to pay for time in caring for the flock. Besides this there is a fascination in poultry and a good profit in a well-kept flock.

How Many of Your Chicks Should Die?

ANYONE planning the poultry operations for the season who did not figure on a part of the chicks dying would be indeed an optimist if he did not deserve to be designated by some harsher term. It is entirely in the nature of things that some chicks out of every flock will be lost by accident, disease, or the attacks of vermin and varmints.

Since the percentage of the chicks which die before reaching marketable age is a very important factor in determining profits, it should be of interest to every poultry keeper to have some definite figures on the rate of mortality which may be reasonably expected in trying to grow chicks. In the hazards of life which are coverable by insurance, particularly as applied to humans, the probabilities of death for a given age has been worked out to a mathematical certainty which places the business of life insurance on a scientific basis.

Possibly due to the fact that each individual chick represents such a small economic quantiy but few figures are available to show the reasonable rate of motality in attempting to grow chickens out of baby chicks. For the reason that such figures are relatively scarce, reports from a large number of demonstration farms in Indiana which show that an average of only 63 chicks are raised out of each 100 hatched, ought to be of interest. These same figures show that for each 100 eggs set only 57 chicks were hatched and since 37 percent of these chicks died before reaching marketable age, only 36 chicks were raised out of each 100 eggs set. Since at least half of these chicks are likely to be roosters, approximately six eggs had to be set on these Indiana farms for each pullet raised.

Possible to Raise 75 Percent

While definite figures covering any large number of poultry plants are relatively scarce, showing the percent of chickens raised, the Indiana average is somewhat lower than is generally considered satisfactory. On well-managed poultry plants where the chicks are given the benefit of satisfactory brooding equipment and scientific feeding methods, it is usually possible to raise at least 75 chicks out of each 100 chicks hatched and the commonly accepted figure for a well-managed plant is that one pullet may be expected to reach maturity from each five eggs set.

It has been frequently stated by observers as well as by great numbers of poultry keepers that brooding the chicks is the most difficult part of the poultry keeping project on the farm. The Indiana report laid much of the blame for low percentage of chicks raised there to poor equipment for brooding, lack of experience on the part of the poultry keeper, and disease among chicks. Probably the most important of these items is poor brooding equipment . For some reasons the development of brooding devices did not keep pace with the discoveries and inventions in methods of hatching chicks, and it is only in recent years that really satisfactory brooding equipment has been devised for the use of poultrymen who hatch chicks by artifical heat or who handle them in large numbers.

Not Ideal for Small Flocks

At the present time the stove brooder, operated in a movable colony house, provides almost the ideal brooding conditions for the flock owner who can hatch his chicks in units of from 200 to 500, but not many farms are supplied with this kind of brooding equipment. Not so much attention has been paid to the development of brooders for small flocks and even today there is no well - recognized, satisfactory method of brooding chicks in flocks of 50 to 200. The development in electrical brooders offers much promise for poultry keepers who have access to electric current as relatively inexpensive electric hovers can be constructed or purchased for brooding the small flocks of chicks. However, the majority of farm flocks do not and will not have access soon to electric current, so the development of these brooders are of secondry interest to farm poultry keepers.

While the hen is by no means an ideal brooder, a well-behaved hen in a well-constructed coop is probably the safest brooder for small flocks of chicks. As many as 25 chicks can be safely intrusted to one good-sized hen providing she has a good, roomy coop so she can handle her flock. For best results in using hen brooders, however, the hen should be confined and the coop be arranged so the chicks can go in and out as desided during fair weather.

POULTRY AS A SIDE LINE

THERE are few side lines open to dairy or mixed farming that offer the same certainty of satisfactory profit as does poultry. Small flocks of poultry are almost an integral part of all farms. We refer particularly to poultry as a worthwhile side line looked after with the same intelligent interest that a good dairy farmer bestows on his cows. On many such farms in the Pacific northwest, flocks of 100 and 200 hens are adding many dollars to the incomes of their owners. The farmer who is acquainted with the best and modern poultry knowledge receives satisfactory returns from his poultry. The fundamentals of profitable poultry keeping may be briefly summarized as follows: A breed to lay a strain of pullets hatched out early in the spring and well grown on free range; all culls removed from the flock; liberal feeding and correct housing. These are requirements that are simple and easy to understand. However, the personal equation counts for much as it does with high producing cows, for poultry, to be successful, demands regular attention.

FEATHER PULLING

We have a flock of white Wyandotte hens and they pull the feathers out of one another and eat the feathers. Do you know anything that will stop them? R. T. M., Ulby, Michigan.

—Feather pulling is a canabalistic habit frequently caused by close confinement or faulty nutrition. Very often one or two individuals in the flock are specializing in this practice although it may become quite general if the ring leaders are not segregated once this trouble is in evidence.

This practice usually stops after the birds are out on free range and therefore we would suggest inducing as much out door exercise as possible. The ration should contain at least ten per cent meat scrap or tankage, or some other form of animal protein. Skim milk is a common source of protein for laying stock but frequently we find it necessary to supplement it with additional protein in the dry mash which should be before the birds at all times.

In order to break the birds of this habit I would suggest providing a mash of 30 per cent bran, and 20 per cent middlings, corn meal, and ground oats, and 10 per cent meat scrap plus about 1 per cent salt. Very satisfactory results have been obtained by hanging a beef liver suspended off the floor so that the birds may all pick at it. Glandular organs of this kind, usually contain a dietary essential known as Fat Soluble A that is frequently lacking in the ration. In addition, the liver is extremely palatable and should cause the birds to forget the practice of feather pulling.—E. C. Foreman, Associate Professor of Poultry Husbandry, M. A. C.

RAISING GEESE

How should geese be mated? Should goose eggs be treated differently than hen eggs? What is a good feed for goslings?—M. G. Berrien County, Mich.

—A gander may be mated with from one to four geese, but pair or trio matings usually give the best results. Wherever possible provide free range for the geese. Collect the eggs daily and keep in a cool place. If kept for some time they may be stored in loose bran. Usually the first eggs are set under hens, while the last ones that the goose lays may be hatched either under hens or under the goose if the latter becomes too broody. Removing the eggs from the nest from which the goose is laying is advised. If not removed she usually stops laying sooner than when taken away. Dust the hens that are hatching the goose

High Producing Vigorous PureBred Baby Chicks

Capacity 1[illegible]0,000 healthy chicks at a setting

eggs with incest powder and see that she is given good attention, as the period of incubation is longer than in that of hens eggs, running from 28 to 30 days. Add some moisture to the eggs after the first week is set under hens or in an incubator. This is usually done by sprinkling the egg or the nest with warm water. set from four to six eggs under the hen and 10 to 13 under the goose. When hatching under hens, since the the eggs hatch slowly, the goslings are usually removed as soon as hatched and kept in a warm place until the eggs are hatched, when they are put back under the hen or goose. The hens with goslings should be confined to a coop and the goslings allowed to range. Do not allow the goslings to go into the water until they are several days old. Goslings do not need feed until they are from 24 to 36 hours old, when they should be fed any of the mashes suitable for chickens or ducklings, or a mash or dough of two-thirds shorts (middlings) and one-third cornmeal, which can be made of equal parts shorts and cornmeal and 5 per cent of beef scraps added after six weeks. Bread and milk has often been found to be an excellent feed for young goslings. fine grit or sharp sand should be provided for goslings by feeding 5 per cent of it in their mash or keeping it in a hopper before them. Provide shade in hot weather and when the goslings are young give them attention, as they may get lost or caught in deep holes and in rubbish. Drinking fountains or pans should be constructed so that neither goslings nor older stock can get their feet into the water.

RATION FOR EGG PRODUCTION

Please recommend an economical and practical ration for egg production.—Reader.

—There are a number of rations for egg production recommended, depending very largely upon the feed at the command of the poultryman. A good scratch grain ration is made as follows: Ten pounds shell corn, five pounds dry oats. For a dry mash use three pounds wheat bran, three pounds wheat shorts, one and one-half pounds of meat scraps. Three gallons of skimmed milk or buttermilk daily will take the place of meat scraps. For successful egg production milk or some form of lean meat should be supplied in every ration. Barley or wheat may be used instead of oats. Barley meal or ground oats may be substituted for shorts in the mash. Clover or alfalfa meal may take the place of the bran. A good grade of tankage may be used instead of the meat scraps. Feed a grain ration in deep straw so as to compel the birds to take exercise. We suggest feeding the mash in dry hoppers that are self-feeding, in troughs, or a supply may be kept before the birds. Supply an abundance of good clean water and give free access to sharp grit, crushed oyster shell or soft limestone grit.

HENS BECOME LAME ALL OF SUDDEN

Would like to know if you could tell me what is the matter with my hens. They seem to be all right and all of a sudden go lame and don't seem to have any use of their legs and lay around under the roost. They don't stay that way long but get poor and quit laying. I keep it clean and dry with plenty of oat straw. I have fed a poultry tonic all winter with their mash.—G. H., Ithaca, Mich.

—Leg weakness is a common and prevalent ailment at this time of year. It is sometimes referred to as "spring complaint" or as "layers' cramps." Very frequently birds that are in heavy production succomb to this trouble.

The cause of this ailment has not been definitely understood. In some cases faulty housing conditions are responsible, especially if the floors are damp. We have noted that eggs produced by hens subsequent to developing this trouble frequently contain blood clots which indicates internal hemorrhages are partly responsible for such trouble.

Our variable weather conditions such as we experience during the spring months affect the rate of yolk development and abnormal ruptures of the yolk occur which usually create a nervous condition and affects the physical condition of the hen, resulting in leg weakness. This latter cause applies more especially to temperorary leg weakness. If the trouble is more of a permanent nature, it may be due to faulty nutrition. A moist mash containing about five per cent of paper pulp will correct this condition where cellulose has been laking in the ration.

There is a possibility that tuberculosis is present in the flock and in order to make an accurate diagnosis it may be necessary to make a post morten examination. Doctor Stafseth of the Bacteriology Department will be glad to receive any specimens you may care to have diagnosed. He will in each case identify the disease and prescribe a suitable method or treatment.—E. C. Foreman, Associate Professor of Poultry Husbandry, M. A. C.

CAN HATCH EGGS IN INCUBATOR

Please tell me whether duck eggs can be hatched in an incubator or not? Can you give me full information how to do it and how to raise young ducks? — H. S., Croswell, Mich.

—Duck eggs can be successfully hatched in incubators providing that a high moisture content is supplied. It is usually a good practice to take a whick broom and a dish of warm water each day after the fourteenth day and spray a small quantity of the water on the eggs. One of the members of the Department is preparing a bulletin on the subject of duck raising and pending publication of this bulletin we would refer you to the Department of Agriculture, Washington, D. C., for their literature on this subject.—E. C. Foreman, Associate Professor of Poultry Husbandry, M. A. C.

MITE INFECTION UNDER SKIN

We killed a hen which we were going to cook. While cutting it up we noticed little yellowish white spots on the flesh just under the skin. When we scraped on the flesh the would come off. They only seemed to be on the breast and under the wings and neck. Do you think this is the starting of lice? This hen was fat and had been laying and she looked healthy enough. —Mrs. R. W., Owosso, Mich.

—The condition encountered is undoubtedly connective- tissues mite, scientifically termed Laminosioptes cysti-cila. It is a mite infection occurring on, in or under the skin and is not injurious to health. Birds which have the parasite on the skin sometimes show scaly formations. It may be possible that general measures to prevent mites from barboring in the coop would keep it from spreading. Spraying the coops with kerosene emulsion and treating the birds with sulphur oint might be a means of preventation. The condition, however, is not serious.—H. J. Stafseth, Res. Assoc. in Bacteriology, M. A. C.

TROUBLE NOT ENTIRELY DUE TO LICE

I have 100 baby chicks a week old, Anconas. They seem to have something peculiar ailing them. Seven have died, others ailing. Yesterday I found one dumping, so I picked up several and examined them carefully for lice using a little microscope but could not find any but found one on my hand with the microscope that I couldn't see at all with my eyes. They get seemingly almost raw around the head and neck and across the back. The feathers seem eaten right off and also the skin. I put vaseline on but they seem to go faster then ever afterwards. I have them with two old hens, fine mothers which we have dusted about three times with lice powder.—Mrs. R. F. S., Brown City, Mich.

—It is very difficult to diagnose the trouble that you are having in your flock of 100 Anconas. If lice are present they will usually be found either below the wings or vent, or near the top of the head. The use of sodium fluoride is generally recommended and has given excellent results. It can be purchased in powdered form and requires only a small pinch applied to the above mentioned areas. I am of the opinion that the trouble is not entirely due to lice and would need further information on the method of feeding, etc., in order to arrive at the cause of this trouble. The Ancona chicks should be showing feathers

HATCHING EGGS

HATCHING EGGS
S. C. White Leghorns. Tom Barron Strain, 250 egg utility line. November to April, average 65 per cent. Pure white plumage. Range grown, healthy, vigorous stock. Eggs $1.50 per 15; $4.00 per 50; $7.00 per 100. Prepaid. Limited supply. Order from this ad now.
MAPLEWOOD POULTRY FARMS
C. W. Bovee, Prop. North Star, Michigan.

EGGS FOR HATCHING—UTILITY STOCK. Grand White Wyandottes—M. A. C. Champions. Good, square deal. Reasonable prices. Send for price list.
C. W. HEIMBACH, R. 5, Big Rapids, Michigan.

WHITE WYANDOTTES MARTIN STRAIN, Eggs for hatching.
WAYNE CHIPMAN, R. 2, Washington, Mich.

SILVER LACED AND WHITE WYANDOTTES Four large, beautiful roosters. Eggs $1.50 per 15.
C. W. BROWNING, Portland, Michigan.

EGGS FOR HATCHING: FROM THE FOLLOWING varieties, Barred, Buff and White Rocks; Silver Laced, and White Wyandottes: S. C. White Orpingtons, and S. C. Black Minorcas. Eggs, $1.25 for 15, $2.25 for 30, prepaid. From pure bred Good Laying Stock. Booking orders for eggs. Order early. **BENJAMIN SCOTT, Bannister, Mich.**

BUFF ROCK EGGS BY 10 LB. MALES and 1st Cincinnati, O., winners. Hogan tested hens, heavy layers.
J. C. CLIPP & SONS, Box M, Saltillo, Ind.

THOROUGHBRED BUFF ROCK EGGS from Blue Ribbon Winners, $1.50 per 15; $9.00 per 100.
BALDWIN & NOWLIN, R. 4, Laingsburg, Mich.

BARRED ROCK HATCHING EGGS. NORMAN Heavy Laying Strain.
MRS. JESSIE B. DEAN, R. 1, Mason, Mich.

BARRED ROCK HATCHING EGGS. PARKS 200-egg strain. $2 per 15; $5 per 50; $10 per 100 by prepaid parcel post.
R. G. KIRBY, R. 1, East Lansing, Michigan.

FOR SALE—BARRED ROCK HATCHING EGGS from good winter layers. $1.25 per 15 or $2.00 per 30 postpaid.
Mrs. Frank Millikin, R. 1, Roscommon, Mich.

THOMPSON STRAIN BARRED ROCK EGGS by 9 lb. males, bred to lay. Dark matings $1.75 per 15; $3.00 per 30 prepaid.
MRS. FRED KLOMP, St. Charles, Michigan.

PURE BRED BUFF ORPINGTON EGGS AT $2-15; $5.50-50. Prepaid.
MRS. ANNA LA NOUE, Fostoria, Michigan.

S. C. REDS, GOOD LAYING STOCK, FINE color. Hatching eggs, $6.00 per 100. Limited number of chicks, $16.00 per 100.
EDWARD CRYDER, Alamo, Mich.

ROSE COMB RHODE ISLAND REDS. HATCHING eggs $1.25 per setting. Postpaid.
Mrs. Albert Harwood, R. 4, Charlevoix, Mich.

REDS: BOTH COMBS, CHESTER COUNTY and Harrison Pierce strain. Eggs $1.50 per 15 postpaid. **Leo Van Conant, New Haven, Mich.**

SILVER SPANGLED HAMBURG Eggs for Hatching, $1.50 setting. Write for prices on all varieties.
ROSEDALE FARMS, Port Huron, Michigan.

BOURBON RED TURKEYS. EGGS 50c EACH.
THOS G. CALLAGHAN, Fenton, Michigan.

MAMMOTH PEKIN DUCK EGGS FOR SETTING $2.00 or two settings $3.00. Also **Wild Mallard** Duck eggs same price. Very choicest stock. All orders prepaid. **Cedar Bend Farm, Okemos, Mich.**

LEGHORNS

LEGHORNS
S. C. Buff Leghorn Hens, Pullets and Cockerels. Hens and pullets $2.50 each; cockerels $3.00 to $5.00 each. Show birds a matter of correspondence. **LAPHAM FARMS, Pinckney, Mich.**

PULLETS BARRON ENGLISH WHITE Leghorns, eight weeks to maturity—May to October. Breeding flocks repeatedly culled by experts. Extra large and vigorous. Wedge shaped bodies, big looped combs. "Lay-bilt" in every way. Also breeding cockerels. Satisfaction and more or money back.
MORSE WHITE LEGHORN FARM,
Belding, Michigan.

TURKEYS—DUCKS—GEESE

2 PUREBRED BRONZE TURKEY TOMS FOR sale. Large birds.
MRS. FRANK IRVINE, R. 2, Hersey, Michigan.

TOULOUSE GEESE ARE MONEY MAKERS. Two pounds cost less to raise than one of pork. Water not necessary. Every farmer should raise a few. **ALDEN WITCOMB, Byron Center, Mich.** Breeder Giant Toulouse Geese, White Holland Turkeys.

HIGHEST PRICES PAID FOR LIVE AND Dressed Poultry, Veal, Eggs. A square deal always.
C. E. McNEILL & CO.,
825 W. So. Water St., Chicago, Ill.

over the back at the ages of 5 and 6 weeks. Evidently the chicks have not reached this age so that they are still in the danger zone of Bacillary White Diarrhea infections which may be present.—E. C. Foreman, Associate Professor of Poultry Husbandry, M. A. C.

CHICK ACTS QUEER

We have a baby chick that was hatched one night and taken away from the hen the following noon with nine other chicks. This perticular chick acted very queer when I took it off. It would go through the funniest motions with its head and whole body, then it would drop its head and act lifeless. Then it would rise up and go through the same motions over and over. What causes this and what is a good remedy?—L. R. V., Delton, Mich.

—This is usually classified by hatchery men under the head of "Cripples and Fools." In incubation work a large number of chicks are found whose actions coincide exactly with those described. Possibly the shell membrane became glued or attached to the head during incubation and with the result that the chick became crippled and had an attack of brain fever.—E. C. Foreman, Associate Professor of Poultry Husbandry, M. A. C.

PACKING DOWN EGGS

Will you advise the correct way to pack down eggs using water glass? I put some down according to directions which were published some time ago. I started packing the fore part of August. How long after eggs are placed in the solution before it becomes solid?—A. E., Applegate.

—A certain amount of vaporation will take place but water glass should never become solid. It is usually a good practice to keep the surface of the liquid at least two inches above the eggs at all times. This is easily accomplished by adding water from time to time. Sometimes eggs are inclined to float and a rock or other weight is used to keep the eggs below the surface.—George F. Davis, Instructor in Poultry Husbandry, M. A. C.

THE VALUE OF OATS

MOST people underestimate the value of oats for poultry of all ages as a valuable and all-around feed. During the war we found that it would largely take the place of wheat in the ration if properly handled in relation to other ingredients. It is one of the best all-around feeds for laying hens and it is impossible to observe injurious effects from a liberal use in the ration if it is handled with any judgement at all.

In fact, we have found that it is an absolute necessity in the laying ration. Many commercial poultrymen who are credited with doing wonders with hens and pullets feed it in large quantities, some keeping it before the hens all the time in hoppers. Fed in sprouted form, it unquestionably is an economical and beneficial feed, increasing the much-desired bulky element in the ration, supplying the necessary green food elements, and cheapening considerably the cost of the ration as compared against the more highly concentrated, and, therefore more expensive grains.

For growing chicks, from the baby chick on up to the matured pullet it is, with the single exception of wheat and wheat derivatives, the most valuable grain we have. Rolled or steel cut oats for baby chicks will make them grow faster than anything else. Of course something else has to be fed in connection with the oats, but where it is the base of the ration it will produce chicks superior to any chicks ever raised on any other ration.

As soon as the chicks are two months old, one can commence to feed whole oats, provided they have developed properly. Soak the oats half a day and feed at noon with the water squeezed out, in pans, all the chicks will eat in 10 minutes. After the first week of soaking, this process can be discontinued and the oats fed in dry form in hoppers, allowing the growing chicks all they will eat. You will be surprised and gratified at the unusual growth they make and at the real economy in feed cost.

It is a mistake to make corn or corn meal the base of the growing chick ration, as so many people do. It is the cause of many of the evils experienced in raising chicks. It often is the direct cause of leg weakness because it tends to fatten faster than the muscles develop or are strengthened by exercise, and it often is the direct cause of digestive troubles, apoplexy in chicks, and of other troubles. Wet corn meal, such as so many people fed chicks, is an abomination. The fact that you have "gotten by" in the past on such feeding is not because of feeding it but in spite of it. The real comparison will be to try oats as a base and compare results with the former method.

Oats is always considerably cheaper on the market than most other grain feeds—certainly such grain feeds as are susceptible of use in the poultry ration. The element of cost often half or more of the cost of corn, and the superior results obtained from its use, should commend the grain to every poultry feeder. If oats will "make kids husky," as one manufacturer of rolled oats states, and as many parents know to be true isn't it fair to say that they will also make chicks husky? We know they will.

Uncle Rube Spinach Says:

TAKE 'EM FISHIN'

I WENT visitin' today, had a real good time an' we all talked of sev'ral things—specially of the number of young fellers 'at was goin' to town to work in factories where wages seem high. Mebbe they look high to some of the boys—mebbe some of 'em's never had any wages—just had what dad has seen fit to hand out to 'em. You know there's lots of dads in this country 'at thinks 'bout all the boys need is work shirts, shoes an' a pair of overalls. With this outfit the boys are all set for work.

If they want a dollar or two dad sez, "My gosh boy, I give you a dollar last month, what'd you do with that?".

Well, now you know our boys are kinder wakin' up if they don't do it naturally, why don't you see there's always a little girl lookin' 'round at tells 'em to spruce up a little an' be somebody. An' the boys are fallin' for it an' they're gettin' tired of workin' for jest bread an' butter, pants an' shirts an' a shoe or two now an' then, an' they're quittin' the farm an' the ol' man jest natcherly wonders what makes 'em so uneasy an' why they want to flock into town.

If you want to keep the boys on the farm you've got to give 'em a chance friends. Boys are brighter'n they wuz when we were boys. We thought a few clothes an' sim'lar wuz more'n enough—it ain't that way now. Boys on the farm want a chance, they want to git out an' spread themselves an' so they go to the city where life looks altogether lovely—'cause they learn their mistake eventually but for the time be'n' it looks fine.

My little boy who happened to be in the gatherin' today, said, "Well daddy, why don't dads take their boys fishin' once in a while?"

Well now do you know that kinda set me thinkin' an' every since I've been home I've been thinkin' 'bout it. Why don't dad take 'em fishin' once in a while? Yes folks, farmer friends why don't you do that? Don't you know that the best way to keep a boy on the farm is to make that farm a lively place? Folks, if our boys go to the city to work its our fault—we haven't given 'em a chance, have we?

We must get the habit. The boys an' girls must have a chance—mebbe they were born an' raised on a farm, had cows milk, hens eggs and real bread an' butter—mebbe solid fried cakes an' coffee—no matter they all want somethin' different. My dear farmer friends, just give the boys an' girls an even share—they'll stay by if the chance is given 'em.—Cordially yours, UNCLE RUBE.

White Diarrhea

Remarkable Experience of Mrs. C. M. Bradshaw in Preventing White Diarrhea

The following letter will no doubt be of utmost interest to poultry raisers who have had serious losses from White Diarrhea. We will let Mrs. Bradshaw tell of her experience in her own words:

"Gentlemen: I see reports of so many losing their little chicks with White Diarrhea, so thought I would tell my experience. I used to lose a great many from this cause, tried many remedies and was about discouraged. As a last resort I sent to the Walker Remedy Co., Dept. 680, Waterloo, Iowa, for their Walko White Diarrhea Remedy. I used two 50c packages, raised 300 White Wyandottes and never lost one or had one sick after giving the medicine and my chickens are larger and healthier than ever before. I have found this company thoroughly reliable and always get the remedy by return mail.—Mrs. C. M. Bradshaw, Beaconsfield, Iowa."

Cause of White Diarrhea

White Diarrhea is caused by the Bacillus Bacterium Pullorum. This germ is transmitted to the baby chick through the yolk of the newly hatched egg. Readers are warned to beware of White Diarrhea. Don't wait until it kills half your chicks. Take the "stitch in time that saves nine." Remember, there is scarcely a hatch without some infected chicks. Don't let these few infect your entire flock. Prevent it. Give Walko in all drinking water for the first two weeks and you won't lose one chick where you lost hundreds before. These letters prove it:

Never Lost a Single Chick

Mrs. L. L. Tam, Burnetts Creek, Ind., writes: "I have lost my share of chicks from White Diarrhea. Finally I sent for two packages of Walko. I raised over 500 chicks and I never lost a single chick from White Diarrhea. Walko not only prevents White Diarrhea, but it gives the chicks strength and vigor; they develop quicker and feather earlier."

Never Lost One After First Dose

Mrs. Ethel Rhoades, Shennandoah, Iowa, writes: "My first incubator chicks, when but a few days old, began to die by the dozens with White Diarrhea. I tried different remedies and was about discouraged with the chicken business. Finally, I sent to the Walker Remedy Co., Waterloo, Iowa, for a box of their Walko White Diarrhea Remedy. It's just the only thing for this terrible disease. We raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."

You Run No Risk

We will send Walko White Diarrhea Remedy entirely at our risk—postage prepaid—so you can see for yourself what a wonder-working remedy it is for White Diarrhea in baby chicks. So you can prove—as thousands have proven—that it will stop your losses and double, treble, even quadruple your profits. Send 50c for a box of Walko, or $1.00 for extra large box—give it in all drinking water for the first two weeks and watch results. You'll find you won't lose one chick where you lost hundreds before. It's a postive fact. We guarantee it. The Leavitt & Johnson National Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of this guarantee. You run no risk. If you don't find it the greatest little chick saver you ever used, your money will be instantly refunded.

Walker Remedy Co., Dept. 680, Waterloo, Iowa

WHITE DIARRHOEA
Kills millions of Chicks each season. **THEY CAN BE SAVED** by using **"FADOIL"**—a guaranteed remedy and preventive. $1 per bottle. Postpaid. Enough to successfully treat 650 Chicks. Your money cheerfully refunded if not satisfactory. Bank reference. You take no chances. Send your order **TO-DAY** and be **INSURED** against loss. Circulars free. Dealers wanted everywhere
FADOIL REMEDY CO., Box 507, Norwalk, Ohio

GREEN LAWN CHIX sent insured parcel post prepaid. Barred Rox, White Rox, R. I. Reds, and Black Minorcas, $16 per 100. Brown Leghorns, English White Leghorns or Anconas $14 per 100. Heavy Broilers $14 per 100. Odds and Ends $13.00 per 100. 5% discount on 500 or 1,000 lots. All varieties 17c each in less than 100 lots. Our 13th year producing high grade chix that please. Our method of shipping positively prevents chilling and crowding and we guarantee 100% live delivery. May, June, July 1c per chix less. Order from this ad and state just when you wish chix sent. A saving to cash customers. Deduct 5% if full cash is sent with order. Reference: Fenton State Bank.

MARKET FLASHES

MARKET SUMMARY

Wheat steady. Other grains quiet with prices firm. Beans easy. Potatoes in fair demand. Receipts of butter and eggs small, demand good and prices steady. Poultry shows no change. Some grades of dressed calves moving while others not wanted. Cattle market is steady and trade active. Certain grades of hogs active, others slow. Sheep quict.

(Note: The above summarized information was received **AFTER** the balance of the market page was set in type. It contains last minute information up to within one-half hour of going to press —Editor.)

FOOTE'S MARKET LETTER

By W. W. Foote

FARMERS are in better condition than a year ago, especially those who are out of debt, and not many Michigan farmers care to sell their farms. Aside from the fact that commodities which the farmer buys have advanced in value more than what he sells, one of the worst features he is up against is the scarcity of farm labor, while wages and helpers demand are higher than many farmers feel able to pay. This results in many farmers doing without extra work except in the harvest time, and the tendency is to cultivate fewer acres and put more land into meadows and pastures.. The labor shortage extends to manufacturing cities, and there is talk of coming legislation opening the way for larger immigration from European countries. Our foreign trade is growing highly satisfactorily, strange to say, in spite of the turmoil over there, and during the last nine months our exports ran $193,818,895 ahead of the corresponding period a year ago. Foreigners are largely paying for what they import with merchandise, and our gold imports for March were only $5, 559, 257, comparing with $23,524,848 in March, 1922. Farmers are buying tractors more extensively because of the lack of farm workers.

Why Wheat Sold Higher

Contrary to predictions of leaders in the wheat market, who for weeks past were bearish on wheat, prices scored substantial advances, these being based upon the old-fashioned law of supply and demand and bad crop reports from the southwestern wheat states, as well as late cold weather in the spring wheat regions of the United States and Canada. While predictions are not always easy to make, it looks now more encouraging for the bulls than the bears, and one of the most surprising factors is the revival in recent weeks of the foreign purchases of United States and Canadian wheat, exports running week after week far ahead of corresponding weeks last year. On the other hand, our exports of corn, oats and rye have undergone a big falling off recently, but the large consumption of corn on farms is a highly important bull factor. The visable wheat supply in this country is larger than a year ago and that of rye is far greater. but corn and oats are in much smaller supply than at that time. May wheat sold the other day on the Chicago Board of Trade at $1.26½, comparing with $1.10⅛ a year ago. May corn at 80 cents, comparing with 61½ cents last year; May oats at 46 cents, comparing with 38 cents last year; and May rye at 86¾ cents, compared with $1.10½ a year ago. Sugar prices have boomed because of wild speculation, while butter prices are off under expectations of larger receipts.

The Cattle Industry

The main strength of the cattle market today lies in the general employment throughout the country of labor at unusually high wages. Still, the profits of stock feeders for the year to date have not been very large as a rule, and this causes many farmers to pause when considering next summer's operations. The spread in beef cattle prices is now very wide, with comparatively few sales around top figures and the bulk of the steers selling on the Chicago market for $8.25 to $10. Common steers have sold at $6.75 and over, good kinds being salable at $9 and upward and the best lots at $9.75 to $10.35, but a few go above $10, with the best yearlings salable at $9.50 to $10.10. In discussing the cattle situation, a leading Chicago live stock commission firm tells its patrons: "It is not a question of available funds for buying, for money may be had; it is the initial cost that hurts. The logical outcome will be less beef later, and with the northwest undoubtedly short of beef cattle, it looks like a rather good time in our opinion to keep in the game." Most of the time fat cows and heifers are having a good sale at $4.50 to $9.25 but not many sell above $8.25. Cattle were largely around 25 cents higher in the Chicago market last week, the best excepted, although there were good receipts. The best steers sold at $10.35, comparing with $9.25 a year ago. Stockers and feeders were slow and lower at $6 to $8 for the general run, no good lots going below $7.25 and the best at $8.25.

Cattle Feeding Propositions

The approaching grazing season warns farmers who are in the habit of preparing beef cattle for the market that it is time to be looking about for thin cattle for feeding; but thus far sales of stockers and feeders in the Chicago market have fallen short of expectations, many stockmen regarding the prices demanded as too high compared with those paid for finished cattle. The general run of stockers and feeders have been bringing $8 and under for good lots, although inferior descriptions have sold as low as $5.50 to $6.50, with many sales of middling kinds at $6.75 to $7. The best feeders are taken at $8.25 to $8.75, these steers being really killers, but they are sent to Mineral Point, Wisconsin, for a short finish. There were around 13 per cent more cattle in feeding districts in the eleven corn belt states on April 1 than a year ago, according to the Department of Agriculture.

Plenty of Hogs

The corn belt states have been bountifully supplied with hogs the past winter and spring, and they have gone to market in vastly increased numbers compared with recent years, Chicago's share being especially large. Fat droves predominate, and recent receipts averaged 241 pounds, the heaviest since last October. Chicago packers receive large supplies of hogs consigned direct from western markets, while eastern packers receive many from Chicago, eastern holdings being moderate in number. Naturally, hogs have sold at lower prices, but the decline has not been as great as might have been expected. Reasonable prices for fresh and cured meats and lard encourage domestic consumption, while exports are running far ahead of a year earlier. For the second week of April exports from North America included 23,712,000 pounds of lard, comparing with 32,193,000 pounds a week earlier and only 6,557,000 pounds a pounds a year ago; as well as 18,-year ago; as well as 18,054,000 pounds of cured hog meats comparing with 21,393,000 pounds a week earlier and 6,557,000 pounds for the corresponding week of 1922. It is a startling fact that during the period from the first of last November to the close of March exports ran 126,396,000 pounds ahead of the corresponding time a year earlier. According to the government reports, the number of brood sows on farms on April 1 was 6.7 per cent more than a year earlier. Uufortunately, large numbers of pigs died because of the cold, wet spring, and this will greatly lower the pig population. Hogs have been selling at $6.50 to $8.40, mainly at $7.60 to $8.30, light lots going highest. Pigs sell at $5.75 to $7.75.

WHEAT

There has been considerable bullish news afloat in the wheat market the past two weeks and during the first week and the forepart of the last week the market was steady to strong but after that it weakened and prices declined. At Detroit the decline for last week amounted to 2½c making the market ½c lower than at the opening two weeks previous. Domestic demand shows some improvement while export business is reported good at some points and slow at others. In general, demand for export seems to show that foreigners are buying only to supply immediate needs. Reports from the country show the fall sown grain is coming along nicely but spring seeding is several weeks behind and in some sections farmers have been unable to get on their ground so far this spring to do any preparing. As a result the 1923 wheat acreage will show a decline over 1922.

Prices

Detroit—Cash No. 2 red, $1.36; No. 2 white, $1.36; No. 2 mixed, $1.36.

Chicago—Cash No. 2 red, $1.32½; No. 2 hard, $1.25@$1.26.

Prices one year ago—Detroit, No. 2 red, $1.41; No. 2 white, $1.38.

CORN

Predictions of a large acreage this year is weakening the corn market, also the declines in wheat prices affected the trend of this coarse grain. Receipts are of good volume amounting to 1,246,000 bu. while shipments were only 540,000 bu. The grain closed steadier last week at Chicago owing to better demand and a decrease in offerings. Should this condition continue the market will undoubtedly take on a better appearance all over the country. There are many friends of this market who believe higher prices are coming.

Prices

Detroit—Cash No. 2 yellow, 88½c; No. 3, 86½c; No. 4, 84½c.

Chicago—Cash No. 2 yellow, 80¼@82c; No. 2 mixed, 80@80¾c.

New York—Cash No. 2 yellow and No. 2 white, $1.00; No. 2 mixed, 99½c.

Prices one year ago —Detroit, No. 2 yellow, 67½c; No. 2, 66c.

OATS

Oats were weak along with other grains and prices declined. Demand is dull while country offerings to arrive are small. Predictions are that the acreage planted to oats this year will be somewhat larger than last year. Oats will be planted in the place of spring wheat on many farms.

Prices

Detroit—Cash No. 2 white, 51½c; No. 3, 50c; No. 4, 48½c.

Chicago—Cash No. 2 white, 46@-46½c; No. 3, 43¾@45¾c.

New York—Cash No. 2 white, 56½c.

Prices one year ago—Detroit, Cash No. 2 white, 43½c; No. 3, 41½c.

RYE

There is little to say about the rye market at the present time as it is unchanged, however, men who make it their business to study the markets anticipate higher prices.

Prices

Detroit—Cash No. 2, 85c.

Chicago—Cash No. 2, 85½@85¾.

Prices one year ago—Detroit, Cash No. 2, $1.09.

BEANS

Without question the Bean and Pea Journal is an authority on the bean market and conditions governing it. The following is taken from the latest issue of that publication. You will note that in the last paragraph that they advocate the same thing we have for some time.

"Talking with two Michigan jobbers, it was found one was distinctly bearish, the other just as distinctly bullish, on the future bean market. A third was inclined to be about half way between, and here's about what he had to say:

" 'Trade has been dull for three weeks. It should be better very soon now, and we look for a decided increase in buying. Foreign beans have hurt somewhat, but there are not any more beans in Michigan than will be needed, when you consider the amount needed for seed. We do not expect the price to fall below what it now is, and it should improve a little before new crop—not much but some.'

"Estimates of stocks on hand in Michigan at this time vary greatly. There are probably more beans here than there were a year ago. But with any normal buying on the part of wholesalers, together with the increased quantity that will be needed for seed, the stocks should not be in excess of requirements.

"California and Michigan control the bean situation this year; other producing states are nearly cleaned out. Imported beans have been coming in and are being bought to some extent, but we do not believe them to be of the quality to establish a real continued demand for them.

"The big need seems to be some organized effort to increase bean consumption. Advertising will do this. Spasmodic attempts of the part of various organizations and firms have invariably resulted in an increased consumption in the territory where it was tried, and there is no reason why, on a national scale, advertising will not bring into being a steady and an increasing demand for beans of the quality kind. We'd like to see this development, and will do all in our power to assist such a movement."

Prices

Detroit—C. H. P., $7.00 per cwt.

Chicago—C. H. P., $7.25@$7.75 per cwt.

Prices one year ago—Detroit, C. H. P., $6.90 per cwt.

POTATOES

The receipts at Detroit continue to be small and prices are firm at higher levels. Chicago has a quiet to dull market with prices unchanged. Reports from the potato growing sections of the country show that the 1923 acreage will be considerable under the acreage of last year. The Maine potato crop in 1922 brought less than one-third of what the crop of 1921 did and the 1923 acreage in that great potato growing state will be smaller, it is stated. However, to what extent the acreage will be cut, it is hard to determine at this time as prices at eastern markets have advanced during the past fortnight which may influence growers to plant more than originally planned.

Prices

Detroit—Michigan, $1.83 per cwt.

Chicago—Wisconsin sacked round white, $1.25 per cwt.; Michigan sacked round white, $1.25@$1.55.

Prices one year ago—Detroit, Michigan, $1.97.

HAY

Bad roads and urgent farm work are restricting the movement of hay and markets generally continue firm under light receipts. Central west offerings are slowing up and southern demand is less active. Lower grades show some tendency to weakness but good grades are firm and steady.

Prices

Detroit—No. 1 timothy, $17.50@$18; standard, $16.50@17; light mixed, $16.50@$17; No. 2 timothy, $15.50@ $16.50; No. 1 clover, mixed, $14@15; No. 1 clover, $13@$14. $14.

Chicago—No. 1 timothy, $21@$22; light mixed, $19@$21; No. 2 timothy, $18@$20; No. 1 clover, $15@$16.

New York—No. 1 timothy, $26; standard, $14@$17; No. 2 timothy, $24@$25; No. 2 light clover mixed, $24.

Prices one year ago—Detroit, No. 1 timothy, $21@$22; standard, $20@$21; No. 2 timothy, $19@20; No. 1 light mixed, $20@21; No.

Clean, Fast Cutting

Kalamazoo
ENSILAGE CUTTERS
The Kalamazoo Ensilage Cutter is the product of long experience. Thousands of enthusiastic users acclaim its superiority. Compare the Kalamazoo before you buy. It gives you more for your money, does the work in less time, with less power, less trouble and makes better ensilage.

Many Superior Features
Have a sturdy lifetime frame of channel steel, unbreakable knife wheel, center shear cut, triple feed rollers that insure steady feeding; reversible shear bar and many other valuable features that will please you. They take the extra big bundles easily and run without vibration, insuring long life.

Backed by a Guarantee that Means Absolute Satisfaction

Alfalfa—Chicago, $16@23; Detroit, $13@17.

WOOL

The midwestern wool trade remains on about a steady basis, with trading rather light on account of smallness of stocks. Reports from the east continue favorable and western dispatches indicate that while buying has been slowed up by the fact that growers are determined to get top or even higher prices, the tone of trade there is still good, with prospects that the growers may succeed, according to the Chicago Daily Drovers' Journal.

Some dealers are less optimistic as to the future trend, but the market as a whole presents a firm appearance.

Quotations on midwestern or so-called "native" wools in large lots—such prices as are obtained by the farmers' pools—are as follows (f. o. b. Chicago): Fine and medium staple, 53@54c; ½ blood staple, 52@54c; ½ blood clothing, 49@50c; ⅜ blood wools, 52@53c; ¼ blood, 50@51c; low ¼ blood, 40@42c; braid, 30@32c. Western ("territory") wools sell, Chicago basis, at about these same prices for corresponding grades.

MISCELLANEOUS MARKET QUOTATIONS

Detroit, Tuesday, April 24th

BUTTER—Best creamery, in tubs, 41@42c per lb.

WEEKLY MARKETGRAM

U. S. Bureau of Agricultural Economics

Washington, D. C., for the week ending April 20, 1923.

FEED: Mill feed markets dull and declining. Demand slow with buyers holding off for lower prices. Withdrawal of recent low quotations by shipping interest for a few important feeds and change to higher basis also affected demand. Gluten feed quoted $1 higher, offerings good, demand fair. Hominy feed firm, offerings light, demand fair. Demand for oil meals very light, prices steady. Good inquiry for transit feeds but deferre deliveries quoted at sharp discounts. Receipts and supplies generally ample. Quoted April 20: bran $26.50, middlings $26.50, flour middlings $28 Minneapolis; 36 percent cotton seed meal $39.50 Memphis, $41 Atlanta; gluten feed $34.65 Chicago; white hominy feed $30.50 St. Louis, $31 Chicago; 32 percent linseed meal $43 Minneapolis, $43 Buffalo.

DAIRY PRODUCTS: Butter markets continue to remain unsettled and very sensitive to old conditions effecting prices. Supplies ample for trade requirements and the added factors of approaching Spring production and necessary quantities which may be inported have had much to do in influencing price tendency which are working downward. Closing prices 92 score butter; New York 44; Pila 44; Boston 44; Chicago 42½c. Despite furthur declines on Wisconsin cheese boards Monday cheese markets continued more or less week and unsettled. Trading shows slight increase in some quarters but on the whole buyers have kept off the market except for necessary requirements. Prices at Wisconsin primary cheese markets April 19: twins 19¾c; Daisies 20½c; double daisies 20¼c; longhorns 20c; sq. prints 20¾c.

PRITCHARD'S
WEATHER
FORECAST
INTERPRETED BY THE STARS

Week of April 29

DURING the early part of the week beginning April 29th we expect Michigan temperatures to average cool. About the first of May, however, temperatures will be rising and will continue above normal for the balance of the week.

We are expecting the rainfall to be plentiful during Tuesday and Wednesday with high winds general and gales on the Great Lakes.

While there may be indications of storminess or even a storm itself about Friday of this week we believe the average conditions from the 2nd to the 6th will be fair and cool. No decided fall in the temperature in Michigan is expected this week but colder conditions will manifest themselves next week.

Week of May 6

With the average weather conditions for the week of May 6th promising to be cold and dry we believe germination and growing vegetation will be retarded. The week offers splendid opportunities for the farmer to rush his field work such as planting early potatoes and seeding his barley and oats. The farmer of the southern counties of Michigan can get his corn fields in shape. If the winds do not destroy the blossoms, pollination should be good among cherry and plum trees since the bees are expected to be active during this period.

Temperatures will be rising at beginning of the week with showers and high winds during middle days. Following the storm the winds will shift to west and north and wax strong at the same time inducing fair weather for the last days of the week with cold temperatures.

MICHIGAN AYRSHIRE BREEDERS PLAN BIG PICNIC

MICHIGAN Ayrshire men are planning the biggest meeting in the breed's history in the state for May fifth. On that date they are the guests of Mr. William H. Murphy at his farm at Birmingham. Features of the day's program are the inspection of Mr. Murphy's dairy buildings and his prize winning herd of Red and Whites and an address by Paul O. Reymann of Wheeling, West Virginia, president of the National Ayrshire Breeders' Association. Breeders from all sections of Michigan will attend and take part in the plans being made for the Ayrshire's further advancement in the state. President W. T. Shuttleworth, Ypsilanti, and Secretary Edward C. W. Roberts, of Fennville, officers of the Michigan Ayrshire Club will have charge of the day's program.

Ayrshires have made notable progress in Michigan during the past eighteen months, particularly since the organization of the State Association in January 1921. The rapidly increasing popularity of the Scottish dairy breed is resulting in the founding of many new herds. One of these is at the Michigan Agricultural College. Professor O. E. Reed last summer selected five animals which average as high in quality as any college herd in America. He bought these animals in the rough at a moderate price and has developed and fitted them so that their milk flow is proving them to be among the leading producers of the breed. There are now one hundred Ayrshire men in the state. That they are doing worth while things is well shown by the interest being taken by the National Association and that the president is coming from West Virginia to take part in the May fifth meeting.

The powerful hold of the Hupmobile upon the American public is not due to any one or two outstanding features.

The Hupmobile is unique today in that it combines within itself, in balanced measure, all the advantages which are worth while in a motor car, and which every motor car buyer always hopes to get when he buys.

In the Hupmobile you obtain, in major degree, dashing appearance, brilliant performance, power, strength and sturdiness, extreme endurance, very low operating cost and long life.

The Hupmobile is uncommon, furthermore, because it can be purchased at a comparatively low price, and re-sold again—when the time for a new Hupmobile finally does arrive—at a comparatively high price.

Current Agricultural News

INCREASED BEAN PRODUCTION SOUGHT

MICHIGAN elevator companies are taking part in a nation-wide campaign to increase the acreage and production of beans in every state to such an extent that the domestic market will not be dependent on foreign grown stock at any time of the year, it was announced today at the state headquarters of the Michigan Elevator Exchange.

The movement was started in the New England states, it is said, and is rapidly being taken up all over the country. It is not to increase the home-consumption of dry beans, the exchange authorities claim, but to make pork-and-beans a national dish in place of corned beef and cabbage.

If enough beans can be produced to care for the normal consumption demands in this country, the shippers claim, the farmers will still be able to get a fair price for his crop and be assured of disposing of all he raises. It is up to the farmer to make his crop the predominating one on his own market, it is said, and to increase production to the point where the foreign producers can not compete in this country.

MASON DAIRYMEN START TESTING

MASON dairymen organized the third Ingham County Cow Testing Association, at a meeting held in Mason week before last. Twenty-six of the leading dairymen of the Mason vicinity joined in the association.

A tester is to be employed who will spend one day a month on one farm of each member, obtaining milk weights, feed weights, and a butter fat test on each individual cow. It is expected that these records will form a basis of judgment as to the producing quality of the cow, and that the undesirable and unprofitable cow may be eliminated from the herds. Better feeding methods will be practiced, it is claimed, through the efforts of the association.

Mason-Ingham Cow Testing Association is the fortieth association to be organized in the state. Ten new organizations are expected to organize in the near future which will bring the Michigan total to fifty.

PLAN DRIVE ON MILK DEALERS NOT LICENSED

PROSECUTION of all milk dealers in Michigan who have not procured their state license is on the program of the dairy department of the state department of agriculture, according an announcement of T. H. Broughton, head of the dairy activities. It is the hope of the department that all 2,700 dealers will be reached before the end of the fiscal year June 30.

Most of the large dealers in the state have obtained the licenses necessary, according to Mr. Broughton, but there are a number of one-man wagons for which licenses have not been issued, and it is to these that the department is turning its attention. The erring dairymen first is given an opportunity to comply with the law, and prosecution is the last resort. Seventeen prosecutions were started during April, according to the records turned into the office here. In the same time but two prosecutions were started for watering milk.

The state also revoked the license of one tester, who was detected giving incorrect readings at one of the cream buying stations.

MICHIGAN LIVE STOCK EXCHANGE PAYS DIVIDEND

LOCAL associations of the Michigan Live Stock Exchange will receive during May a patronage dividend of about $7,000 which the Exchange is paying to associations which have patronized the Live Stock Exchange's Cooperative House at the Detroit stockyards during the past year. The divident is a savings and represents a refund to membre patrons of 10% of all commissions paid to the Exchange for sales service.

The Michigan Exchange established a cooperative commission house at the Detroit yards May 1, 1922. Since then the association has handled 4,129 carloads of stock out of 12,616 sent to market of 30.5% of the total business. The business handled by the Detroit Cooperative Commission House the first year shows a net savings of $17,500, which is a savings of about 25% of the commissions paid for service. The Live Stock Exchange charges the regular commissions. The Exchange voted to return 10% of all commissions paid to members or $7,000. The remainder gives the Live Stock Exchange Commission House a reserve fund on which to do business. It also belongs to the members.

The Live Stock Exchange is the second Michigan community marketing exchange to declare a patronage dividend within the past month. Last week the Michigan Elevator Exchange paid its member associations a patronage dividend of $8,000. The Michigan Potato Growers Exchange has been paying patronage dividends for some time past. The foregoing commodity exchanges are affiliated with the Michigan State Farm Bureau.

CURWOOD BUILDS HIS OWN CASTLE

James Oliver Curwood, Owosso author and naturalist, who is building a studio after the fifteenth century type of castle, has purchased an acre of land across the Shiawassee river from his studio and will set out a minature forest of pines, firs, balsams and spruce.

FARM BUREAU HANDLES MORE SEED FOR 1923

Nearly twice as much certified seed has been handled by the state farm bureau this year as was sold in 1922, it is said, while the amount of certified seed potatoes has increased about 400 per cent over a year ago.

START COLLECTION OF EATON WOOL

The 1923 wool pool of the Michigan State Farm Bureau started assembling of wool for the season at Eaton Rapids on April 30th. A flat advance of 25 cents per pound is made at the time of pooling, with final settlement when pool is sold.

HURON FARM BUREAU SEEKS NEW MEMBERS

"Every Huron farmer a member," is the keynote of the County Farm Bureau Association drive to open July 16. Alfred Bentaal of the state organization outlined the work of the campaign in a talk before the board of directors at their monthly meeting last week. Extensive demonstrations in ditch blasting, stump and stone blowing, using picric acid, will be started by the association soon.

INTERNATIONAL EGG LAYING CONTEST AT M. A. C.

The week ending May 1 completes the first half of the contest and a considerable increase in production is evident. The weeks total reached 3,609 eggs and the total production to date is 71,954. All groups registered an increase, the White Leghorns leading with 61.0%, Anconas second with 54.0%, Barred Rocks third with 46%, Rhode Island Reds, with 43.0%, miscellaneous with 38.0%, White Wyandottes with 29.0%.

Michigan State Highway Department Bulletin No. 46, May 1, 1923—Gravel and macadam roads in the southern part of the state are now in a softened condition and may be easily injured by heavily loaded trucks and busses. To avoid undue damage to these roads county road commissioners have been asked to put forth every effort to protect the roads until they become more settled and safe for normal traffic. The maximum carrying capacity of tires on all vehicles traveling these roads while the frost is coming out of the ground shall be limited to one-half the carrying capacity of the tires as provided by law; and in no case shall a vehicle be operated on the highways when the gross weight exceeds seven and one-half tons.

Legislature Closes Session in War-Like Array

Governor's Veto of Gasoline Tax Brings Retaliation from House so Weight Tax Loses—Senate then Refuses Byrum Income Tax and Possibility of Extra Session Looms

By STANLEY M. POWELL

BITTERNESS BLASTS HOPES FOR CONSTRUCTIVE LEGISLATION

WHEN the smoke of battle has cleared away from the 52nd session of the Michigan State Legislature, legislative observers will probably agree that if it really has been a "do nothing" Legislature, as has been so frequently charged, it is not because the members did not come there with constructive ideas, but because the bitterness which developed over the gas tax, weight tax and the proposed reapportionment of the representative and senatorial districts made constructive cooperation utterly impossible. There seems to be a general sentiment that if the Governor had adopted a little different attitude in his dealings with the Legislature, all this unpleasantness and failure of constructive accomplishment might have been averted.

In some far off Utopia there may some time come such a pure form of representative government that issues will be decided and settled solely on their merits, but that day is not yet. Under present conditions every action seems to be a compromise and especially during the closing days of the session vote swapping and log rolling seems to settle the fate of most of the bills of major importance.

The squabble over the gas tax and the weight tax is a case in point. After the House had attempted to pass the gas tax over the Governor's veto and had displayed a rather cool attitude towards the proposed weight tax for motor vehicles, as favored by Governor Groesbeck, the Senate began to hold up all important House bills. When the House refused to be browbeaten and by a vote of 56 to 41 defeated the weight tax, all hope that the Senate would pass the major House measures was gone. Big bills which were the victims of this unfortunate condition included the Byrum state income tax and the Meggison bill to provide a more just and desirable system of distributing the primary school interest fund. Nearly all of the tax reform measures passed by the House were put to sleep in the Senate as a rebuke to the House for not falling in line behind the weight tax.

In view of this situation the question naturally arises "Why should the House pay such a high price to kill the weight tax?" The answer is rather complicated, but one need not look far to find at least some of the reasons. Rep. Charles Evans in the final debate in speaking in opposition to the bill said, "This has ceased to be a question of a gas tax or a weight tax, it is now a question of whether or not representative government shall prevail in Michigan."

The representatives felt that the weight tax was being forced on them by the Governor after he had arbitrarily vetoed the gas tax which the people seemed to favor strongly. They also objected to the provisions of the bill which placed the administration of the funds under the control of the State Administrative Board. This they regarded as being another effort to build up a strong political machine for the present administration.

THE settlement of many issues during the closing hours of the session brought a fitting climax to what one solon termed "the most nerve-racking legislative session" in his memory. The Governor's automobile weight tax, the income tax, and the proposed new method of distributing the primary school interest fund were leading measures the fate of which was not determined until nearly the final hour of adjournment.

Much of the jam in the legislative machinery was caused by failure of the Senate and the House to reach an agreement over the various items in the more important appropriation bills. As a rule the Senate was more liberal than the House, and desired larger appropriations for the University of Michigan, the Michigan Agricultural College and the general building program for the other state institutions.

As in the closing hours of the many previous sessions, it was a regretable fact that many of the most important issues were not settled entirely upon their merits, log-rolling and vote-swapping seemed to determine the fate of most of the big bills that came up in the closing hours.

Reforestation Promoted

Measures to promote the orderly development of the northern part of the state have received final legislative approval. The Senate concurred unanimously in the action of the House in the passing of the Meggison-Sargant bill to provide a deferred tax on forest growth.

Under the terms of this bill, the owner of any timber lands, or lands chiefly valuable for the growth of timber within this state, may apply to the Commissioner of Agriculture to have such property set apart for the growth of timber. If, after investigation, the application is approved by the Commissioner of Agriculture, the land shall thereafter be taxed at the rate of 5 cents per acre annually.

After a 25 year period the timber would be subject to cutting, under general control of the Commissioner of Agriculture, who would guard against wasteful methods. At this time the owner of the timber would be assessed a tax equal to 25 per cent of the stumpage value of the timber cut, to be paid into the state treasury.

There is a provision in the bill which would prevent it from working a hardship on any local taxing unit. Section 6 of the bill provides that "The State administrative board may, in its discretion, advance to the townships in which any forest reserve lands lie, such sums each year out of the general fund of the state as will compensate them for the amount of taxes which would be collectible from such forest reserve lands had they not been registered."

There was a general feeling that the annual general property tax was not adopted for the production of long-time crops, such as forest products, and that the passage of this bill would go a long way toward the most economical utilization of large areas of northern Michigan, and would do more to promote forest development than large sums invested in paternalistic tree planting by the state.

Land Certification Approved

Another bill sponsored by Rep. Meggison which has for its object the orderly settlement of Michigan farm land was passed by the Senate with but one negative vote. This was the so-called land certification bill which has been promoted by the Development Bureau of the State Department of Agriculture.

The provisions of this measure are entirely optional and no one need have his land certified unless he desires. The owners of worthless land will probably not care to have their holdings subjected to inspection and certification by the State Commissioner of Agriculture. The evident purpose of the bill is to protect those desiring to purchase Michigan land from deceptive practices of unscrupulous land sharks.

M. A. C. Gets Stadium

The proposal to loan money from the general fund of the state to finance the building of a stadium at the Michigan Agricultural College, as favored by Gov. Groesbeck, has passed both branches of the legislature.

The bill provides for the loan of $160,000 from the State to the College for the construction of the initial unit of an athletic stadium. This loan must be repaid in ten equal annual installments beginning in 1924. As far as possible this refund is to be made out of receipts of athletic contests to be held in the proposed stadium.

Defectives to be Sterilized

One of the most sensational debates of the closing hours of the session centered around final passage through the House of Senator Sligh's bill to authorize the sterilization of mentally defective persons. Those who advocated the bill declared that sterilization was the proper treatment for many cases and that it increased both the physical and mental welfare of the individual to "make good" in his local community with the minimum amount of supervision. Rep. Baxter of Grand Rapids, who led the fight for this measure in the House, declared that the enactment of this bill would allow the state officials to release at least one hundred inmates from the institutions for the feeble minded at Lapeer and that 10 percent of those now coming to this institution could be left at large in their home communities if this bill were passed. The great financial saving to the state which would result from the adoption of such a policy was also pointed out by Rep. Baxter.

Discrimination Bill Passes

Senator Bernie L. Case's bill to prevent unlawful discrimination in the purchase of potatoes was amended by the House to include grain and beans and was passed by them 85 to 3. This bill is intended to protect small local private and co-operative elevators and marketing associations from the unfair competition practiced by some old-line dealers. It has been a common practice for a few unscrupulous dealers to temporarily pay more than the market price in towns where a small elevator is trying to get a start in order to freeze out competition. These dealers have been able to pay this higher price for a short time in a few localities because they paid the farmer much less than the market price in localities where they had no competition. Senator Case's bill was drafted by the Michigan State Farm Bureau and had the active support not only of that organization, but also of the Michigan Elevator Exchange and the Michigan Potato Growers Exchange.

Drain Laws Codified

One of the constructive measures enacted during the closing hours of the session was a revision and codification of all the drain laws of the state. This bill repeals a multiplicity of separate and somewhat disconnected acts and provides a simple and workable general drain law for Michigan. There had been no codification of the drain laws for 26 years and conditions were such that a Philadelphia lawyer was required to look up the law regarding any drainage project.

After being involved in one of the most knotty parlimentary tangles which has occurred this session, the general game law, the most interesting feature of which is the protection afforded to quail until 1930, was passed without opposition by a vote of 94 to 0. Rep. Rowe who sponsored this bill has fought hard for its passage for several months, but because of some of the other features of the bill it has had a very stormy time in getting through and was nearly strangled to death by a parliamentary tangle of red tape.

Tax Exemption Banned

After prolonged debate the House passed by a vote of 75 to 16 Senator Sligh's bill to repeal act No. 88, of the public acts of 1909, which exempts from taxation bonds issued by any county, township, city, village or school district. The House has already passed the bill which provide an annual specific tax of 3 mills on such securities, but unless the Senate also passes this measure, municipal securities will be taxed on the ad valorem basis. If the Senate does not pass the three mill tax, probably the Governor will veto the Sligh bill.

Senator Condon's bill to control the possession and sale and use of pistols, revolvers, and guns and to place their sale under strict governmental regulation was killed by the House committee of the whole without a record vote.

Senate Dodges Tax Issues

The Senate has displayed a disposition not to pass any of the important tax revision schemes which have been proposed and sanctioned by the House. Rep. Byrum's state income tax bill has never emerged from the Senate Taxation committee. Geo. C. Watson's bill to limit the tax on real and personal property for state purposes to an increase of not more than 2 per cent a year was defeated in the Senate by a vote of 12 to 17.

This measure appeared in the form of a constitutional amendment which would of necessity have been submitted to the voters for their approval. Senator Horton maintained that such an important tax reform should be submitted to the voters and he declared that he felt confident that they would pass it. In a speech in favor of the bill he said that real estate in Michigan is now bearing practically 80 per cent of the tax burden although it represents but 33 per cent of the total wealth of the state. Rep. Charles Evan's bill to limit in a similar manner taxes imposed on real and personal property for local purposes was postponed from day to day in the Senate and finally referred to the taxation committe for interment, Rep. Manwarring's bill to prevent the spread within the state of contagious dis-

Reforest Michigan Cut-Over Lands

Senator Couzens Urges that Michigan Legislature Take Immediate Steps to Bring About Reforestation

SENATOR JAMES COUZENS

By J. G. HAYDEN
(Washington Correspondent The Detroit News)

POSSIBILITIES for re-foresting the cutover Michigan pine lands will be investigated this summer by the special committee of the Senate which is considering a national reforestation policy, Senator James Couzens announces.

Mr. Couzens, a member of this committee, has returned from a two weeks' trip through lumber regions adjacent to the Gulf of Mexico, where the situation is similar to that in Michigan. He is enthusiastic about the advantages, both industrially and in tax revenue, which effective re-forestation would produce.

Mr. Couzens suggests that the Michigan Legislature should consider immediately the Louisana system of taxing areas being reforested.

How They Do It

The fundamental of the Louisiana law is the reducing of taxes on lands during the unproductive period of re-forestation, the revenue being reimbursed to the state later by a tax of 10 per cent or more on the ultimate lumber yield. In return for this concession, land owners bind themselves not to cut any growing timber until the trees have reached a specified size, and then to limit their cut so that the re-forestation process will be continued permanently.

Originally these Louisiana re-forestation areas were valued for taxation at $1 per acre, but this valuation now has been increased to $3. That is to say, if the state tax rate is three mills to the dollar, the annual tax on the land is 9 cents per acre.

The one serious weakness of the Louisiana law, as developed in the Senate committee hearings, is its failure to provide for dividing the tax revenue between the state and the counties. The law specifies that the contracts between the land owners and the state must be approved by the county boards of supervisors, but fails to allow the counties any part of the revenue.

The counties, in effect, are asked to strike the re-forestation lands from their tax rolls, without any compensatory return. The natural result has been that the country authorities have been slow to approve re-forestation contracts.

Mr. Couzens believes the tax return to the state during the re-forestation process should be limited to a sufficient fund to maintain an adequate conservation system, to provide fire protection and such supervision as is necessary to insure compliance with the contract. The remainder of the current revenue he would turn over to the counties, the state, however, to receive a liberal division of the tax yield when the timber finally is harvested.

Experts who appeared before the committee estimated the amount of denuded timber lands-that is, land from which virtually all of the trees have been removed, and which is not in use for farming and other purposes, at 81,000,000 acres. There also are considerable areas where most of the timber has been removed but sufficient trees left to provide for natural re-seeding. Of the latter sort, all that is necessary for re-forestation, the experts held, is assurance that the lands will be left undisturbed and adequately protected from fire. The general opinion was that 75 per cent of the whole reforestation problem is fire protection.

Cites Benefits

The benefits from reforestation in a state like Michigan, which now is a large importer of lumber, are easy to estimate, Mr. Couzens declared.

"Southern producers told me privately that they start out by placing a value of their timber at $10 per 1000 feet, based on their advantage in shipping cost, as against the Pacific Coast region, which now has the larger part of the virgin forests in the United States," he said. "That is to say, the lumber growers of Louisiana, Florida, and Mississippi can sell their lumber in the North and East on an equality of price with the Westerners, and take an extra profit of $10 per thousand, due to difference in freight rates.

"On lumber grown in the Lower Peninsula of Michigan, and consumed in Detroit and other State cities; of course the advantage in shipping costs would be even greater. It does not require an expert economist to figure, on this basis, the great profit to be derived from re-foresting the barren sand wasts of Northern Michigan, to producers, consuming industries, and the Government treasuries alike.

Revenue Diverted

"In considering re-forestation in Louisiana, the lumbermen early proposed what they termed a "severance tax" of one-half of one per cent, on all property removed from their cut-over areas, including second growth timber, oil and fish. The specific purpose of the tax was to provide a conservation department to guard against fires, and to foster the work.

"The tax, however, proved so profitable that the State Legislature increased it to 2 per cent, and diverted the revenues thus derived to other purposes. At the present time this "severance tax" is providing approximately $2,500,000 annually, most of which is being used for a state university.

"This action obviously was unfair to the lumberman, and illustrates the great obstacle to re-forestation. It is sufficiently difficult, at best, to induce men to invest their money in an enterprise which will not show a profit for a period ranging from 20 to 70 years. When you add to this uncertainty about exactions of the state in taxation during this unproductive period, it is certain no person but a philanthropist would stake his money on the proposition.

The First Essential

"The first essential in promoting re-forestation by private enterprise, obviously is to let the land owner know exactly what the tax will be during the entire period of re-forestation. Lumbermen who appeared before our committee stated that they did not object to a yield tax of 10 per cent, or even higher, if they were assured of nominal taxation while the timber is growing.

"The degree to which many Southern lumber producers are taking up re-forestation, even under existing adverse conditions, was an encouraging feature of our hearings. For instance Bogalousa, La., is a city established in the middle of what, 14 years ago, was a virgin pine forest. The Southern Lumber Company, which is promoting the enterprise, is proceeding on the expectation that, by the time their original timber is cut, they will have grown a new crop, and that they will be able to maintain their business permanently on its present basis.

"We saw a large park in the center of Bogalousa in which were literally hundreds of thousands of little pine trees, ultimately to be transplanted on the cut-over lands. This company is proceeding with re-forestation, both by transplanting and by the natural process of seeding, with every appearance of success."

The committee will resume its investigation in June on the Pacific Coast, and will work eastward, probably arriving in Michigan in August.

The members of the committee which made the trip south, in addition to Mr. Couzens, are Senators Charles L. MeNary, of Oregon; Duncan U. Fletcher, of Florida, and Patrick Harrison, of Mississippi.

HOW SHALL FERTILIZER BE APPLIED FOR POTATOES?

THE question of the proper method of applying fertilizer for potatoes is one on which there is a considerable difference of opinion among potato growers of Michigan. All agree that fertilizer should not come in actual contact with the seed pieces. Some growers prefer to broadcast fertilizer before planting, while others believe that application in the row, either with an attachment on the planter or by means of separate machine, is the proper method. In the light of present information, it is not possible to state definitely which is the best method, but it is possible to point ont the factors that favor one method against another.

When to Broadcast

An occasional failure to secure results from fertilizer on potatoes is an amount. 200 or 300 pounds of fertilizer per acre spread broadcast is a very light application for an intensive crop such as potatoes. The full benefit of the fertilizer is not received until the root system of the crop has covered the entire area between the rows. It has been pretty definitely established by experiments that the fertilizing elements in the soil solution move principally upward and downward in the soil, and that there is very little movement sideways. The young plants therefore can feed only on the plant food in their immediate root zone, which is limited. After the roots have penetrated the entire area of soil between the rows and the plants in the row, all of the fertility in the soil can be drawn upon. By this time, however, the crop has been pretty well established, and the plant food will not have the same efficiency in making the crop as it would have, had it been available to the young plants in giving them a quick vigorous start. Moreover, the full benefit of the fertilizer is not likely to be received, particularly in the case of the nitrogen or amonia. Practically no phosphoric acid and potash are lost from the soil, but nitrogen may be lost very rapidly in leaching and drainage. In the broadcast application of fertilizer containing a small amount of nitrogen the amount of the nitrogen that is actually utilized by a cultivated crop is open to question. The broadcast method of applying fertilizer for potatoes, however, is entirely logical and sound when fairly large amounts of phosphatic or potash fertilizers are applied to build up the soil supply.

Fertilizer in the Row

The methods of eastern growers, particularly in Maine and New Jersey, are worthy of consideration because they represent a practice based on the cumulative experiences of many years of fertilizer usage. In these sections there are two common

(Continued on Page 19)

The Reforestation Possibilities in Michigan

By SENATOR JAMES COUZENS

(Written especially for The Business Farmer)

THE evidence secured by the Senate Committee on Reforestation, which has recently returned from a ten days' trip in the Gulf States, where they held numerous hearings, indicates that the public are generally alive to the necessity of prompt action in promoting the growth of trees. Public interest in this is greater than most of us supposed, and a much greater interest is being manifested every day than the average person believes, and this in itself is a most encouraging condition. This does not mean, however, that there is not a great deal more to be done in an educational way to point out not only the necessity but the advantages to be gained from reforesting our cut-over lands not adaptable for agriculture, and possibly for other lands best adapted for tree-growing.

The two outstanding things to be done to encourage private reforestation are fire protection and stabilization of taxes. It has been quite clearly developed that 75% of the difficulties will be removed when proper fire protection is assured, and then there will be nothing standing in the way, when each state adopts a taxation plan, that will enable the owners of timber lands to reforest. Many states are giving earnest consideration to these matters, and some of them have adopted plans which are most encouraging and from which all states can learn.. The Committee witnessed several activities based on the plan of perpetuating lumber operations. These were based primarily in protecting the cut-over lands, which were showing re-growth, as well as the virgin timber lands. Really, no one actually knows what wonderful accomplishments can be obtained by protecting the forests from fire. Evidences existed everywhere of the damages that fire had done to young growth of timber. These enterprises referred to are not only protecting their holding against fire, but they are taking such of the land that had been denuded previously and planting pine trees. Lands that they are cutting, they are limiting their cuts to trees over 12 inches in diameter, and where the stand is larger than this, they are leaving seed trees, which automatically re-seed the cut-over land, and where protected from fire shows remarkable results. They are establishing large paper mills so as to eliminate every waste possible. They are taking their tree-tops and under-sized part of the tree and using it for pulp purposes. They are conducting their turpentine operations on a scientific basis. One large undertaking at Bogalusa, La., is conducting an operation which is planned for an operation in perpetuity, and they are satisfied that this can be done. The State of Louisiana is pioneering in assisting in the protection and growth of timber by making contracts with private owners on a basis of stabilizing taxes in the parishes or countries at three dollars per acres, which with a thirty mill tax would be nine cents per acre per year. The taxes remain on this basis for ten, fifteen, or twenty years and when the timber is cut off a gross income tax or yield tax is paid to the State government, which tax is used in part for fire protection. Where the land, of course, is more adaptable for agriculture, this is not being done. Many farmers, with large acreage, could, with profit, grow trees on the least valuable of their agricultural land. The State of Michigan, the evidence shows is doing admirable work in the conservation line, but they could do more by studying some of the plans adopted by other States.

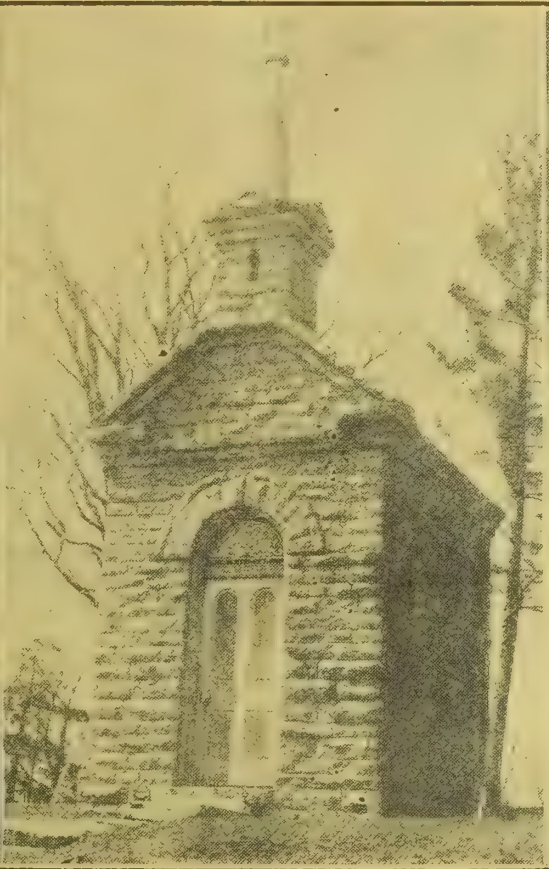
While the Committee has not completed its hearings, and will not for some months to come, I think enough information has developed to show that our people are going to grow forests, and with continued Federal aid and co-operation see to it that our timber supply does not become exhausted.

PICTURES FROM FAR AND NEAR

THE SPEED CHAMPS OF MONKEYLAND.—Left to right: "Man O' War" and "Spark Plug", as they will appear in the monkey race championship to take place at Venice Beach, California, on July 4th. It is to be hoped that the monkeys will not assert their independence and refuse to race—unless more money is assured them. They would be no different than many human professional athletes if they did that.

AWAITING THEIR FATE IN "UNDERTAKERS ROW" HOG ISLAND.—These costly vessels and many others, representing millions of dollars spent feverishly by America during the war, lie idle awaiting a purchaser. Although they are offered at a small fraction of their cost no one will buy. Wouldn't it be better for Uncle Sam to operate them as a merchant marine rather than allow them to rot down?

HIS FIRST BITE IN TWO DAYS.—A ravenously hungry and ragged little Hungarian child who is tasting the stale loaf of bread, the first bite he has had in two days. The poverty stricken populace face starvation and disease unless immediate aid is given.



SMALLEST CHURCH IN THE WORLD.—It is so tiny that only three, besides the preacher, can pray in it at the same time. It is probably fitted to the needs of the congregation. Many years ago a monk named Father Otto built it for his brother devotees at Mount Casino, Kentucky.

HIGHEST PAID WOMAN PLAYER IN WORLD.—Lizzie Murphy, of Eddie Carr's All Star Team, Boston, Mass., who pulls down $300 weekly for her services as a star baseball player. This young lady is a real first sacker and takes her turn at the platter, asking no favors.

THE FALL OF A PRINCE.—The Prince of Wales took a tumble at the water jump in the Army Point-to-Point meet held at Arborfield. Note the "sorrowful" expression on the faces of the bystanders. The Prince of Wales as a sportsman has endeared himself to the people of Great Britian.

PRIEST CONVICTED OF MURDER.—Father Charles Dillon, until April 12th, assistant pastor of St. Augustine's Church at Kalamazoo, Michigan, who has begun serving a life sentence in the state penitentiary at Marquette, for the murder of his superior, Father Henry O'Neill. The convicted man claims that the cruel treatment accorded him drove him to the deed.

AGREEMENT IS BINDING

I am writing for some advice. Some time ago I enrolled with a school of domestic arts and sciences to learn dressmaking. The application blank read as follows:

"I send herewith $5 and agree to pay $5 each and every month hereafter from date of this application until I have aid $65." I find that I am not able to make the payments and I haven't the time to study the lessons. I have written to the school several times and explained it to them, but still they keep writing me for payments. I have aid $15 on the course and have received five lessons. Will you kindly advise me if they can hold me to such an agreement?—Mrs. S. M., Bangor, Mich.

—Such an agreement would be valid, and binding upon both parties. You could not avoid your liability under the contract on the ground that you haven't time to study the lessons.

When you entered into the contract, you agreed to perform certain acts, and in consideration thereof, the company should refuse to send the number of lessons agreed to send, or should otherwise to perform their part of the contract, you would feel that you had a right to hold to their contract. Likewise, when you fail to perform your part of the contract, they should have a right to hold you to your agreement.

The facts you have given me do not indicate that there was any fraud or mistake which would relieve you of your duty to perform, and if the company has done its part under the contract, they could compel you to do your part, or to pay them damages for your failure to do so.

The proper time to consider the nature of your obligation, and whether or not you will be able to perform, is before you attach your signature to the contract. I would admonish you at all times, to think carefully before signing your name to any paper.—Asst. Legal Editor.

NOT RIGHT TO SET TRAPS ON YOUR LAND

I would like to know through the columns of your valuable paper if a neighbor has a right to place a dead carcass and set traps around it on my farm, after I have forbidden him to do so? He claims he can set traps wherever he likes. Thanking you for your trouble I remain.—H. Mc. K., Alpena, Michigan.

—Your neighbor would have no right to go upon your land and set traps without your permission.—Assistant Legal Editor.

THINNING VARNISH STAIN

Will you please inform me thru your columns, how I may properly thin varnish stain? I have a quart can that had not been tightly sealed and has thickened to the consistency of heavy molasses.—Mrs. J. L. P., Curtis, Michigan.

—I would advise that you let the can of stain in a dish of hot water, add about ⅛ to ¼ pint of turpentine. Then thoroughly stir until all dissolved then strain through cheese cloth or a very fine screen.—S. B. Howard, College Painter, M. A. C.

INSURING SCHOOLHOUSE

Our local agent for old line insurance companies tells me the attorney general has made a ruling making it unlawful for us to insure schoolhouse in the Farmers Mutual Insurance Co. Is this true and if so has he the right to do so when the charter of our insurance company gives it the right to insure in Benzie, Manistee and Mason counties? Schoolhouses is enumerated as among the forms of property to be be insured.—J. M.,Bear Lake, Mich.

—The statute authorizing the organization of farmers' mutual insurance companies was amended in 1919, and in its amended form does not include schoolhouses as property that may be insured. As to whether or not this limitation applies to companies already organized, or only to those hereafter organized would depend on the interpretation of the statute. I would suggest that you write to the attorney general's office to ascertain if he has recently made a ruling on this matter.

When a charter is granted to a corporation by the state, it usually contains a provision which reserves to the state the right to repeal it by subsequent legislation.—Asst. Legal Editor.

APPLY TO STATE HIGHWAY COMMISSIONER

Am writing for information as so many others are doing. I live on a mail route where the roads are almost impassable part of the year. At such time it is impossible to get a doctor, were it necessary. There has been no work on this road, of any account, for not less than ten years and which ever way I go must travel over one and one-half miles to reach a good road. Some three years ago $1,000 was voted to repair this road and the money was used elsewhere and we are still wading mud. Have complained to the officials but they are absolutely indifferent and evade the issue. Now, is there anything that can be done to compel those in authority to build a road which will be fairly decent? We do not expect a paved thoroughfare, but would like a square deal. Our highway tax has gone to build goods roads elsewhere. Now would like some of the benefits at home. Is there any way in which we can get it?—A. H. Y., Alma, Michigan.

—If your county or township officials will do nothing apply to the state highway commissioner at Lansing. We are sure he will assist you if possible.—Editor.

PERSONAL PROPERTY

Can manure be moved off rented land? A rents land from B. There was no contract. A feeds his stock on B's land. Can A haul manure off B's place?—Subscriber, Sault Ste Marie, Mich.

—Manure in the barnyard is personal property, and a tenant who furnishes the feed which it was produced from would have a right to remove it.—Assistant Legal Editor.

SIGNERS OF APPLICATION FOR DRAINS

In making application for a county drain or dredge drain how many names are necessary on the application and is it necessary the names should be of those along the banks of the stream to be dredged, or in other words can free holders who pay or are liable to pay but very little tax sign the application and put a dredge through when but a small per cent of land owners along the stream are in favor of such dredge, and in case such a dredge goes thru is it right that those along the stream pay the debt of the tax when free holders miles back sign said petition to put it thru? After the drain is surveyed and blue print out is it possible to stop said drain providing said drain is liable to bankrupt the farmers along the drain?—A. S., Perry, Michigan.

—Section 1 of Chapter 3 of the Drain Law provides that the application for the establishing, widening, deepening or extending of the drain shall be signed by not less than one-half of the freeholders whose lands are traversed by such drain. It is impossible for a taxpayer to stop the construction of the drain if all the proceedings have been regular and in accordance with the provisions of the statute unless the drain commissioner and others interested were willing to discontinue the proceedings.—H. H. Partlow, Legal Adviser, State Highway Deartment.

COULD COLLECT INTEREST

I have a question to ask. I would like to have you to answer through your paper. In October 15, 1918, I entered a contract with a party for the sale of my place. Principal and interest was to be paid every six months, but he has paid only the interest the last two years, and a hard time to get that. I started the contract wrong. He paid $500 down

CHAPTER XXI

FOR a minute, perhaps longer, John Aldous stood staring at the photograph which he held in his hand. It was the picture of Culver Rann—not once did he question that fact, and not once did the though flash upon him that this might be only an unusual and startling resemblance. It was assuredly Culver Rann! The picture dropped from his hand to the table, and he went toward the door. His first impulse was to go to Joanne. But when he reached the door he locked it, and dropped into a chair, facing the mirror in his dresser.

The reflection of his own face was a shock to him. If he was pale, the dust and grime of his fight in the cavern concealed his pallor. But the face that stared at him from out of the glass was haggard, wildly and almost grotesquely haggard, and he turned from it with a grim laugh, and set his jaws hard. He returned to the table, and bit by bit tore the photograph into thin shreds, and then piled the shreds on his ash-tray and burned them. He opened a window to let out the smoke and smell of charring paper, and the fresh, cool air of early evening struck his face. He could look off through the fading sunshine of the valley and see the mountain where Coyote Number Twenty-eight was to have done its work, and as he looked he gripped the window-sill so fiercely that the nails of his fingers were bent and broken against the wood. And in his brain the same words kept repeating themselves over and over again. Mortimer Fitz Hugh was not dead. He was alive. He was Culver Rann. And Joanne—Joanne was not his wife; she was still the wife of Mortimer FitzHugh—of Culver Rann!

He turned again to the mirror and there was another look in his face. It was grim, terribly grim—and smiling. There was no excitement, nothing of the passion and half-madness with which he had faced Quade and Rann the night before. He laughed softly, and his nails dug as harshly into the palms of his hands as they had dug into the sills of the window.

"You poor, drivelling, cowardly fool!" he said to his reflection. "And you dare to say—you dare to think she is not your wife?"

As if in reply to his words there came a knock at the door, and from the hall Blackton called:

"Here's MacDonald, Aldous. He wants to see you."

Aldous opened the door and the old hunter entered.

"If I ain't interruptin' you, Johnny——"

"You're the one man in the world I want to see, Mac. No, I'll take that back; there's one other I want to see worse than you—Culver Rann."

The strange look in his face made old Donald stare.

"Sit down," he said, drawing two chairs close to the table. "There's something to talk about. It was a terribly close shave, wasn't it?"

"An awful close shave, Johnny. As close a shave as ever was."

Still, as if not quite understanding what he saw, old Donald was staring into John's face.

"I'm glad it happened," said Aldous, and his voice became softer. "She loves me, Mac. It all came out when we were in there, and thought we were going to die. Not ten minutes ago the minister was here and he made us man and wife."

Words of gladness that sprang to the old man's lips were stopped by that strange, cold, tense look in the face of John Aldous.

"And in the last five minutes," continued Aldous, as quietly as before, "I have learned that Mortimer FitzHugh, her husband, is not dead. Is it very remarkable that you do not find me happy, Mac? If you had come a few minutes ago——"

"Oh, my God! Johnny! Johnny!"

MacDonald had pitched forward over the table, and now he bowed his great shaggy head in his hands, and his gaunt shoulders shook as his voice came brokenly through his beard.

"I did it, Johnny; I did it for you an' her! When I knew what it would mean for her—I couldn't, Johnny, I couldn't tell her the truth, 'cause I knew she loved you, an' you loved her, an' it would break her heart. I though it would be best, an' you'd go away together, an' nobody would ever know, an' you'd be happy. I didn't lie. I didn't say anything. But Johnny—Johnny, there weren't no bones in the grave!"

"My God!" breathed Aldous.

"There were just some clothes," went on MacDonald huskily, "an' the watch an' the ring were on top. Johnny, there weren't nobody ever buried there, an' I'm to blame—I'm to blame."

"And you did that for us," cried Aldous, and suddenly he reached over and gripped old Donald's hands. "It wasn't a mistake, Mac. I thank God you kept silent. If you had told her that the grave was empty, that it was a fraud, I don't know what would have happened. And now—She is mine! If she had seen Culver Rann, if she had discovered that this scoundel, this blackmailer and murderer, was Mortimer FitzHugh, her husband——"

"Johnny! John Aldous!"

Donald MacDonald's voice came now like the deep growling roar of a she-bear, and as he cried the other's name he sprang to his feet, and his eyes gleamed in their deep sockets like raging fires.

"Johnny!"

Aldous rose, and he was smiling. He nodded.

"That's it," he said. "Mortimer FitzHugh is Culver Rann!"

"An'—an' you know this?"

"Absolutely. Joanne gave me Mortimer FitzHugh's photograph to destroy. I am sorry that I burned it before you saw it. But there is no doubt. Mortimer FitzHugh and Culver Rann are the same man."

Slowly the old mountaineer turned to the door. Aldous was ahead of him, and stood with his hand on the knob.

"I don't want you to go yet, Mac."

"I—I'll see you a little later," said Donald clumsily.

"Donald!"

"Johnny!"

For a full half minute they looked steadily into each other's eyes.

"Only a week, Johnny," pleaded Donald. I'll be back in a week."

"You mean that you will kill him."

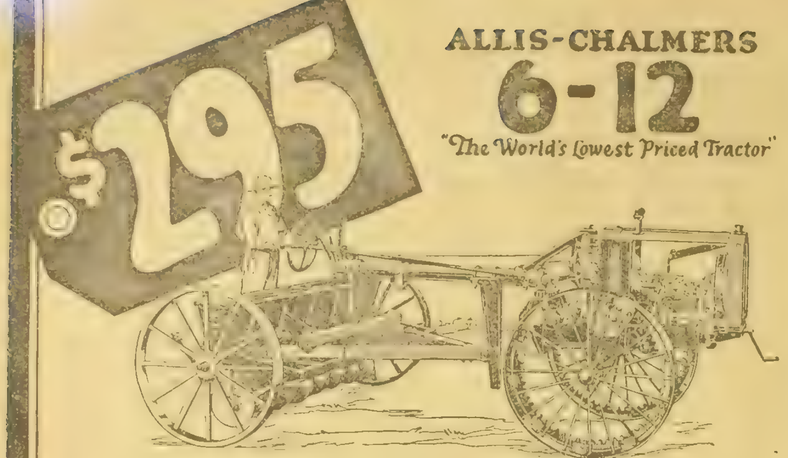
"He'll never come back. I swear it, Johnny!"

As gently as he might have led Joanne, Aldous drew the mountaineer back to the chair.

"That would be cold-blooded murder," he said, "and I would be the murderer. I can't send you out to do my killing, Mac, as I might send out a hired assassin. Don't you see that I can't? Good heaven some day—very soon—I will tell you how this hound, Mortimer FitzHugh, poisoned Joanne's life, and did his worst to destroy her. It's to me he's got to answer, Donald. And to me he shall answer. I am going to kill him. But it will not be murder. Since you have come into this room I have made my final plan, and I shall follow it to the end coolly and deliberately. It will be a great game; and I shall play it happily, because Joanne will not know, and I will be strengthened by her love.

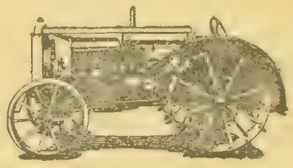
Quade wants my life, and tried to hire Stevens, up at Miette, to kill me. Culver Rann wants my life; a little later it will come to be the greatest desire of his existance to have me dead and out of the way. I shall give him the chance to do the killing, Mac. I shall give him a splendid chance, and he will not fail to accept his opportunity. Perhaps he will have an advantage, but I am as absolutely certain of killing him as I am that the sun is going down behind the mountains out there. If others should step in, if I should have more than Culver Rann on my

(Continued on Page 12)



ALLIS-CHALMERS
6-12
"The World's Lowest Priced Tractor"

Seeding is Just One of 45 Jobs This Tractor Will Do to Perfection



IF interested in a 3 plow tractor, don't buy before getting the facts about the A-C 15-25. You will like its compact, advanced design; its dust-proof housing; its extreme accessibility. Reserve power for deep plowing. Operates 26-in. separator. PRICED BELOW ALL OTHER 3 PLOW TRACTORS OF ITS RATING. A smaller brother to the A-C 20-35 leading 4 plow job of the "grain states."

NEVER in the history of farming has an opportunity like this one been offered. The Allis-Chalmers 6-12 puts speed and thoroughness behind every operation. Hitched to a six or eight foot seeder, you can now put in from 18 to 22 acres during a ten hour day. And this is only one of 45 jobs this tractor will do with the same efficiency. Think it over—can you afford not to own one!

Not a catch price—$295 includes governor, air cleaner, magneto, belt-pulley, and wheel lugs.

4 TIMES Around the World with ONE OILING
100,000 Miles Without Stopping for Oil

An inventor who could develop an automobile, a railroad car or any other conveyance on wheels which would perform such a feat would be considered a wonder. But such is the record of regular accomplishment by the Auto-oiled Aermotor during the past eight years in pumping water.

Did you ever stop to think how many revolutions the wheel of a windmill makes? If the wheel of an Aermotor should roll along the surface of the ground at the same speed that it makes when pumping water it would encircle the world in 90 days, or would go four times around in a year. It would travel on an average 275 miles per day or about 30 miles per hour for 9 hours each day. An automobile which keeps up that pace day after day needs a thorough oiling at least once a week. Isn't it marvelous, then, that a windmill has been made which will go 50 times as long as the best automobile with one oiling?

The **Auto-oiled Aermotor** after 8 full years of service in every part of the world has proven its ability to run and give the most reliable service with one oiling a year. The double gears, and all moving parts, are entirely enclosed and flooded with oil all the time. It gives more service with less attention than any other piece of machinery on the farm. To get everlasting wind-mill satisfaction buy the Auto-oiled Aermotor, the most efficient windmill that has ever been made.

For full information write **AERMOTOR CO.** Chicago Kansas City Dallas Minneapolis Des Moines Oakland

Kalamazoo Ensilage Cutters

Plant Certified Seed for Better Potato Crop

Growers Fail to Realize Amount of Money They Lose Through Planting Diseased Seed Potatoes

By H. C. MOORE
(Assistant Extension Specialist in Potatoes, M. A. C.)

LAST year over 1,000 growers in Michigan planted Michigan Certified Seed Potatoes in comparison with uncertified seed. A summary of the results reported by these men showed that the average increase in yield secured from the certified seed was 45 bushels per acre, and that the quality of the crop grown from certified seed was far superior to that from ordinary seed. Many growers reported that approximately 90 per cent of the potatoes produced from certified seed were marketable while only 60 per cent or so of the crop from uncertified seed could be marketed. In all cases the certified seed was planted under the same conditions and handled in the same manner as the uncertified seed. The reason for the better yield of high quality potatoes from the certified seed was that it was free from serious diseases and was from vigorous high yielding strains, while the uncertified seed was generally infested with disease and was lacking in vigor.

If growers realized how diseases such as mosiac, leaf roll, spindling sprout, etc., reduce the yields and lower the quality of potatoes, they would make every effort to plant nothing but disease free high quality seed. All of the diseases here named live over in the seed potatoes and produce weak hills and plants of abnormal growth which have low yields of poor quality tubers. It is quite common for fields planted with ordinary seed to show 25 per cent or more of these diseases.

The planting of certified seed can be considered a very good form of potato crop insurance for this seed when planted in good soil and grown under good cultural conditions will produce a satisfactory crop of good quality potatoes. Uncertified or ordinary seed potatoes contain a high percentage of diseases and may produce a very poor yield even when grown under the best conditions.

The initial cost of poor seed may be very low but the results it gives in poor yields and poor quality makes it too costly for any potato grower to plant. There is no reason this year for planting poor seed when high quality certified seed is available at very low cost.

In 1922 Michigan growers bought only 22 per cent of the certified seed that was offered for sale in Michigan. Seventy-eight per cent of the seed was sold outside of the state. Pennsylvania last year took 52 cars of Michigan Certified Seed. This seed gave the Pennsylvania planters 50 per cent greater yields than did the uncertified seed with which it was tested. This season Pennsylvania has already bought over 150 cars of certified seed from Michigan.

Ohio, Indiana, Illinois, Maryland, Virginia, Missouri, New Jersey, Connecticut and West Virginia are other states that are buying considerable quantities of Michigan seed potatoes.

Certified potatoes are shipped in bags containing 150 pounds. Each bag is sealed with a lead and wire seal to which is attached the official green tag of the Michigan Potato Producers' Association. Upon receipt of the potatoes they should be emptied from the sack and should be put in a cool well ventilated place where they will not be exposed to frost.

During warm weather seed potatoes are often injured by being left in sacks for several days. If they are spread out on the cellar or barn floor they will not become heated and their sprouts will not be injured.

There has been noted a tendency among growers to be too economical with certified seed. Since the cost of the certified seed is a little greater than that of ordinary seed many of them are apt to cut the seed so that it will cover as large an acreage as possible. Certified seed should be cut so that each "set" weighs approximately 2 ounces. Each seed piece should contain one or two strong eyes. If the sets are cut square or "blocky" they will handle well in the planter and will not dry out quickly in the soil. One should figure on planting 15 bushels or more of seed to the acre.

During the past few months several car loads of certified seed have been bought by Michigan farmers. In some of the counties the farmers have placed their orders for certified seed with their County Farm Bureau, Local Cooperative Associations of local dealers and have thus been able to get the potatoes on the basis of car load rates and have made considerable saving in freight charges.

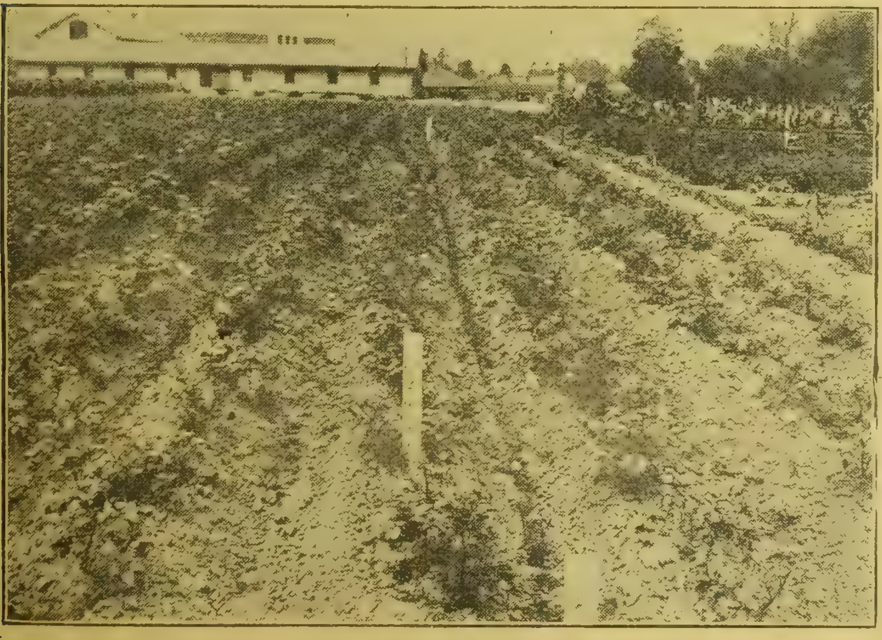
Those interested in securing certified seed potatoes should write to the Secretary of the Michigan Potato Producers' Association, East Lansing, Michigan.

SEEK LIME NEED OF FARMS

FINDING the lime requirements of every farm in the state, in order to take the "guess" out of the important work of liming Michigan soils, is the ambitious program which has been adopted this spring by the soils department at the Michigan Agricultural College.

Accomplishment of the extensive testing operation has been made possible by the perfection of a simple yet accurate method of testing soils, developed by Prof. C. H. Spurway of the college soils staff. This is called the Soiltex Method, and in using it a farmer, or his wife or children, can determine in one short operation whether or not a soil needs lime, and just about how much.

The Soiltex testing outfit, which is distributed from the college soils section on request, contains enough material for at least 200 tests, together with detailed directions.



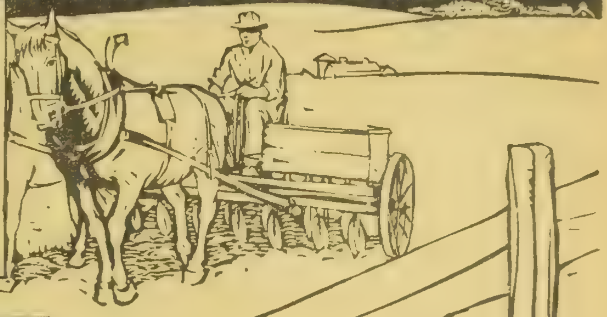
Counting from right to left the first seven rows in the field were planted without fertilizer, the others received proper application. Although one is unable to see the fertilized rows in such a way as to make a proper comparison, you can plainly tell there is a considerable difference.

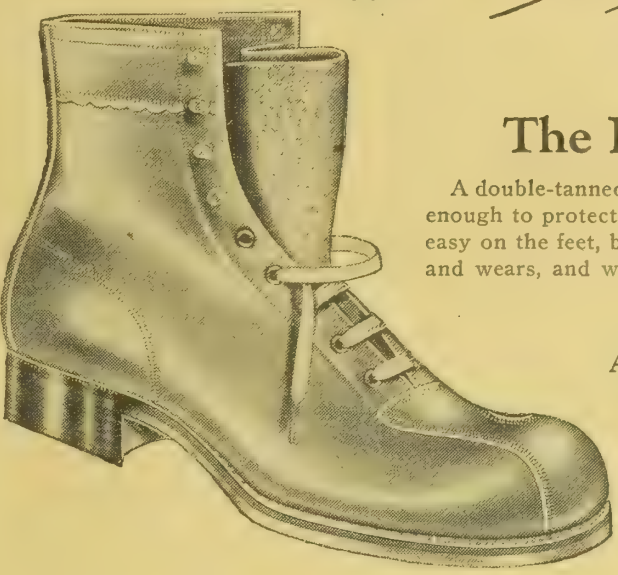
ROUGE REX
More Mileage Shoes
Double-Tanned—Double Wear

It will be three years this Fall since I bought your Rouge Rex shoes and after having put three pairs of new soles on them, they are good yet. I wore them most of the time. They are the best fitting and easiest walking shoes I have ever worn. They are certainly made to stand the wear and tear such as farmers give shoes, and are always soft and pliable summer and winter.

There are six of us and we are all going to buy your shoes. My neighbor asked me when I was going to wear this pair out and I told him that if I knew that I could get another pair, I would do so. He said he would too. Yours truly,

(Signed) WALTER HOFF,
West Saginaw, Mich., R. No. 1
Feb. 13, 1921.





The Planter

A double-tanned horsehide shoe, high enough to protect the ankles. Soft and easy on the feet, but a shoe that wears, and wears, and wears.

Ask for Stock Nos.
4127, 442, 4126

Horsehide—Double Tanned
That Always Stays Soft

We make a specialty of work shoes, made exclusively of double-tanned horsehide. Our double tanning process is an exclusive method of tanning this most durable leather so it always stays soft and pliable as buckskin.

Horsehide is known as the toughest of all leathers. It is the only leather used to cover league baseballs. because it is the only leather tough enough to stand the pounding. We double-tan it, increasing its durability yet making it so flexible that you can wear it all day, day after day, and it never tires your feet.

And it stays soft. Wet it, soak it, wear it through mud and water, it will dry out just as soft as when new. It never grows hard like other leathers.

We use only the choicest horsehides, and we use only the best part of each hide in making the Rouge Rex — the butts, where the fibre is closest and toughest.

Men who have worn Rouge Rex shoes say they never thought leather could last so long, or keep its softness after wetting.

You'll note how thick the leather is in Rouge Rex shoes. Then you'll marvel at its velvet-like flexibility. We make a Rouge Rex 1000 Mile Shoe for every work purpose. For field and factory, for oil field, camp or lumbering. And every shoe is horsehide through and through.

You'll say, after wearing a pair of Rouge Rex, that this is the most economical shoe you ever bought. For it outlasts all other shoes, and it gives the satisfaction of perpetual comfort and ease.

If your dealer hasn't the Rouge Rex we will see that you are supplied through our nearest dealer, Write us for his name.

Rouge Rex
Comfort Shoe

This Rouge Rex is so pliable and soft you can double it up like a moccasin. It wears like iron but you'll hardly know you have a shoe on, it is so soft and easy.

For tender feet, or where you do not encounter wet weather, wear this Comfort Shoe. You'll find it a blessing to the feet.

A Telephone Personality

In your face to face contacts with people, your appearance, your bearing and many other things help you to make the right impression. But in your telephone contacts there is only one thing by which you can be judged—your speech.

An effective telephone personality is to-day a business and social asset. Everybody appreciates the person who speaks distinctly and pleasantly, neither too fast nor too slow, with a clear enunciation of each word, with lips facing the mouthpiece and speaking into it. In business, this is the telephone personality which induces favorable action on the part of the listener. To the salesman it may mean the difference between an order and no order; between an interview granted and an interview refused.

Curiously enough, people who are careful to make themselves effectively heard and understood face to face, often disregard the need for effectiveness in their telephone speech. Perhaps they shout, perhaps they mumble, perhaps they hold the mouthpiece far from their lips. And frequently they never realize that their carelessness has defeated the purpose of their talk.

The Bell System maintains for telephone users the best facilities that science, modern equipment, skilled operation and careful management can bring to telephone speech. But these facilities can be fully effective only when they are properly used.

FRUIT AND ORCHARD

Edited by FRANK D. WELLS

SPRAY RINGS IMPROVE FARM ORCHARD PRODUCTION

THE co-operative spray ring, developed in connection with demonstrations in orchard spraying, is solving the problem of spraying the small home orchard, for an increasing number of farmers, according to reports to the United States Department of Agriculture. While the plan has been used most extensively in Iowa, farmers in Minnesota, Missouri, Wisconsin, Illinois, and Ohio find it a good method, and on the Atlantic Coast several counties in Connecticut and New Jersey organized rings in 1921. In Iowa, the number of counties reporting the organization of spray rings increased from 16 in 1921, to 31 in 1922. Seven counties in Illinois report new spray rings in 1922. Stark County, Illinois, which organized two rings in 1921, has become so interested in the care of the farm orchard that six power-machine rings and five hand-machine rings were organized in the summer of 1922, serving more than 100 home orchards.

The plan of organization of these rings is kept as simple as possible. The men interested in spraying get together at one of the extension meetings and decide to try co-operative spraying. Usually a written agreement covering the method of managing business matters and the ownership of equipment of the ring is prepared and signed. The kind of equipment, hand and power, is selected and the cost apportioned, a schedule is made out, and the members decide whether each man will do his own spraying with the co-operative equipment, whether some one member will spray all the orchards for an agreed labor price, or whether an outside person will be hired to do the work. Each of the three plans has proved satisfactory. In Poweshiek County, Iowa, they have found it most convenient to do the work individually; in Stark County Illinois, the same plan is followed. In Union County, Iowa, the sons of two farmers operated the power machine last season, one furnishing a team and the other a gasoline engine. They sprayed 14 orchards, some 1,500 trees, completing each spray in two days, the members giving little or no attention to the work. Students of Runnells Consolidated School in Polk County, Iowa, sprayed practically all the orchards in their community. Advice as to sprays and time of applying is usually obtained from the county agent.

The size of the ring varies, averaging from 3 or 4 members in the smallest ones to 20 or more in the larger. The cost of operation depends, of course, on several factors, the type of equipment, whether labor is employed or the work done by members for themselves, the distance between orchards, the number of sprays put on, and similar items. For one orchard in Webster County, Iowa, where 4 sprays were applied, the average cost of material per tree was 37c, labor 33c, depreciation on machinery 5c, making a total cost of 75c per tree for the four sprays. A Union County, Iowa, ring spent $210 for equipment, material, and the labor of two men and teams, and sprayed 1,500 trees four times. A twelve-orchard ring organized in Johnson County, Iowa, several years ago, spends about 15c per tree per spray. The results, according to the owners, more than justify the small expenditure. In every case where the spraying was done as advised last season, the work accomplished its object and the members had plenty of clean, sound homegrown apples to store for winter use. The Webster County orchard produced 99 per cent clean fruit. Fayette County, Iowa, reports in the sprayed orchards 75 per cent of the fruit as clean and sound, and 25 per cent scabby and wormy; the unsprayed orchard 15 per cent sound, clean fruit and 85 per cent scabby and wormy. Walworth County, Wisconsin, spray ring members figured in 1922 a return of $852 for each dollar spent in spraying. The bearing trees were sprayed three times.

Results of spray ring work in Hardin County, Iowa, in fact, were so good in 1922 that the disposal of the surplus fruit was a problem, as none of the members had had any experience in picking, packing, or grading apples. Twenty-five men were shown by extension workers how to pick and pack their apples, using homemade equipment, and the surplus apples were put on the market in baskets and boxes packed according to market grades.

COULD COLLECT INTEREST

(Continued from Page 6)

on October 15, 1918, and was to pay $150 every six months thereafter that would make his first payment after April 15, 1919, October 15, 1919. I dated it April 15 to October 15, 1919, but I should have dated it October 15, 1918 to April 15, 1919 therefor, giving him credit as though it was paid in advance. He took a bank mortgage on his place several days ago. I gave him deed and abstract but was unable to collect the last 5 months interest because he says it shows he paid up until April 15, 1923. Would I be able to collect interest under those conditions by going to court? It is written with pen and ink.—A Subscriber, Oakwood, Michigan.

—You say the contract was entered into on Oct. 15, 1918 and required the purchaser to pay $150.00 every six months thereafter. I don't see how that would make this first payment fall due on October 15, 1919, computing the time, as you say, from April 15, 1918.

If the contract was dated Oct. 15, 1918, and the first installment was paid on April 15, 1919, according to its terms, I am of the opinion the interest on this installment could be collected, as well as interest on all other installments which were not actually paid in advance.—Asst. Legal Editor.

RUNS INTO COW

When driving home one evening I ran into a cow with my car. I had good lights, but it was storming, and the cow was not being driven by any one. My car was damaged considerable. Can I collect damage for my car? The cow had been at liberty to run on the road for some time and in all kinds of weather. She ran in front of the car, too close for me to stop. This happened about 10:30 at night.—A. C., Milkado, Michigan.

—There is a statute in Michigan prohibiting owners from letting their cattle run at large on the highways, except in those townships in which it is permitted by the township. If the by-laws of your township do not allow cattle to run at large, I am of the opinion you could collect from the owner of the cow for damages done your car.—Asst. Legal Editor.

SKUNK HIDE TANNING FOR ROBE

Will you please let me know through your next issue how to tan skunk hides for a robe? I am a subscriber and like the paper very much. I am always ready to read when it comes.—G. V., Kingsley, Mich.

—The method recently explained for tanning small fur pelts is all right which is as follows:

Flesh the skins carefully, then soak say two hours in the following liquor: Four gallons of cold, soft water; one-half ounce borax; one half pint salt; one ounce of sulphuric acid. This will prepare the hides for the tanning liquor. Now take two gallons of cold, soft water; one-fourth pound of pulverized oxolic acid; one quart of salt. Put the skins in this and leave them there about two days or until no dense spots are to be seen. When tanned remove the skins, wring them dry, then hang them in the shade and pull and work while drying as this tends to make the hide soft. Skunk hides are usually pretty greasy yet if the hides when working with them appear harsh and dry grease with unsalted butter.

When making the first liquor add the sulphuric acid last, pouring it in slowly and stirring all the time. The quantities of the various articles mentioned are sufficient to tan from six to a dozen skunk hides depending on the size.—Fur Editor.

THE UPPER ROOM REVELATION

A SERMON BY REV. DAVID F. WARNER

Read Acts 1:6-14; 2:1-4.

TEXT: "But ye shall receive power, when the Holy Spirit is come upon you; and ye shall be my witnesses both in Jerusalem, and in all Judea and Samaria, and unto the uttermost parts of the earth."—Acts 1:8.

SUNDAY School folks for six months have been following our Lord to the "upper room." But how many entered? How many joined the inner circle with Peter, James, John, and the rest?

But interest and curosity have led many Oriental travellers to seek the location of the "upper room." Tradition has built there a Christian church. We may not know the site accurately; but we do know the Bible makes the "upper room" a place of more than ordinary interest and significance. And Acts deepens our interest if we understand that this "upper room" is the founding place of corporate Christianity, or the Church. Christianity began when John exclaimed "Behold, the Lamb of God, that taketh away the sin of the world." But the church as spiritually organized and set apart, began in the "upper room" at Pentecost. Here the disciples waited, prayed, and expected until they were endued with a spiritual revelation; the promised power.

This empowering was unto service; unto witnessing. "And they began to speak with other tongues." "O, for a thousand tongues to sing my dear Redeemer's praise." But have you put into faithful use the one tongue you have? Do you remember when you were baptized in the Holy Spirit? Did you feel personally saved? Were you satisfied with that? But we are not to be satisfied until the "uttermost parts" are saved. And now, how about your city—your "Judea and Samaria?"

Well, how may we know when the "uttermost parts" come within the horizon of our spiritual vision and within the reach of our help? The summer days were long and sometimes lonesome in a Michigan grocery store. My merchant friend, being a Christian, prayed "without ceasing." Hours were spent with his Bible. And, lo! one day there rushed in on the plane of his vision the sight of the "uttermost parts;" of sinning, suffering men. He heard the call of God to every man. But for him it meant to live and labor with a foreign folk. And he did. Even so, our horizon is to be extended as to include, sacrifically, "Greenland's icy mountains and India's coral strands." This has to do with vision; and vision has to do with providedness, and prayer. "A Christian on his knees," says Griffith Thomas, "sees farther than a philosopher on his tip-toes."

But, according to our text, we are empowered to witness to the Truth. "What it truth?" The world is ever repeating Pilate's question. Perhaps in no other day has there been such a widened quest for truth. Yet most folks are straddlers. If truth means a sacrifice of comfort, money, prestige, or pleasure, error is more welcome.

But when Christ said "I am the Truth," He did not refer, in the first intention, to what was written in text books, taught in the schools, or worked out in the laboratories. The opinions of men may and do have some truth, but Christ meant originially and now, the truth about the mission and destiny of men, about this life and the next; even the truth about God.

Now, regarding these things, the War brought a decided awakening. Bibles could hardly be made fast enough. The late war may be called one of religions. Or as vice-president Marshall said at the time, "a war between Bethlehem and Berlin." The moral forces of this war revolved about the character of God. Was he a God that had decreed that the masses of men were but chattels to be minipulated at the will of political overlords? Or was he a God who made man in his image and all men equal and brothers? That provided for the healing of the sick, the return of the prodigal, and the deliverance of the oppressed? This is the revealed Truth that we are called to vindicate.

Note the happy abandon in which the early church went to work. What an example of brotherliness! "And the things he possessed was his own ." "There is not one single race of men," said Justin Martyr, in the second century, "whether barbarians or Greeks, or whether they be called nomands or vagrants, or herdsmen dwelling in tents, among whom prayers and giving of thanks are not offered thru the name of the crucified Jesue." What magnanimous surrender to Truth! And in our day a missionary who was offered a threefold increase in salary to teach school, declined, saying "China must have the Gospel tho I starve." This is the kind of service that impresses one as devotion to Christian truth.

Does devotion to others pay? A little Welsh boy lay dangerously ill. The mother walked five miles in the night to get a doctor. The physician hesitated. "Will it pay," said he to himself. "If the baby gets well he will be but a poor laborer." But professional duty conquered and he went. The boy got well and became Lloyd George of England. Did it pay to save a prime minister, who in the time of a world crisis, made a passionate public appeal for the ushering in of the reign of the Prince of Peace on earth? Our Lord's call to every man out of this night of world confusion, is a faithful discharge of duty as Truth lights the way, and some day he shall understand it paid.

Yes, Christ is the truth. Yet, as a religious leader, he was the most calamitous failure the world has ever known; measured by the standards of his own generation. Why? Because of his adherence to Truth. "To this end have I been born, that I should bear witness to the truth," said he. (And so have you my friend). But measured in the thought of our own generation, this man is irresistable as the incarnate truth of God. To be sure, there is yet much error and a lot of pharisaism and hypocrisy. What is hypocrisy? It is burlesqueing truth before the world. It is making life a stage performance. And every man who is ambitious for his OWN success, has fallen heir to this temptation. But Jesus was not anxious for personal success nor desirous of a broad field. He cared only to be an uninterrupted channel of truth. He knew he possessed the gift of a world redemption, and unparalleled power to achieve it. He knew men stood in crying need of the personal and social salvation that he, only, could provide. (And they do yet.) So he must witness to this truth, though he had to pronounce some of the church leaders of the day as snakes, liars, and murderers; and lose the understanding and sympathy of friends. And were he to make a second advent today, can you imagine what he would say to quarreling church factions, unsocial religious leaders, and all the enemies of revealed truth?

At Camp McArthur, a regiment was at the depot to entrain for France. A good, but very ordinary man who had helped the soldier boys much, was there. He asked the commanding officer if he might pray for the boys? He did so while all was quiet. Then, stepping forward, the officer said, "Men, I have never been a Christian, but I want here and now to acknowledge my allegiance to Jesus Christ as my Lord and Savior."

This man of just the common garden variety, had been in the "upper room" with Christ. And true to its demands he became a living witness to Truth as he had experienced it, robbing life of hell in his own narrow field.

Are you ready to stand, my friends, along side of Him, who through living in the midst of error and hypocrisy, even among a set of despicable liars and murderers, stood calm and reposed upon the impregnable rock of truth? You will find power in the "upper room."

"I built my soul an upper room,
  A place of prayer;
Where, free from all disturbances,
  From doubt and care,
Serene it rests. And thou, dear Christ
  Art always there.

God grant that when I leave this room
  For tasks below;
The peace that I have found may from
  My spirit flow,
'Till those I meet build upper rooms
  And thither go."

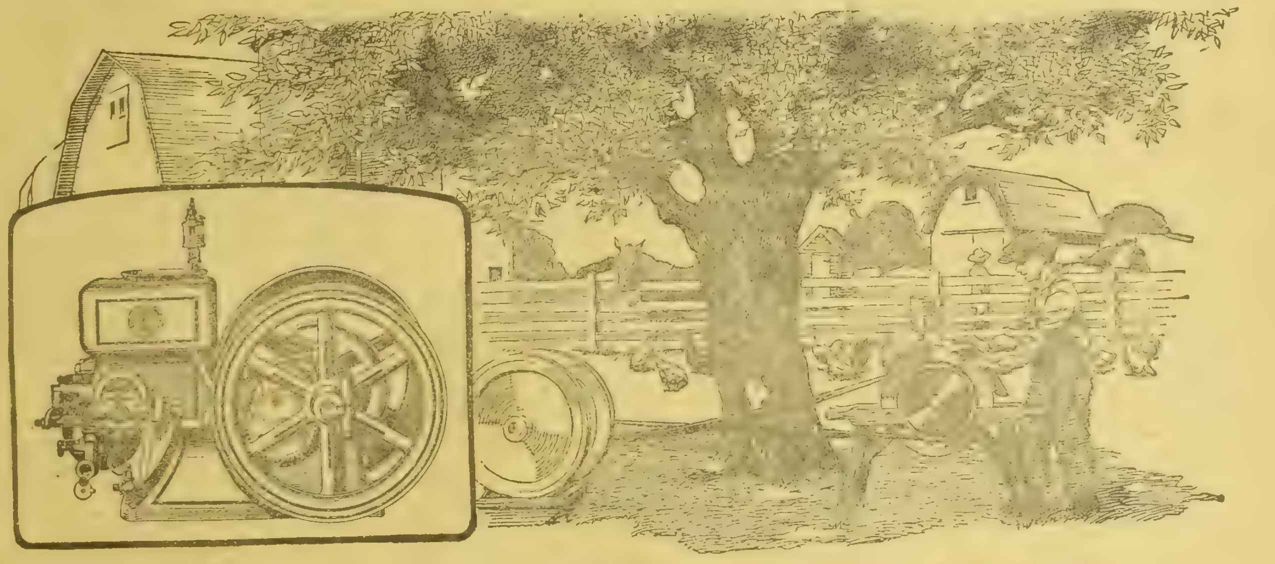
GRAIN CROPS OF ARGENTINA

FIRST official estimates of 1922-1923 grain production in the Argentine have just been received by the Department of Commerce from Consul General W. Henry Robertson and shows a production of 5,281,718 metric tons of wheat, 1,175,575 tons of linseed, oats, 793,484, barley, 130,171 and rye, 64,197. While there is a natural variation in the yields of the various provinces, the whole crop of grains is thought to be satisfactory.

A LAUDIBLE AMBITION

"I want to do something big and clean before I die."

"Wash an elephant."—News from Home.



"The best hired help I ever had"

WATSON RISELEY, of Wittenberg, N. Y., is one of many farmers who are making a Hercules pay for itself over and over again in wages saved and in fuel. A year ago he bought his Hercules, expecting to use it only for sawing and threshing.

"However," he writes, "I have found that it does my work so easily and relieves me of so many chores that I had to do before, that I have time to help my neighbors with their work. This engine is the best hired help I ever had. Uncomplaining, economical, it gives me time to use it to my profit."

Mr. Riseley's Hercules exceeded his expectations. He bought it for a definite purpose. Then he found that there were scores of jobs that the Hercules could do better, more quickly and more easily than they had ever been done before.

The latest type of magneto is part of the Hercules' equipment, eliminating entirely all fussing with batteries. Rain, shine or snow it keeps the engine on the job. Weather conditions have no effect on it. A boy can start and operate the Hercules. You can get your Hercules with either magneto or battery. We recommend the magneto equipment.

It costs no more to own a Hercules. In fact the price is less than most standard types of engines. They range in size from 1½ to 12 H. P. And behind every one is the five-year guarantee of The Hercules Corporation.

There is a Hercules dealer near you. If you can't find him drop us a postal. Let us tell you how the Hercules will do the drudgery on *your* farm.

If Ruptured Try This Free

Apply it to Any Rupture, Old or Recent, Large or Small and You are on the Road That Has Convinced Thousands

Sent Free to Prove This

Anyone ruptured, man,. woman or child, should write at once to W. S. Rice, 408B Main St., Adams, N. Y., for a free trial of his wonderful stimulating application. Just put it on the rupture and the muscles begin to tighten; they begin to bind together so that the opening closes naturally and the need of a support or truss or appliance is then done away with. Don't neglect to send for this free trial. Even if your rupture doesn't bother you what is the use of wearing supports all your life? Why suffer this nuisance? Why run the risk of gangrene and such dangers from a small and innocent little rupture, the kind that has thrown thousands on the operating table? A host of men and women are daily running such risks just because their ruptures do not hurt nor prevent them from getting around. Write at once for this free trial, as it is certainly a wonderful thing and has aided in the cure of ruptures that were as big as a man's two fists. Try and write at once, using the coupon below.

THE HUNTED WOMAN

(Continued from Page 8)

hands—why, then you may deal yourself a hand if you like, Donald. It may be a bigger game than One against One."

"It will," rumbled MacDonald. "I learned other things this afternoon, Johnny. Quade did not stay behind. He went with Rann. DeBar and the woman are with them, and two other men. They went over the Lone Cache Pass, and this minute are hurrying straight for the headwaters of the Parsnip. There are five of 'em—five men."

"And we are two," smiled Aldous. "So there is an advantage on their side, isn't there, Mac? And it makes the game most eminently fair, doesn't it?"

"Johnny, we're good for the five!" cried old Donald in a low, eager voice. "If we start now——'

"Can you have everything ready by morning?"

"The outfit's waiting. It's ready now, Johnny."

"Then we'll leave at dawn. I'll come to you to-night in the coulee, and we'll make our final plans. My brain is a little muddled now, and I've got to clear it, and make myself presentable before supper. We must not let Joanne know. She must suspect nothing—absolutely nothing."

"Nothing," repeated MacDonald as he went to the door.

There he paused and, hesitating for a moment, leaned close to Aldous and said in a low voice:

"Johnny, I've been wondering why the grave were empty. I've been wondering why there weren't somebody's bones there just to give it the look it should 'a' had, an' why the clothes were laid out so nicely with the watch an' the ring on top!"

With that he was gone, and Aldous closed and relocked the door.

He was amazed at his own composure as he washed himself and proceeded to dress for supper. What had happened had stunned him at first, had even terrified him for a few appalling moments. Now he was superbly self-possessed. He asked himself questions and answered them with a promptness which left no room for doubt in his mind as to what his actions should be. One fact he accepted as absolute; Joanne belonged to him. She was his wife. He regarded her as that even though Mortimer FitzHugh was alive. In the eyes of both God and man FitzHugh no longer had a claim upon her. This man, who was known as Culver Rann, was worse than Quade, a scoundrel of the first water, a procurer, a blackmailer, even a murderer—though he had thus far succeeded in evading the rather loose and poorly working tentacles of mountain law.

Not for an instant did he think of Joanne as Culver Rann's wife. She was his wife. It was merely a technicality of the lay—a technicality that Joanne might break with her little finger—that had risen now between them and happiness. And it was this that he knew was the mountain in his path, for he was certain that Joanne would not break that last link of bondage. She would know, with Mortimer FitzHugh alive, that the pledge between them in the "coyote," and the marriage ceremony in the room below, meant nothing. Legally, she was no more to him now than she was yesterday, or the day before. And she would leave him, even if it destroyed her, heart and soul. He was sure of that. For years she had suffered her heart to be ground out of her because of the "bit of madness" that was in her, because of that earlier tragedy in her life—and her promise, her pledge to her father, her God, and herself. Without arguing a possible change in her because of her love for him, John Aldous accepted these things. He believed that if he told Joanne the truth he would lose her.

His determination not to tell her, to keep from her the secret of the grave and the fact that Mortimer FitzHugh was alive, grew stronger in him with each breath that he drew. He believed that it was the right thing to do, that it was the honorable and the only thing to do. Now that the first shock was over, he did not feel that he had lost Joanne, or that there was a very great danger of losing her. For a moment it occurred to him that he might turn the law upon Culver Rann, and in the same breath he laughed at the absurdity. The law could not help him. He alone could work out his own and Joanne's salvation. And what was to happen must happen very soon—up in the mountains. When it was all over, and he returned, he would tell Joanne.

His heart beat more quickly as he finished dressing. In a few minutes more he would be with Joanne, and in spite of what had happened, and what might happen, he was happy. Yesterday he had dreamed. To-day was reality—and it was a glorious reality. Joanne belonged to him. She loved him. She was his wife, and when he went to her it was with the feeing that only a serpent lay in the path of their paradise—a serpent which he would crush with as little compunction as that serpent would have destroyed her. Utterly and remorselessly his mind was made up.

The Blacktons' supper hour was five-thirty, and he was a quarter of an hour late when he tapped at Joanne's door. He felt the warmth of a strange and delightful embarrassment flushing his face as the door opened, she stood before him. In her face, too, was a telltale riot of colour which the deep tan partly concealed in his own.

"I—I am a little late, am I not, Joanne?" he asked.

"You are, sir. If you have taken all this time dressing you are worse than a woman. I have been waiting fifteen minutes!"

"Oid Donald came to see me," he apologized. "Joanne——"

"You mustn't, John!" she expostulated in a whisper. "My face is afire now! You mustn't kiss me again until after supper——"

"Only once," he pleaded.

"If you will promise—just once ——"

A moment later she gasped:

"Five times! John Aldous, I will never believe you again as long as I live!"

They went down to the Blackton's, and Peggy and Paul, who were busy over some grownig geraniums in the dining-room window, faced about with a forced and incongruous appearance of total oblivion to everything that had happened. It lasted less than ten seconds. Joanne's lips quivered. Aldous saw two little dimples at the corners of her mouth fighting to keep themselves out of sight—and then he looked at Peggy. Blackton could stand it no longer, and grinned broadly.

"For goodness sake go to it, Peggy!" he laughed. "If you don't you'll explode!"

The next moment Peggy and Joanne were in each other's arms, and the two men were shaking hands.

"We know just how you feel," Blackton tried to explain. "We felt just like you do, only we had to face twenty people instead of two. And you're not hungry. I'll wager that. I'll bet you don't feel like swallowing a mouthful. It had that peculiar effect on us, didn't it, Peggy?"

"And I—I almost choked myself," gurgled Peggy as they took their places at the table. "There really did seem to be something thick in my throat, Joanne, dear. I coughed and coughed and coughed before all those people until I wanted to die right there! And I'm wondering—"

"If I'm going to choke, too?" smiled Joanne. "Indeed not, Peggy. "I'm as hungry as a bear!"

And now she did look glorious and self-possessed to Aldous as she sat opposite him at that small round table, which was just fitted for four. He told her so when the meal was finished, and they were following the Blacktons into the front room. Blackton had evidently been carefully drilled along the line of a certain scheme which Peggy had formed, for in spite of a negative nod from her , which signified that he was to wait a while, he pulled out his watch, and said:

"It isn't at all surprising if you people have forgotten that to-morrow is Sunday. Peggy and I always do some Saturday-night shopping, and if you don't mind, we'll leave you to care for the house while we go to town. We won't be gone more than an hour."

A few minutes later, when the door had closed behind them, Aldous led Joanne to a divan, and sat down beside her.

"I couldn't have arranged it better

myself, dear," he exclaimed. "I have been wondering how I could have you alone for a few minutes, and tell you what is on my mind before I see MacDonald again to-night. I'm afraid you will be displeased with me, Joanne. I hardly know how to begin. But—I've got to."

A moment' uneasiness came into her eyes as she saw how seriously he was speaking.

"You don't mean, John—there's more about Quade—and Culver Rann?"

"No, no—nothing like that," he laughed, as though amused at the absurdity of her question. "Old Donald tells me they have skipped the country, Joanne. It's not that. It's you I'm thinking of, and what you may think of me a minute from now. Joanne, I've given my word to old Donald. He has lived in my promise. I've got to keep that promise—I must go into the North with him."

She had drawn one of his hands into her lap and was fondling it with her own soft palm and fingers.

"Of course, you must, John. I love old Donald."

"And I must go—soon," he added.

"It is only fair to him that you should," she agreed.

"He—he is determined we shall go in the morning," he finished, keeping his eyes from her.

For a moment Joanne did not answer. Her fingers interweaved with his, her warm little palm stroked the rough back of his hand. Then she said, very softly:

"And why do you think that will displease me, John, dear? I will be ready!"

"You!"

Her eyes were on him, full, and dark, and glowing, and in them were both love and laughter.

"You dear silly John!" she laughed. "Why don't you come right out and tell me to stay at home, instead of—of—'beating 'round the bush'—as Peggy Blackton says? Only you don't know what a terrible little person you've got, John. You really don't. So you needn't say any more. We'll start in the morning—and I am going with you!"

In a flash John Aldous saw his whole scheme shaking on its foundation.

"It's impossible—utterly impossible!" he gasped.

"And why utterly?" she asked, bending her head so that her soft hair touched his face and lips. "John have you already forgotten what we said in that terrible cavern—we told ourselves we would have done if we had lived? We were going adventuring, weren't we? And we are not dead—but alive. And this will be a glorious trip!—Why, John, don't you see, don't you understand? It will be out honeymoon trip!"

"It will be a long, rough journey," he argued. "It will be hard—hard for a woman."

With a little laugh, Joanne sprang up and stood before him in a glow of light, tall, and slim, and splendid, and there was a sparkle of beautiful defiance and a little of triumph in her eyes as she looked down on him.

"And it will be dangerous, too? You are going to tell me that?"

She came to him and rumpled up his hair, and turned his face up so that she could look into his eyes.

"Is it worse than fever, and famine, and deep swamps, and crawling jungles?" she asked. "Are you going to encounter worse things than beasts, and poisonous serpents, and murderous savages—even hunger and thirst, John? For many years we dared those together—my father and I. Are these great, big, beautiful mountains more treacherous than those Ceylon jungles from which you ran away—even you, John? Are they more terrible to live in than the Great African Desert? Are your bears worse than tigers, your wolves more terrible than lions? And if, through years and years, I faced those things with my father, do you suppose that I want to be left behind now, and by my husband?"

So sweet and wonderful was the sound of that name as it came softly from her lips, that in his joy he forgot the part he was playing, and drew her close down in his arms, and in that moment all that remained of the scheme he had built for keeping her behind crumbled in ruin about him.

Yet in a last effort he persisted.

"Old Donald wants to travel fast—very fast, Joanne. I owe a great deal to him. Even you I owe to him—for he saved us from the 'coyote.'"

"I am going, John."

"If we went alone we would be able to return very soon."

"I am going."

"And some of the mountains—it is impossible for a woman to climb them!"

"Then I will let you carry me up them, John. You are so strong—

He groaned hopelessly.

"Joanne, won't you stay with the Blacktons, to please me?"

"No. I don't care to please you."

Her fingers were stroking his cheek.

"John?"

"Yes."

"Father taught me to shoot, and as we get better acquainted on our honeymoon trip I'll tell you about some of my hunting adventures. I don't like to shoot wild things, because I love them too well. But I can shoot. And I want a gun!"

"Not a toy—but a real gun," she continued. "A gun like yours. And then, if by any chance we should have trouble—with Culver Rann—"

She felt him start, and her hands pressed harder against his face.

"Now I know," she whispered. "I guessed it all along. You told me that Culver Rann and the others were after the gold. They've gone—and their going isn't quite 'skipping the country' as you meant me to understand it, John Aldous! So please let's not argue and more. If we do we may quarrel, and that would be terrible. I'm going. And I will be ready in the morning. And I want a gun. And I want you to be nice to me, and I want it to be our honeymoon—even if it is going to be exciting!"

And with that she put her lips to his, and his last argument was gone.

Two hours later when he went to the coulee, he was like one who had come out of a strange and disturbing and altogether glorious dream. He had told Joanne and the Blacktons that it was necessary for him to be with MacDonald that night. Joanne's good-night kiss was still warm on his lips, the loving touch of her hands still trembled on his face, and the sweet perfume of her hair was in his nostrils. He was drunk with the immeasurable happiness that had come to him, every fibre in him was aquiver with it—and yet, possessed of his great joy, he was conscious of a fear; a fear that was new and growing, and which made him glad when he came at last to the little fire in the coulee.

He did not tell MacDonald the cause of this fear at first. He told the story of Mortimer FitzHugh and Joanne, leaving no part of it unbared, until he could see Donold MacDonald's gaunt hands clenching in the firelight, and his cavernous eyes flaming darkly through the gloom. Then he told what had happened when the Blacktons went to town, and when he had finished, and rose despairingly beside the fire, Donald rose, too, and his voice boomed in a sort of ecstasy.

"My Jane would ha' done likewise," he cried in triumph. "She would that, Johnny—she would!"

"But this is different!" groaned Aldous. "What am I going to do, Mac? What can I do? Don't you see how impossible it is! Mac, Mac—She isn't my wife—not entirely, not absolutely, not in the last and vital sense of being a wife by law! If she knew the truth, she wouldn't consider herself my wife; she would leave me. For that reason I can't take her. I can't. Think what it would mean!"

Old Donald had come close to his side, and at the look in the gray mountaineer's face John Aldous paused. Slowly Donald laid his hands on his shoulders.

"Johnny," he said gently, "Johnny, be you sure of yourself? Be you a man, Johnny?"

"Good heaven, Donald. You mean ——"

(Continued in May 26th Issue)

THE WRONG MAN

A rookie was reading an article about the kaiser which compared him to Nero. "Who was Nero, Bill?" he asked a fellow rookie. "Wasn't he a man that was always cold?"

"Naw," was the reply, "that was Zero, another guy altogether."

A NORWEGIAN BOY'S ESSAY ON THE FROG

"What a wonderful bird the frog are
When he stand he sit, almost;
When he hop, he fly, almost;
He ain't got no sense, hardly;
He ain't got no tail, hardly either.
When he sit, he sit on what he ain't got, almost."

Oakland Owners
praise Oakland Dependability

My car has run 17,857 miles. The car has not cost me one cent for upkeep.
Edith E. Harper
San Francisco, Cal.

Up to date I have driven my car 21,000 miles. I have averaged 20 miles or better per gallon of gasoline.
W. L. Kirkpatrick
Minneapolis, Minn.

This car has stood up under all kinds of adverse road conditions. I consider it the best light six on the market.
Justin G. Mayers
Chicago, Ill.

This is the eighth car I have owned and am glad to state that I have been more pleased with the Oakland than any other.
W. A. Lang
Racine, Wis.

I purchased my car March 1, 1922, and up to the present time have run 21,500 miles without grinding the valves or cleaning the carbon.
George O. Dilling
Altoona, Pa.

We made the trip to Los Angeles (3,625 miles) in 20 days. No trouble or breakage on road, except two punctures.
Harold Hunt
Lowell, Mass.

VERIFY for yourself the dependability and economy reflected by these letters.

Ask any Oakland owner what he thinks of his car.

Step into an Oakland showroom and get the new booklet "Evidence" which gives these letters, and scores of others,—typical examples of the hundreds in our files.

Do you wonder that Oakland is able to give a written 15,000 mile engine guarantee, not duplicated by any other manufacturer, and in the "Mileage Basis Plan" offers you a definite gauge by which to measure actual car value!

"The Farm Paper of Service"

AGRICULTURAL OUTLOOK GOOD

WASHINGTON, May 5, 1923.—The general agricultural outlook now is probably the best it has been in three years says the United States Department of Agriculture in its regular monthly review issued to-day. The domestic market for farm products is reported to have improved measurably as a result of increased prosperity in urban communities, but that the prospective foreign demand for American farm products is not as good this year as it was a year ago.

"When labor is fully employed and wages high," the department says, "farm products find a readier sale and better prices. This is what has helped to sustain the price of hogs this spring,, likewise lambs, cattle, dairy products, eggs, and certain vegetables."

THE SAME OLD STORY

OF course it had to happen! They had been in session so long, and tried to do so much! But Governor Groesbeck vetoed the gasoline tax bill, (which had passed both houses with enough votes to prove that the legislature knew what they wanted) and of course, any measure which he would sponsor must be assassinated and promptly buried by the "bitter-enders."

And that was exactly what did happen in Lansing last Saturday.

The House voted down the Smith Automobile Weight Tax Bill by a vote of 56 to 41, and in so doing they sacrificed their own two pet measures, the Byrum Income Tax and the Meggison Primary School Fund Bill, because everyone knew that if the House voted down the Weight Tax Bill, the Senate would get immediate revenge in refusing the passage of the two bills mentioned.

Now it appears that in order to complete, or even to keep abreast of the highway requirements of the state, it will be necessary for the Governor to call an extra session, and before long, because the people of Michigan will demand that the expensive road system now completed be maintained, and that some of the uncompleted units in the state trunk lines be filled in.

The Business Farmer is still convinced that the most profitable of public improvements is the building of good roads, and that the maintenance of these roads is important, but we are equally convinced that some method of taxation must be arrived at, which will make those who use the roads pay the greater part of their upkeep, whether this should come from a gasoline tax, as it does in a great many states, or from an increased weight tax, is in our opinion of lesser importance than that we tolerate no costly procrastination in our good roads program.

Whether we must have a gasoline tax or a weight tax to make the automobile owner pay the greater part of the good roads tax, the fact remains that the people of Michigan will not permit this vital question to go unanswered, and it is regrettable that to answer it, the state must now be put to the expense of an extra legislative session, simply because of stubbornness.

DOCTOR FRIDAY STILL OPTIMISTIC!

DAY by day, in every way, Dr. Friday, President of the Michigan Agricultural College, becomes more convinced that the present trend of farmer boys and farm labor to the city, attracted there by the high prices paid in the automobile and other industrial plants, will in the end rebound to the improvement of agricultural conditions in Michigan and other states.

An interview just published quotes Dr. Friday as saying that present conditions "are merely verifying what I have been predicting all along, that the balance will soon be restored between the cost of what a farmer has to buy and the price he will receive for his products. And they indicate, also, that the coming season is to be one of great prosperity for the young men who are willing to remain on the farm and can produce within their own labor resources; granting, of course, that they grow crops that are in demand here in Michigan."

Probably no man in America enjoys a higher reputation than Dr. Friday as an economist, and after all, an economist is only a prophet of future conditions, based on past experience. Michigan is indeed fortunate to have such a man at the head of its agricultural college, and whether or not the average farmer has in the past believed in watching foreign markets and crop conditions throughout the world, he is doing so now after the disastrous experience which pitched him headlong into the basement of farm produce prices the past two years.

The encouraging sign is, that agricultural products are showing an increase in export, but this does not mean that the farmer in Michigan should grow any crop which depends on the export market for its sale.

Michigan is rapidly developing as an industrial state, as Dr. Friday pointed out in a recent article which we reprinted completely in The Business Farmer. There is no longer any need for our farmers trying to compete as wheat growers with Argentine and the Ukraine.

There is a market, in Detroit and other industrial centers of Michigan which are growing at an unprecedented rate, for a great proportion of the agricultural products of the state. Already a milk shortage in the Detroit area is promised should we have a dry summer.

The hopeful thing about all of this is, that the farmers of no state in America, are in a better position for making money out of their farming operations in this year, 1923, than are the farmers of our own state!

REFORESTATION IN MICHIGAN

AS Senator James Couzens so ably states on page four of this issue, one of the most necessary guarantees for the future prosperity of the state of Michigan, can be secured through reforestation.

Fortunately, the Michigan Legislature, just before closing its hectic session, joined hands in unanimously passing the Meggison-Sargant Bill, which provides for a deferred tax on forest growth.

Under the terms of this bill the owner of any timber land, or lands chiefly valuable for the growth of timber, within this state, may apply to the Commissioner of Agriculture to have such property set apart for the growth of timber. If, after investigation his application is approved by the Commissioner of Agriculture the land shall thereafter be taxed at the rate of 5 cents per acre annually.

After a twenty-five year period, the timber would be subject to cutting, under general control of the Commissioner of Agriculture, who would guard against wasteful methods. At this time the owner of the timber would be assessed a tax equal to 25% of the stumpage value of the timber cut, to be paid into the state treasury. There is a provision in the bill which would prevent it from working a hardship on any local unit, as it provides that "The State Administrative Board may, in its discretion, advance to the township in which any forest preserve lands lie, a sum each year out of the general fund of the state, as will compensate them for the amount of taxes which would be collectible from any such forest preserve lands had they not been registered."

It is seldom that a legislative body can be made to look so far ahead as twenty-five years, and Michigan has taken a forward step which will place it among the leaders of conservation in the United States.

THE CASE BILL PASSED

THE Business Farmer is being given some credit at Lansing for its last minute appeal in favor of the Case Bill to prevent unlawful discrimination in the purchase of potatoes, and very wisely an amendment was made which makes it include grain and beans. That our readers made themselves known at Lansing is proven by the fact that this bill passed the House by a vote of 85 to 3.

As was pointed out in the last issue this bill was intended primarily to protect the cooperative elevators and farmers marketing organizations from the unfair competition practiced by the old line dealers. It has been the common practice by a few unscrupulous dealers to temporarily pay more than the market price in a town where a small or cooperative elevator was trying to get a start. These dealers were able to pay this higher price, for a short time, in a few localities, because they were paying the farmer much less than the market price in localities where they had no competition.

The only thing that will make this law effective is for the farmer to report cases which infringe on this law. There will be no police force or system of inspection to make this law effective other than the direct report of the officers of marketing organizations or their members. This is, in our opinion, one of the most practical and helpful laws passed for the benefit of the farming business in Michigan by the present legislature.

FAIR CARNIVALS ARE EXPENSIVE

OUT in Oklahoma the Agricultural College made a survey of that state which showed that 41 County fairs had carnivals as part of their attractions last fall. These carnivals furnish the complete midway, a whole street of attractions on the Michigan Sate Fair midway pany and travel as a unit. These 41 carnivals took $114,800 out of the counties in which the fairs were held.

There are no available figures showing the number of these amusements held in Michigan or the amount which they take out of the country, but we would venture the statement that more than this amount was collected by the attractions on the Michigan State Fair Midway alone last year.

We do not hope to see the midway abandoned on our state or county fair grounds for the very obvious reason that they contribute largely to the support of the fair, and it will take a daring fair management to eliminate this or any other profit producing attraction.

The responsibility rests with the management of the fairs. Every feature of every show or attraction on the midway should be investigated prior to and continually during the fair by a personal representative of the management.

Too often everything appears all right for the first day or two, but if the crowds are not coming as they should and the fair management has been appeased, the barker passes along the word, "the sky is the limit" and soon the sign hangs on the outside of the tent "standing room only!"

We want to see clean, entertaining, and instructive fairs in Michigan this fall, and we make "clean" our first requirement because we beleive that it is the feature in which most of uor fair have been lax.

THE SAVING IN STANDARDIZATION

THE automobile manufacturers of America have taught the industrial world a lesson which is so far-reaching in its importance to all users of machinery that it cannot easily be measured.

The automobile manufacturer proved that by standardizing every part down to the smallest bolt or screw the machine could be manufactured at half the cost where standardization was not practiced. The automobile today is an outstanding example of what standardization has done. Compare, if you please, what a thousand dollars would buy ten years ago and you will find that your dollar today, while it will purchase only a fraction of what it would in 1913 in clothing, shoes, or what-not, will buy much greater value in an automobile or truck.

The International Harvester Company have just made the announcement that for the past two or three years they have been diligently reducing every line of their machinery to the fewest number of pieces and a standardization in parts which makes it possible to secure repairs on the shortest notice.

If the manufacturers of farm machinery generally are following the lead of the Harvester Company and bolts, nuts, screws and the hundred and one small parts of farm machinery are being made standard and thus interchangeable it will be one of the best contributions ever made to the farming business,

THE SUGAR STRIKE

WOMEN'S organizations in each state have begun a buyer's strike on sugar; the same as was practiced during the war. Sugar has climbed over the ten cent mark and President Harding has approved the efforts of the agitators to thus reduce the consumption of sugar.

We have an idea that the strike will get nicely under way about the time the beet growers have a big crop to market. At least we predict that the manufacturers will report such a condition on or about the date set to determine the price paid for the farmer's beets!

PUBLISHER'S DESK

AMERICAN HORTICULTURE COMPANY QUITS

MANY Business Farmer readers have tried to collect claims against the American Horticulture Company, of Des Moines. We have had a large number of these claims on file, and we are sorry to announce that the company has gone into bankruptsy and we are placing these claims in the hands of F. E. Campbell, of Des Moines, who has been appointed receiver.

The American Horticulture Company opened up a spectacular business career a couple of years ago and advertised in an unusual manner with puzzle pictures. They received more business than they could handle, and then the depression period struck them. Before they could adjust their affairs, they were hopelessly in arrears and altho they struggled along, hoping to be able to take care of their creditors this spring by supplying stock to compensate their customers, they had to quit.

Fred Wright, the president of the American Horticulture Company, started another company, known as the Fred Wright Company, which tried to make enough money to pay off the indebtedness of the American Horticulture Company, but had little success.

It is understood that the liabilities are around $75,000 and the assets only a few thousand, so our hope of satisfying our readers claims is meager indeed. Luckily none of the individual claims are large.

STOCK TO PAY FOR ITSELF!

Dear Mr. Slocum: Do you know anything about —— -Coal Mining Company, at ———, Michigan? An agent of theirs came here with one of our friends who claimed he had been to the mine and that they were all right, and wanted us to sign a note for stock in the company. The agent claimed we would never have to pay a cent out as the company was paying 2% a month dividends, so my husband signed a note for 100 shares, $1,000, but I did not sign the note. We have 40 acres. We have a joint deed of the place. Now they claim the agent was a fraud, and that he should not have promised the dividends. We have witnesses that he said they were paying dividends, also that we would not have to pay any money out, that the dividends would pay the note and interest. That was the 19th of January. We have not received any shares. Is there any way of getting the notes back, as I think they are a fraud? Will you please investigate? Please let me know by private letter.—Mrs. P.

—I have written my reader that she had best place this claim in the hands of a local attorney immediately, because it will be money well invested to have legal protection from such sharks. What a pity it is that people will swallow such exaggerated statements as the foregoing.

Does it not stand to reason that if a company could pay 2% per month, or even 1% per month, that their entire stock issue would be taken up in a few minutes in any money mart?

Many times a legitimate manufacturing institution will have to secure additional capital for its business and because there is an element of speculation involved they must go to the general public to raise the funds. Many men have some savings which they can afford to speculate with, wisely or unwisely, but the minute a stock salesman starts making an extravagant claim, he ought to be shown the door, and mighty quickly, too.

"THAT MAN SILVERMAN!"

A couple of years ago the Business Farmer began receiving complaints regarding a man named Silverman on the Detroit market, who was advertising for produce, accepting it and then refusing to pay for it, through one subterfuge or another.

Securing no satisfaction we took it up with the Post Office Department, because most of the business had been done by mail, and although no criminal action was secured, apparently this man has disappeared from local haunts. This will answer one or two of our readers who have recently inquired about "that man Silverman."

WARREN McRAE'S FARM AGENCY

A reader advises that she has had a letter from the Chief of Police, Loganport, Indiana, in which he advises that he could find no office of the Warren McRae Agency, that McRae was making his home at a rooming house, and that he advised her not to send any money as "they were after the money and probably would not sell the farm." Have any of our readers heard from McRae lately, or has the Business Farmer made it too hot for him to do business in Michigan?

FROM ONE UNFORTUNATE

Having read in your excellent paper the way in which you have helped your readers, I am writing to see if you can help us. We read Warren McRae's ad and thinking we might dispose of our farm we did not wish to go to the city but the farm is too large for one man to work and it is next to impossible to get help, we wrote to him and he answered saying there were several farmers in his state who wished to look at Michigan farms so we sent him $10 as a listing fee when we received the communication which I will inclose and naturally we have heard no more from him. We realize now how foolish it was to trust some one we knew nothing about and am sorry your warning came too late for us. I think we have learned so next time we will write you for advice first. Am simply writing to ask if any thing can be done to get us back our ten dollars. Please do not publish our name, we don't wish our friends to know we were so "gullible."—S. B., Washtenaw County.

WORKERS' SERVICE BUREAU, JACKSONVILLE, FLA

Regarding this and other similar companies which advertise to pay a fixed sum for home addressing, and other home work, let me repeat my advice, to have nothing to do with a company which requires a down payment in order to secure some sort of employment.

RESULTS!

Received your card that you had taken up my claim and yesterday received my check, and a letter which I am enclosing. I am very thankful for your service. We have been readers of your wonderful farm paper for many years and think it a necessity in every farm home. I again thank you for your trouble, as I am positive I should not have received my money without your assistance. —Mrs. W. H., Harvard, Mich.

You surely get results when you go after things. I just got your card and by the same mail got check paying back my money they have kept three months. We surely appreciate what you are doing for your subscribers and surely expect to always take your most excellant paper. —Mrs. A. J. P., Jones, Mich.

I want to thank you for the prompt settlement made me. They did not hesitate to come to a settlement after receiving your letter. I am glad there is a way to wake them up. Thanking you again, I remain, Mrs. A. J. V., Gaylord, Mich.

I wish to thank you again for the quick settlement you secured for me from three different firms, during the past winter, which had owed me a great sum of money. Mrs. H. M. W., Fennville, Mich.

In regard to my camera, I received it after about three weeks delay. As they could not find my own they sent me a new one. Thank you very much for your services.—Mrs. L. F., Avoca, Mich.

I have today received the enclosed letter from Dr. containing check for $4.65. Thank you very much for your trouble.—J. W. H., Chase, Mich.

KEEP THE BUSINESS FARMER COMING
SEE PAGE 28

What the Neighbors Say

MUCH PESSIMISM—SOME TRUTH

MAKING it easier to slide deeper in debt is not goin to cure a chronic disease gnawing at the very vitals of our agriculture, the cradle of a free people and the very first and last stand for hungry bellies. No loan or increased acreage yield will right the situation. What is needed is a cure not a deadener.

With agriculture the real giant in a business sense, and no voice in setting the price upon its products, but a never failing cost plus price upon his every purchase; bled white by marketing tolls is a real complicated disease that will not yield to cocaine treatment from Washington nor even Mr. Coue's suggestions.

With no voice in regulating the price of their products; forced willnilly to supply their wants in a home market protected by the highest tariff barriers in the world—thanks to the farm block support for which the farm world received a string of glass beads. The farmers are skinned from heel to head by the very system they helped to create with their vote.

The selling price of our products, in most cases produced by robbing the soil, contending with frosts, drowths, cyclones, floods and bugs is governed in the main by the selling price in the world's competing market under normal conditions, while our protected industries and transportation interests depend mainly upon the home market for its fat picking.

The only hope for brief periods of prosperity for our farm world is in foreign crop failures.

As our farm world must rely upon misfortune abroad for its occasional silver lining, one need not wonder why the farm game is losing its lure.

How a tree is to remain vigorous and bear fruit annually while continually starving its roots is just a little beyond my think tank.

Some how or another, the word "square deal" should carry a real meaning—and a jail sentence even in legislative halls when using it for bunk purposes.

Being half Irish, I am naturally an optimist—but not on the land question, unless I had reason to believe there was a little oil or mineral below.

I can not help but believe, unless some Moses appears upon the scene real soon, and this does not mean a plaster paris farmer, the peasant stage in America is just around the corner, and for this decaying situation, no one class of voters is more responsible than the cock-sure farmer, buncoed by the magic word "protection" in the childish belief that all property is distributed down from the top layers of society.

I haven't the least doubt but what this same view point was held sacred by old King Tut's well disciplined field slaves.—John G. Krauth, Presque Isle County.

WOW!!

THE Editor The Business Farmer—Yes, the gasoline tax went down in defeat, tho not inglorious. It was Groesbeck and Detroit who made inglorious asses of themselves. Two-thirds of the population of Michigan stood for the gas tax but Groesbeck and Detroit bullied and bossed till it was defeated.

If the weight tax becomes a law, our car stays in the garage till Michigan has a decent form of government; or we can move. We prefer to move.

Michigan boasts of progression, intelligence and good government. I wish we might see the effect of these fine qualities somewhere.—G. E. Wise, Hart, Mich.

A FOOL TARIFF TO FOOL FARMERS

NURSERYMAN Harry S. Cooper, of Wisconsin, says in the last issue of M. B. F. that practically all we need is the scum of Europe to work on our farms and we will all sit in the shade as farmers and just pick our teeth and count our money.

Now, let's look at the actual results of the present fool tariff, for and against the farmer. Hardly ten days ago the experts of the Farm Bureau Investigation Committee gave us in the Country Gentleman the exact facts.

On account of the tariff it costs the farmers of America a round million dollars a day for excess cost of manufactured goods, over a year ago. That means the farmers are "skinned" over two hundred million dollars a year on this "hos-trade."

Now I hear some protection tariff farmer say, "Oh! that supports the government," when the fact is any high school boy, even with Republican parents, knows a prohibitive tariff, (and our present one is the highest and most prohibitive every passed) never supports our government because nearly nothing moves our way under a prohibitive tariff, which gives the manufacturer's Union, (ten times more expensive to farmers than any labor union) all the monopoly they can wallow in and "wallow" is the only fit word, for if there is a bigger hog on earth than our protected manufacturer under this Harding Administration, then as the Judge says, "May the good Lord have mercy on your soul."

Of course Harding was elected largely by women who though keeping out of the front door of the League of Nations was our only world-salvation, and now he's at the back door; but Hardings campaign-millions came from the protected Manufacturers' Union of the U. S. A. and today they get those millions back every week from Friend Farmer, in exchange for political "soft-soap." How will you have your "soap," boys?—C. H. Merrifield, Van Burren County.

PRESENT CONDITIONS AND A POSSIBLE (?) REMEDY

I KNEW there was something that I missed when I got home. It comes to me now, when I received your card that it was the M. B. F. Sure thing, I must have it. Send it along and send me the bill if I'm in arrears, it will be paid.

It is a long time since I heard from you or you from me, so I'll send you a few thoughts on the signs and conditions of the times and the future outlook, for our people and the country. We all know that we are in a peculiar condition—financially, politically, and morally. We can not all agree upon the different questions that arise from time to time, we all know, we are in a precarious condition and it doesn't appear to be getting better fast, at least not for the farmers and the producters. There seem to be a lot of would be helpers—but when you come to analize their mode we discover, it is only to get us in deeper. They promise legislation to help the farmers. You get that from all of the office-seekers, and the papers from all over the country. But when you come to find it out the farmers must pay the bill, in the end, with interest.

The question is: What or where is the trouble?

In the first place interest on money is too high, and our circulating medium is not based on actual products of labor and necessities of life, which is the only actual basic wealth of the country.

Lincoln said "this nation can not exist one half slaves." We are now 90 per cent or better slaves under the bonding system, which not only enslaves us, but the coming generation, for they will have to shoulder and to pay our enormous bonded indebtedness. Now this does not only apply to the farmers, it applies to all our citizens, excepting a few speculators, financiers and grafters.

Is it possible that the people of these United States, the decendants of those men that liberated this land from a foreign yoke, and wrote that wonderful instrument of Independance and afterwards, defended that act by driving from our shores the oppressors who sought to enslave them. Are we now willing to let a group of unscrupulous grafters and profiteers enslave us and our children? Is it possible that we have so degenerated that no one among us dare to stand up for the right of the people? Are there no Washingtons or Lincolns or any of that liberty-loving spirit left in the land.

Is it possible we are all willing to stand by and see the people robbed of the fruits of their labors and products of this wonderful country by a few speculators and financiers, the majority of whom, do not even spend their time or money here at home? As a rule they travel abroad, live among royalty in foreign lands. They spend our money with lavish hand in Paris, Rome, London and Monte Carlo. Sure, they have their agents and lobyists here. They keep well posted and their business interests are well looked after and protected. We have been looking back at the monarchial form of government and congratulating ourselves on the fact that we are living under a government by the people and for the people, when in reality we are at the mercy of a more cruel, merciless and unscrupulous bunch of profiteers than any monarch that ever did exist. They employ all manner of neferious schemes and ways, bribery and even murder is not too low for them to carry out their schemes. The news-

Uncle Rube Spinach Says:

I'M AGIN SIR WM. ORPEN'S JUDGEMENT

WHEN we speak of woman's beauty there's quite a considerable to think about. Beauty—real beauty is a thing 'at natur' gives to a woman jest the same as she gives to a flower or a bird or anything 'at's as natur' makes it.

Sir William Orpen, great portrait painter of Paris, sez there's no beautiful women. "In my twenty-five years of painting," he sez, "I've never seen a perfect model nor a really pretty woman."

"Ten or fifteen years ago artists had but little trouble to select paintable arms an' legs, but now they have to search for weeks," he sez.

Well now, I wonder if arms an' legs is all there is pretty 'bout woman? Why I can show ol' Bill Orpen more beautiful women 'an he ever dreamed of—not only here in my own little town but in other places in our good ol' state. Beauty does not consist of arms an' legs entirely—it's a thing that can exist without 'em.

I am aware 'at most all the beauty contests, as shown in the papers durin' the past two or three years, has consisted of arms an' legs—that's 'bout all some young women care to have pictured these days—but friends the real beauty of women is more 'an that.

When you see the lovelight in their eyes, the motherhood in their faces—the real womanliness 'at God has given, pictured in every line of their face and features, then you've got real beauty! An' I can see it every time I go on the street. Maybe some ha[illegible] ir silvered with age, some just [illegible] outhful glow, nevertheless, if [illegible] ovelight, the motherhood, shine[illegible] out they are beautiful. Maybe they have arms, maybe legs, I never stop to think of it—it's that something that age can't take off nor paint put on 'at makes women altogether lovely. An' I know so many 'at are jest that way—wonderful women an' beautiful 'cause they live as God intended 'em to live; living for the purpose they were created for an' doin' the best they can at it.

Now maybe Bill Orpen knows a lot 'bout beauty but in my foolish judgement he don't know much 'bout the beauty of women if he judges 'em only by their arms an' legs. An' yet I'm wonderin' if some of our young women ain't kinder got some of his notions? The way they've been displayin' legs an' arms for two or three years, I'm most decided to think 'at's 'bout all they've got. An' yet I do see many most beautiful an' lovely girls, girls 'at dress nicely an' becomin'ly an' show the real beauty that lies within. They know they have somethin' besides arms an' legs to recommend 'em an' they really are beautiful in every sense of the word.

We don't care what William Orpen of Paris sez, do we women friends? He don't know everything. An' let me tell you something: the real beautiful women of the next few years will be the ones 'at keep 'emselves as natur' made 'em.—Cordially yours, UNCLE RUBE.

papers which as a rule, they either own or control and by that they practically control our elections.

Now let us look, I'll give you a few of my thoughts along remedial lines in it there may be some repetitions, but some of it surely needs repeating, so that our people may get posted on the actual existing conditions.

First, let us consider a few facts relating to our commercial and financial business—of the nation. During my 50 years of business experience I found that interest on money was the slickest and easiest way of getting it. All that is necessary is to get good security and then you can sit right on you haunches and make a fine living and plenty of money, without producing a single thing, except some trouble for the other fellow—for if you are a good money lender and collector your game is to get all you can, and if you get the right fellows in the proper shape it is your business to profit by their misfortunes. Now that doesn't only apply to the individual money lender, that is the game of all our big financial concerns. Our financial resources are controled by so very few, that it is entirely within their power to withhold and depress credit. In other words, to make money dear to the people that must have it to do their business with.

This brings me to a little investigation as to the total indebtedness of this nation.

Our debt on July 1st, 1921, was $23,427,772,447, or a per capita of $216.75. Now our interest bearing debt on that date was $23,738,900,084. The annual interest charges are $1,017,500,000. Next comes the different states, bonds, and indebtedness which amounts to $1,167,204,809. Now, these are our state and national indebtedness and does not include municipalities, such as counties, townships, highways, schools, cities, corporation bonds, etc. Next take into consideration the real estate mortgages, private and individual obligations, which will amount to many times the National and state indebtedness above referred to. Naturally, we might commence to wonder where the money is going to come from to pay even the interest, let alone the principle. It must all come out of the producer, in some shape. Now, as near as I have been able to find out by investigations, we have in actual money $1.78 for each $1,000 of our actual debt. Now, look at that, surely the thing is commencing to look like a crazy-quilt. If we were forclosed and sold out, atour assessed valuation and proceeds pro rated among the creditors, that is to say, if we took all the money in the land, our creditors could only get $1.78 on every $1,000 that we owe. (That is on a single standard measuring our wealth by gold.) Now, with such a small amount of actual money to do such and enormous amount of business, it has become an easy matter for a comparatively few to control the finances of this nation, and practically speaking, the entire civilized world has been enslaved through that system. We have become in bondage to such an extent that we couldn't pay the interest with actual cash (gold) for three months, and where has this tremendous debt fallen? What class of our people must pay? The answer, of course, is the producers, and actually we are not paying it in money, it is on paper. It is not a matter of good headwork and fine bookkeeping by the money lenders.

Now you can percieve, the producers have got some tall hustling to do. I presume that everybody that has studied upon this subject have some ideas of a remedy, I know I have and of course it is a radical proposition, but sooner or later some different system will have to be adopted. We are not going to get out of this mire by getting deeper in debt. This hollering about giving the farmers more credit will only bury him deeper. Now, I'll throw out one or two suggestions, which in my humble way of thinking might let us down a little easier and not break all the bones in the carcass, by a sudden drop like Germany got, which before that time a few, years ago was the richest and most prosperous country. I had the pleasure, a few years before that happy thought struck them, that they were the mightest power on earth, to travel through that wonderful country and I thought something like Roosevelt, but, of course, I didn't get the chance to tell his nibs over there, that I thought he could lick the world, and I guess Roosevelt did and he believed him, and, of course, "Down went McGinty' but going back to my remedy for our ills—First, get the law upon our statute books, a law strong enough to make it a criminal offence equal to the crime of highway robbery to hereafter charge over 3% per annum on any kind of indebtedness. Have that law made broad enough so that by no hook or crook anyone could hereafter make contracts in any way conflicting therewith.

Now, that surely would be royalty enough for them lord's who have not produced even a fraction of their own wealth. Now, you may say, you wouldn't get money enough to do business with at that rate. To that I will say, establish warehouses and elevators throughout the lenght and breadth of this great country, wherein to store our staple grains and produce. Issue warehouse certificates not only for the produce but for the warehouse if necessary, and make them a legal tender in the realm and then let the speculators play with the gold on the outside if they want to. Now this is not a new scheme at all, as a matter of fact, it is as old as the Bible. In the time of King Pharoah and Joseph, it was tried out, and afterwards during the time of King Frederick the 7th of Denmark, along about the year 1840. It was carried out in a very successful manner along the very lines alone stated. It was the beginning of the prosperity of that little country. Now the actual basic wealth of a nation is its force of labor, its raw material and its ability to produce the necessities of life.

Now, why should not our wealth be based upon those things? But as it looks to me, our house is built upon the sand and if we do not look after it and repair the foundation it might be washed away.

Now, you think that I, myself, am in some financial difficulty, but that is not the case at all. I have benefited to some extent financially by the existing conditions, but I did not really understand what the final results would be and from my point of view it does not look bright. Think this over and improve upon it and as Crabtree says, "Let us help one another." Success to your valuable paper.—Chas. Kerr.

KILL GAME AND POULTRY-KILLING BIRDS AND ANIMALS

THIS is the season of the year when a few days spent in shooting game and poultry-killing birds and animals will repay the effort later on. If farmers, trappers and sportsmen would concentrate on a few bad species, the chief natural enemies of useful and game birds, and poultry, would receive such a set-back that the annual saving throughout the country would run into millions of dollars.

Among predatory birds, the crow occupies the worst place. The Board of Game Commissioners of Pennsylvania say that he "destroys individually more birds of all kinds, more birds' eggs and young poultry than any other bird that ever flapped a wing". The great horned owl is another bird of prey, so voracious and destructive to useful wild life that he should be killed. This species destroys annually large numbers of partridges, pheasants, fur-bearing animals, rabbits, other game and poultry. It is especially an enemy of the quail.

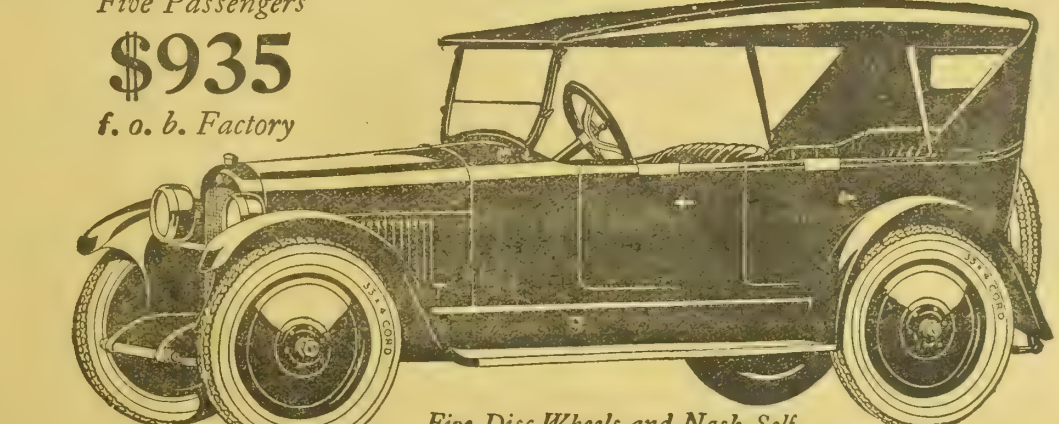
Noxious hawks are another species which take a heavy toll from the farms each year. Two of these, Cooper's hawk and the sharp-shinned hawk, which might be called a miniature of Cooper's hawk, are ferocious predatory birds of prey, ranging nearly everywhere throughout the country and the damage they do is estimated, in the aggregate, to exceed that done by nearly all other birds of prey. Remains of wild birds and poultry were found in nearly every stomach of Cooper's hawk, examined by the Biological Survey. When the stomachs of them contained birds, ranging from quail, morning doves and flickers—which are as large as the sharp-skinned hawk itself—down to birds as small as warblers and chickadees.

During the next few months, game birds and other beneficial wild birds will be hatching, and great numbers of them can be saved if their natural enemies are checked now.

Nash Leads the World in Motor Car Value

NASH

Four Touring Model
Five Passengers
$935
f. o. b. Factory



Five Disc Wheels and Nash Self-Mounting Carrier, $25 additional

The Nash Four five-passenger touring type is a model pre-eminently fitted for the hard work a farmer requires of his motor car. Every inch of it and every unit is fashioned ruggedly to withstand the wear and tear of continuous driving under load over rough roads. Advanced achievements in automobile engineering have increased the vigorous volume of power and at the same time heightened its flexibility, smoothness and economy.

The Children's Hour

THE STORY OF OUR NATIONAL HYMN

It was a gloomy day in February, 1832, that Dr. Samuel F. Smith, turning over the pages of a German book of songs, came across the English air "God Save the King." He liked the tune.

Half an hour later he produced the words of the national hymn of the United States "America," or, as some called it, "My County 'Tis of Thee," which he fitted to the melody of "God Save the King."

Dr. Smith was born in Boston, 1808, and was a theological student. It was in his home town, in the old Park Street Church, that his composition was sung in public for the first time. That was on the Fourth of July, 1832.

The words of the great song were written on a scrap of paper that the composer picked up from the table near which he was sitting when he first thought to write them. They are substantially the same today as when he first jotted them down.

Never was "America" recognized generally as a song that greatly inspired patriotism until the opening of the Civil war. Since that time it has been accepted by the world as one of the greatest of national anthems.

Dr. Smith died in 1895 at the age of 87 years.

ANSWER TO PUZZLE IN LAST ISSUE

On man was a broker, another a baker, the third an engineer, and the fourth a grocer.

OUR GIRLS AND BOYS

Dear Uncle Ned—Maybe you don't think I was surprised last Friday when I came home from school and found the letter from you, saying I had won the prize. I could hardly believe it for I had always thought it was hard to win a prize. And, say Uncle, you must have known that I am taking lessons in dressmaking. I like the scissors fine and I am sure I will make good use of them. I will close thanking you for the scissors. So, good-bye, from your neice, Katie Prowant, Durand, Mich.

—I am pleased to know that the prize was appropriate. Must be some little bird told me what you wanted, eh?

Dear Uncle Ned—I am writing this letter to let you know I would like to join your merry circle, "The Children's Hour." I just adore reading the M. B. F. magazine after my work is done. I am very interested in the continued story, "The Hunted Woman," and can hardly wait for the next issue of the magazine to come. I live 2 miles west from the village of Temperance. Our house stands on a hill. Near the house is an old apple orchard. Across the road is a forest. We gather pussy willows there. I live with my mother and older sister, Mary. I also have two younger sisters. One is called Clara and the other we nicknamed "Snowball." There are five of us children but one is married and lives in Toledo, Ohio. We have two horses, one is called Patty and the other Jim. We also have 3 cows and a heifer. The cows we named Bessie, Jessie and Katie. The heifer's name is Peggy Jane. My mother and my older sister and I do the farm work during the winter and summer while my dad works in town. It is real hard to handle a team of horses and do the work a man is supposed to do, but it is better to be industrious and know how to work than to be lazy. Don't you think so Uncle Ned? I will describe myself and end this letter to you for it is getting too long. I am 16 years old, I was born October 17, 1906, am 5 ft. 3 in. tall. Have dark brown hair, and grayish blue eyes. My hair is bobbed.—Stella Voilet Nowak, R. 2, Box 106, Temperance, Mich.

—Yes it must be hard for a woman to handle horses and do the work a man is supposed to do, but as you say, it is best to be industrious.

Dear Uncle Ned and Cousins—May I enjoy your merry circle? I am five feet three inches tall, and seventeen years old. I am very much interested in the letters the children write and I would love to hear from some of them. I would surely answer their letters.

Perhaps you would like a description of myself. I have auburn "bobbed" hair, and blue eyes. We have a radio. I think this invention a wonderful thing. Don't you? Ours has a loud speaker. Well I must close now, hoping I hear from some of you very soon. With love to Uncle Ned and Cousins, Ruth Bower, North Branch, Michigan.

—Yes a radio is wonderful. In one evening you can hear talking or music from east, west, north and south, places hundreds of miles apart, while you sit in your own home. I hope some day that every farmer in Michigan can afford one.

Dear Uncle Ned—I wrote about 2 weeks ago and I have received 12 letters giving the answer to that riddle, but one was wrong and her name is Wilma McTaggart. One girl called up on the telephone, her name was Dorothy Casey. If I answered them all I would have to write 12, but I hope you will print this because I cannot answer all of the letters I received and I am going to answer them all in one and I want you to publish, Uncle Ned. The answer to that riddle I asked is "a candle." I will write a story about a trip to Detroit.

When we left Elkton, it was a nice sunshiny day, but when we got half way between Elkton and Detroit it started to rain real hard, and I saw more than one barn and house that was on fire on account of being struck by lightning. When we were going to get off the street car we told the conductor where to leave us off and I guess he misunderstood us because after he left us off the street car we had to walk 5 blocks up to my grandma's house. The third day I was their we went over to Belle Isle on a ferry boat and saw many animals such as bear, alligator, ostrich, monkey, and many others. We came back in a bus and when I got home mamma told me to go down to the store and get a bar of soap and some bananas and she gave me 75c. So I took the money and went to a store where some Italians clerked and they could not understand what I meant when I said, "I want a bar of soap and the rest of my money in bananas," So they gave me the soap and 50c worth of bananas and gave me 50c back. When I got home that time, mamma told me to go back and get the rest of my bananas, so I went and got them and when I got home I found out I had $1 worth of bananas and the soap for 75c. When we started to Detroit it was awful warm weather, but when we got back to Elkton it was cold weather and my uncle was there to meet us with coats for us all because we did not take any and we went to his place for supper and he drove us home in the car after supper. I made a mistake in the letters which I wrote to some of the girls by saying we had to walk one block when we had to walk five. Say, Uncle Ned, will you write your address at the top of the Children's Hour, because some of the girls asked me it and I am writing this letter to the M. B. F. I have 4 sisters and no brothers. Their names are: Gladys, Ilene, Hattie and Mary.—Hazel Baker, Elkton, Mich.

—I am glad to print your letter, not just so the cousins can read the answer to your riddle but because it is interesting. My name and address is just Uncle Ned, Michigan Business Farmer, Mt. Clemens, Mich., and a letter with that on will come to my immediate attention. Tell your friends that I shall be pleased to hear from them, will you?

Dear Uncle Ned—This is my first time writing to the Children's Hour. My father takes the M. B. F. and likes it very much. I like to read the letters and so I thought I would write, too. I live on a small farm just a short distance from town and I go to town school and am in the sixth grade. Our room had 100 per cent joined the Audubon Club and expect to study a book called "Bird Study." We also have studied the story entitled "The Legend of Sleepy Hollow." Thursday afternoon our room went to Alma to the theatre and saw the story in pictures. It was very interesting. Here are some riddles: Why does a man wear a large watch and a woman a small one? How does water get into a water melon? Why is a woman and the sole of a shoe alike? What is the largest word in the dictionary? If any of the cousins guess these riddles please send the answer to the Children's Hour. As my letter is getting long I will close hoping to hear from some of the nieces and nephews, Your Niece, Ferne Irvin, St. Louis, Michigan, Route 4, Box 3.

—I know you will enjoy "Bird Study" and I'll bet you found "The Legion of Sleepy Hollow" very interesting. I know I did. I have never seen the moving picture of it but as you say it is interesting. I will go the first opportunity I have.

Dear Uncle Ned—I have been a silent reader of the Children's Hour for sometime and I thought you would like to hear from another of your nieces. Would you? I will describe myself. I am a girl 12 years old and am in the 6th grade at school. I have brown eyes, dark hair and have freckles. I live an a 98 acre farm. I have 4 brothers and 2 sisters. I have 1 mile and a half to go to school. I think the best department in the Business Farmer is the Farm Home Department and the best department for a man is "Poultry for Profit." Well I will have to close now and leave room for other cousins to write. I would like to get a letter from some of my cousins. I will answer all letters I receive. My birthday is October 18. Have I a twin? I will say good-bye now, Uncle Ned and cousins.—Thelma Crosby, Edenville, Mich. Box 77.

—Glad to hear from you, Thelma. Come again.

Dear Uncle Ned: I have never written to you before, but have read the Children's Hour and enjoy it very much. My father takes the Business Farmer and likes it very much. I am a girl 13 years old, am in the sixth grade at school. I live about one-half mile from school. I live on an 80-acre farm. I have one sister, her name is Mary. She is 22 years old. I also have one brother. His name is Walter and he is 25 years old. We have 2 mules, 1 horse, 4 cows, 2 calves and 65 chickens. For pets I have 2 cats. Their names are Tabby and Tom. My letter is getting a little long so will close with a riddle. Would like to have some of the cousins write to me. Use me well and I am everybody? Scratch my back and I am nobody? Answer: A looking glass. Your niece.—Ernestine Frick, Coleman, Mich., R. R. 4, Box 46.

Dear Uncle Ned:—I noticed in the Children's Hour that you are going to give prizes to the one that found the most interesting article in this issue. I thought mine would be Market Flashes, becauses the farmers all want to see the price of their crops and see if they are high or low. My Address is—Miss Gladys Hanson, R. F. D. No. 1, LeRoy, Mich

AIDS TO GOOD DRESSING

RIBBONS were never used more plentifully by the dressmakers than this season. Frocks and jaquettes are made entirely of wide ribbon fagotted together. Some of the new georgette frocks show countless bands of ribbon by way of embellishment and a very wide, substantial ribbon is often chosen to form the bustle effect on afternoon or evening frock.

4349

4342. Fashions Latest Blouse Style—Charmingly developed in figured silk with bindings of crepe satin in a contrasting color, this style shows new and attractive features. It is also a good model for taffeta, printed georgtte or voile. The Pattern is cut in 7 Sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 2 yards of 36 inch material.

4340. A Popular Model—This is a season of short coats. The style here portrayed will look well with a plaited skirt of plain cloth, or it may be part of a two or three piece suit. Taffeta, figured silk, pongee or linen would be attractive for its development. The Pattern is cut in 7 Sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 2 ½ yards of 40 inch material. For collar and vest of contrasting material ½ yard is required.

4345. A Popular Suit Syle—For Little-Boys—This model will be fine for linen, galatea, poplin and jersey. The sleeve may be in wrist or elbow length. The trousers are made with side closing. The Pattern is cut in 5 Sizes: 2, 3, 4, 5 and 6 years. A 4 year size requires 2 ⅝ yards of 36 inch material.

4346. A Neat Little Frock For The Little Miss—For this dainty model one may use any of the wash fabrics now in vogue. The sleeve may be finished in wrist—or elbow length. As here illustrated the design was developed in pongee with fancy wash braid in colors for decoration. The Pattern is cut in 4 Sizes: 1, 2, 4 and 5 years. A 4 year size requires 2 ⅛ yards of 27 inch material.

4349. A Very Dainty Dress For "Mother's Girl"—Embroidered voile and organdy were chosen for this pleasing model. It is also nice in silk, gingham and crepe. Dotted Swiss and organdy could also be combined for this style. The bertha trimming may be omitted. The closing may be at the centre back, as illustrated or on the shoulders. The Pattern is cut in 4 Sizes: 6, 8, 10 and 12 years. A 10 year size will require 3 yards of one material 40 inches wide. If made as illustrated, ⅞ yard of contrasting material, and 2 ⅛ yards figured material is required.

4354. A Pretty Frock For The Growing Girl—Printed crepe and crepe de chine are here combined. One could use printed and plain voile in combination or tissue gingham and linen. The trimming panels may be omitted. The dress slips over the head. The Pattern is cut in 3 Sizes: 12, 14 and 16 years. A 14 year size requires 4 ¼ yards of one material 32 inches wide. To trim with contrasting matrial as illustrated requires 1 yard.

4338. A Stylish Frock—Here is a smart style in over blouse effect. The girdle section is part of the shaped front, which has small inserted pockets at the tab extensions. Tissue gingham in green and white, with bindings of green organdy will be pleasing for this model. The Pattern is cut in 7 Sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 4 ⅞ yards of 32 inch material. The width of skirt at the foot is about 2 ¼ yards.

4331. A Pretty Gown—Here is a very pleasing model, with a new sleeve effect. It is a style that is attractive for combinations of material. Lace and silk, linen and gingham combined would be pleasing. The Pattern is cut in 8 Sizes: 34, 36, 38, 40, 42, 44, 46 and 48 inches bust measure. A 38 inch size will require 5 yards of 36 inch material. To make panel and sleeve draper of contrasting material, will require 1 ½ yard 36 inches wide or, 2 ⅝ yards 18 inches wide. The width of the skirt at the foot is 2 ¼ yards.

FARM MECHANICS

PROPER SIZE PULLEY

SIMPLE rule given for figuring diameter and speed needed for efficient operation.

The use of the proper-sized pulleys has a lot to do with the efficient operation of belt-driven machinery. How to select the proper sizes is not as difficult as some people think.

In every case one knows, or can find out, two facts about one of the pulleys—its diameter and its speed. One also knows at least one fact about the other pulley—either how fast it should run or how large it actually is.

An example shows how to figure the unknown quantity better than explanation.

Take an engine running at 600 revolutions a minute. The engine pulley is twelve inches in diameter. You desire to run a feed grinder at 900 revolutions a minute. What size pulley should you get? You know the engine pulley's speed is 600 revolutions and its diameter is 12 inches. You know but one thing about the grinder pulley, its speed, which is 900. How can you find the diameter?

Multiply together the two things that you know about one pulley and divide by what you know about the other pulley.

In the above example, 600 multiplied by 12 makes 7,200. Dividing this by 900 gives 8. Therefore, an eight-inch pulley is needed on the feed grinder.

The result will not always come out even, and as pulleys are sold only in certain sizes it is necessary to select the next larger or smaller pulley. When computing the diameter of a driven pulley, select the next size smaller. When computing the diameter of a driver pulley, select the next size larger.—Farm, Stock and Home.

CHANGING TIMES

By JOHN T. BARTLETT

BETTER FARM WANT ADS

I HAVE noticed this: When individual farmers advertise nowadays, their advertising is usually much better than average farm advertising of only a few years back. Take daily and weekly newspaper want ads as an illustration.

The want ads are convenient and efficient business aids, as farmers have realized for years. But there are good ways and poor ways of writing want ads. Only a few years ago, it was a most uncommon thing to find a farm want ad written with real advertising skill. The formula was about like this: Write, "For Sale," and then what you offer, in the briefest possible words. "For Sale—Cow," "For Sale—Alfalfa hay," and similar want ads were common.

Contrast these with recent want ads noted by the writer.

A farmer whose want ad on apples informs the reader that he has eight seasonable varieties, at stated prices. Moreover, that "every buyer this week receives a free pumpkin."

A farmer's "cow for sale" want ad which states the breed, age, weight, amount of milk given, when to freshen, and offers to sell on trial.

A farmer's want ad offering setting eggs for sale which informs us this farmer sold 300 settings to "satisfied customers" the year before; that his flock last year earned $2.50 per head; that 90 per cent fertility is guaranteed.

These are good want ads. They say something which makes the reader, if he is remotely in the market, feel like investigating further. They emphasize that though a want ad seems a little thing, plenty of thought and pains can be put into it, and ample reward obtained. Thus a fruit district selling fruit on the trees to city people, uses several keen want ad selling plans. One orchardist advertises he will call for customers in his flivver, and take them to his farm and at the end of the day, home. Another man features the size of his trees—how easily picked. Still another arranges with a downtown store to exhibit his fruit, and urges readers to view this exhibit—then come out and pick. All these advertisers state price in their want ads—something which always should be done if the price is reasonable, and conducive to sales.

POULTRY COLOR SCHEMES

ALWAYS, it seems there is opportunity for the individual, adapting methods to his special conditions, to gain desirable results by doing something in a novel, different way. Poultry color schemes observable at Tulare, a Western district—the single large flock, ranging through orchards, showing buff and white, or white, black and brown hens—are an interesting illustration of this. There is a reason for these flocks of these different varieties, and it is intimately associated with profits.

Big poultry flocks usually are of one color. There is a reason—it pays the poultryman best to handle one breed alone. At Tulare a single flock will contain two or three varieties. Buff and white may be Buff Leghorns and White Leghorns. White, black and brown will be White Leghorns, Anconas, and Brown Leghorns.

Tulare adopts the color schemes as part of a plan for increasing the total agricultural production of a single man. One farmer is told about who handles 70 acres of alfalfa, milks four cows, and attends to 1,000 hens. He is able to do this because of labor-saving methods with the poultry. The chickens roam over many acres. Mammoth hoppers, placed here and there, are filled only once in several days. The chicks are bought of a large hatchery, saving the farmer a great deal of labor.

One year one color will be bought, the next year another color. The early years of a hen's life are the most productive, so Tulare ships hens to market at two years or three years. If at the end of two years, then two colors are kept; if at three years, then three colors. The color identification of age is a big time-saver over the leg-band method—that is why different colors are kept. When the time comes to cull, there is no laborous examination of leg-bands. One glance at the feathers tells.

It is a mistake to believe the period of method origination is past in American agriculture. New ways of doing things are establishing themselves right along, and someone always profits.

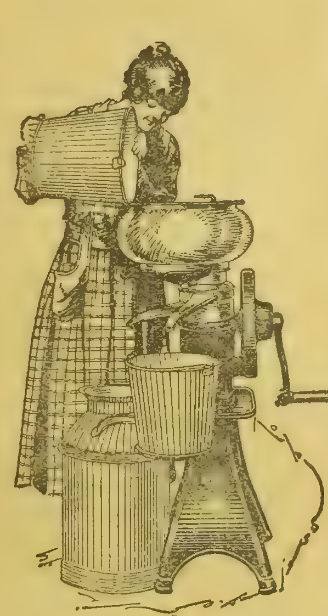
HOW SHALL FERTILIZER BE APPLIED FOR POTATOES?

(Continued from Page 4)

ways of applying fertilizer for potatoes. The first of these is by means of a fertilizer attachment on the planter. These attachments have been carefully designed by most of the manufacturers, and are the result of considerable study. Properly adjusted, they mix the fertilizer with the soil so that it does not come into contact with the seed pieces. The fertilizer attachment is generally placed ahead of the seed hopper in such a manner as to apply the fertilizer before the seed is planted. Generally adjustment can be made to either put the fertilizer below the seed with soil between, or to plant the seed in the fertilizer-mixed soil. The limited experiments that have been conducted on the exact method of placing fertilizer favor distributing it below the seed. The second method of applying fertilizer in the row is by means of a separate fertilizer distributor before the crop is planted. This method seems to be growing in favor, particularly where large quantities of fertilizer are used. A two-row distributor opens the furrows for two rows, applies the fertilizer in about any method desired in the furrow, and mixes the soil and fertilizer together. The rear coverts leave a mark to follow in planting. From the standpoint of thorough distribution this method is excellent but it has the disadvantage of involving a separate operation.

There is a common impression that fertilizer in the row causes bunching of the roots. Careful investigations carried on by both the Wisconsin and Michigan Experiment Stations on corn indicate that hill application of fertilizer on corn does not cause the bunching of the roots. While the results of these investigations cannot be applied definitely to potatoes, there is ground to believe that the objection to row fertilization is not so important as it once seemed.

McCormick-Deering Primrose
BALL-BEARING
Cream Separators



PRIMROSE Cream Separators have been making a good name for themselves in all the dairying sections of the country. Their good work is usually taken for granted, but if you will turn in wherever you see the sign "Primrose Cream Separator Used on This Farm," and make inquiries, you will find liberal praise for the Primrose. Everywhere is proof of close skimming, long wear, and easy operation. Read this evidence:

Mr. C. W. Coon, Colesburg, Ia., Feb. 26, 1923.
McCormick-Deering Dealer, Colesburg, Ia.

Dear Sir:—You will no doubt be interested in knowing about the Primrose Cream Separator which you sold me 5 years ago and is today giving such splendid satisfaction.

I just returned from the Colesburg creamery and was told that my cream test was the highest in a year's average over the 300 other patrons bringing their cream to this station. The cream test averaged 44% during the year 1922 which is 3% higher than the next highest average test.

At the same time our skimmilk test was less than 1-100 of 1%, so we were sure that the Primrose was getting all the cream.

The repair expense on this Primrose separator has been only $1.50. Anybody looking for a close-skimming, economical cream separator does well to buy a Primrose—for it's a machine that can't be beat. Yours very truly, [Signed] J. W. Platt & Son.

At Custer, Michigan recently the dealer held a Primrose Service Day and had a factory expert on hand to give whatever help might be needed. Of 200 Primroses sold locally in the past ten years, only 11 were brought in needing repairs or adjustment. Of this number the biggest repair bill was 89cents. Such a record speaks for itself.

THAT is the sort of work the Primrose has been doing for farmers. See the note at left also. Now, with ball bearings and other improvements, the McCormick-Deering Primrose Cream Separator is all the more qualified to save cream and money and time for new owners. Made in 5 sizes: hand and power operated. The McCormick-Deering dealer will show you this ball-bearing machine.

MOTHER'S DAY

IN our last issue I mentioned Mother's Day and find it falls on Sunday, May 13th. Let us not forget Mother this year. Maybe she would just love a nice rest day and with a little effort on our part we could give her that happiness that comes with thoughtfulness I think it is wonderful to have this special Day set aside for her. It sort of checks up on every other day and if we have forgotten, which we should not, we are telling her by our actions how dear Mother is to us. Try and make some special dish or little remembrance that will tell the story of our love for her. Do not forget her if she is not with us any more. A flower or a prayer in remembrance of one we dearly love. It is the custom to wear a white flower for the mothers who have passed on and a colored flower for the living.

Your Friend,
Mrs Annie Taylor

Address letters: Mrs. Annie Taylor, care The Business Farmer, Mt. Clemens, Michigan.

MAY

MAY shall make the world anew;
Golden sun and silver dew,....
Money minted in the sky,
Shall the earth's new garmernts buy.
May shall make the orchards bloom;
And the blossoms' fine perfume
Shall set all the honey-bees
Murmuring among the trees.
May shall make the buds appear
Like a jewel, crystal clear,
'Mid the leaves upon the limb
Where the robin lilts his hymn.
May shall make the wild flowers tell
Where the shining snowflakes fell;
Just as though each snow-flake's heart,
By some secret, magic art,
Were transmuted to a flower
In the sunlight and the shower.
Is there such another, pray,
Wonder-making month as May?
—Frank Dempster Sherman.

THE PRISONER AND THE FLOWER

THERE is a beautiful story in French of a prisoner who became attached to a flower. He was put in prison by Napoleon because he was supposed to be an enemy of the government. Walking one day in the yard adjoining his cell, he saw a plant pushing up between the stones. How it came there he could not tell. Perhaps someone carelessly dropped the seed or perhaps it was blown over the wall by the wind. Charney (for that was his name) felt a great interest in the little plant, and spent much time looking at it. He soon saw some buds. He watched them as they grew larger and larger, and longed to see them open. And when the flowers came at last, he was filled with joy. They were beautiful and with a delightful fragrance.

He guarded the plant with great care from all harm, and one day shielded it from a hail-storm by bending over it as long as the storm lasted. It was something more than a pleasure and comfort to him, for it taught him some things that he had never learned before—although he was a very wise man. As he watched the development of the plant—it taught him more than he had ever learned from the wise men of the earth, it taught him that there was a God. He felt that no one but God could make that flower.

The plant proved of great service to him, for the Empress Josephine hearing of his care and love for the solitary little plant in the prison yard, and being a great lover of flowers herself, interested herself in his behalf and persuaded the Emperor to grant him his freedom.

And when Charney left the prison he took the plant with him, for he was loth to part with the little companion of his prison life, that had taught him such lessons of wisdom.

THE GARDEN LETTERS

First Prize

I WANT to tell you something about my plans for this season.

I belong to that class that are renters and it is necessary to move now and then. Most landlords have other things to think of besides setting out shrubbery and building fences to keep out the chickens, and tenants often say, "Well, who knows whether I will be here another year so if the pigs rut up the front yard and the horses and cows eat off the shrubbery and flowers, all well and good."

I like pretty things and do enjoy flowers and it surely doesn't cost a penny to keep the pigs and the cows and horses in the pasture. I want flowers for my tables and I want my children to grow up to enjoy nature and be happy and how else can this be taught better than working with clean surroundings. and flowers.

Now for our campaign. We thoroughly clean the yard. We have so much shade in front that our flowers are in the back part of the yard.

On the east side of the house about two feet from the foundation, we will spade up along the house to put in our dahliais, a few gladilious and later set in asters. We will also do the same on the west side. On the West side is a porch and we are planting morning glories here.

We build a trellis of several feet to hide the toilet and here plant climbing nasturtiuns, then we have beds of zinnias, maragolds, 4 o'clock. We have blossoms till frost, and all hardy enough that the chickens won't bother much after they get a start, until then we cover with brush. We also have a big vegetable garden. We always buy most of the garden seed and a few flower seed, but this year all we will be out is a few nails and a package of climbing nasturtiuns.—Mrs. M.

Second Prize

MOST everyone loves to see a beautiful lawn in the summer, and I know of no other place which can show the more beautiful and artistic landscape work than in the country.

The first thing to do is to rake your lawn thoroughly and free it of the small branches and other things which might have blown there during the winter, and if you are a lover of flowers, the following suggestions might add a wonderful appearance to your home.

Make a round flower bed in the middle of the lawn of Canna flowers use as a border, Forget-me-nots, or middle sized stones. For a handsome and showy display they are unrivaled. And if you do not happen to have permanent hedges, for a border around your lawn, buy a small package of Four-o'clocks, they are a handsome plant, grow very rapidly if properly taken care of. At full growth they are about two feet high, covered all summer with hundreds of bright colored, showy, sweet scented flowers.

Or, if you do not care for these, you might buy a small package of Kochra or Summer Cypress known by either name. This annual plant grows rapidly, at full growth two feet high. The leaves, very slender, of light pea green, until fall, and then changing to blood red, either plants are very beautiful for stationary borders.

And for a flower bed in front of the house, I suggest, sweet peas, pansys, a flower of the smaller type, and if you have rose bushes, don't forget to trim them this spring, also the shade trees if any and don't neglect to keep your lawn cut this summer.

The next thing is how we are going to improve our vegetable gardens. Most every farm home should have a small garden near the house separately from the one in the fields. I suggest that you have a border of astors around the garden. This looks very beautiful, especially when there is green onions, lettuce, beets, carrots, etc., vegetables of the smaller type, and don't forget to keep those horid weeds out of sight. You not only beautify your garden, but also your home, having a vase of astors on your parlor table. At the most, these flower seeds would not cost over fifty or sixty cents, and with a little labor, your home can be wonderfully improved. — Florence Hondorf, R1, East Lansing, Mich.

Third Prize

I WONDER if any of our readers have tried planting Four-o'clock seed to beautify their door-yard? I spaded a strip about 3 feet wide close to the house at the front and along one side and planted the seed as soon as ground was warm, also put a row at the side of the lawn near the drive-way, and stretched a string across until plants were well started this keeps people from driving on front lawn. It does not seem very long until we have a mass of beautiful blossoms which open every day about four o'clock and bloom until about noon the following day. These varicolored flowers will continue to bloom after most others have died, and frost often finds them still giving pleasure to all who love flowers. This seed can be had from any seed firm and costs very little. The plants are hardy and if too thick can be transplanted.—Grace Phare Davidson, R2, Fenton, Mich.

HOW TO MAKE STAIR RUG

I WILL tell how my sister made a good stair carpet that has been in daily use for about thirty years and is not worn out yet.

She cut burlap as wide as she wanted the carpet to be, when it was hemmed on the sides, then with a big hook, pull rags through the meshes. Cut the rags about two inches long and one half inch wide. Pull one end through half its length, then miss two threads of burlap and pull the other end of the rag through so they will be of equal length on the top side. Have the rags not over one half inch apart the closer together they are the better it will wear. Do not trim the top. My sister used sacks that had been covers for sugar sacks. She used hit or miss rags. If one wanted to make it more fancy one could run a white thread along the side about three inches wide the length of the carpet and use one color for that. It takes a lot of rags to make it.—M. S.

THE FARM-WIFE MAKING EXTRA MONEY

THE woman on the farm who feels she can spare the time from her family and household duties has every right to try and increase the family income. There are a great many ways that this can be accomplished.

I have received a great many letters telling about crocheting and tatting. This is a very good way and a pleasant one.

For the women folks that live near a town of any size at all, the raising of chickens and selling the eggs and making good fresh butter, has always been a safe way to make money. In our town there are quite a number of women who bring in fresh things from their gardens and sell it to a number of customers that they keep supplied from week to week. Just think of the amount of rhubarb that is starting up right now and when the flower season starts, sell pretty bunches of them. It is surprising how much money can be obtained this way.

I would like very much to receive any letters telling how some of our women folks that live away from the towns can make a few extra dollars. If you have an idea pass it on and help others with the good suggestion. A letter came into my office from Illinois and I thot it so fine that I am giving it to you.

Making Money At Home—Velvet and plush hats and Tam O'Shanters for little girls. I usually earn from $125 to $150 every fall by making little hats and tams for girls from 1 to 12 years old. I buy remnants of all colors during spring and summer of plush and velvets, fancy trimmings and tassels, by watching for special sales. I live near a city where there are two factories who make uniforms and lodge regalias and can buy small pieces by the pound of velvets and plush and linnnigs. By cutting the Tams in eight section pieces, also so many little hats are made with 6 sections and turn up rim. I also make a square top hat, always using up small pieces. Linnings are cut same as outside but of cheaper material in cotton goods. Bands are trimmed with a narrow beaded or fancy braid. A button mold covered with velvet at top and a nice tassel complets the hat or Tam. Red and black, orange and black, gray and blue, purple and gray are nice in two colors, then I also make them in solid colors of red, green, purple, black, blue, gray, etc. I usually cut my own patterns and watch for new ideas. In September and October I go to town or city with a large box usually 20 or more hats in box and stop at any house where I see little girls. I can only go Saturday afternoons when girls are not in school and usuually sell 8 or 10 and more at $1.00, $1.25 and $1.50 each. I live on a farm and am 60 years old, so I think I do fine. My hats and Tams are well made and tasty of good materials. I have made and sold them for 5 years. and can always sell again to same customers, who wait and watch for me. Any woman who is handy and tasty could make them for her own family and friends and thus save many dollars. I make them any spare time I have and by fall I have them all ready. If one lived near town they could go and sell after school. One can buy hat patterns at any pattern counter, or perhaps our Editor would furnish some.—Mrs. M.

—This article on making money at home is a good one and would like very much to thank Mrs. M. and hope more of our readers will pass along their ideas on how to make extra money.

GET YOUR FAVORITE RECIPES AND HOME REMEDIES READY

FOR Mr. Slocum has promised that if I secure enough, home-tested recipes and home remedy prescriptions, The Business Farmer will publish them in book form exclusively for our readers. I cannot tell you all the particulars in this issue, but I do know that we are going to give some recognition to the sender for each recipe published so I want you to get together your very best cooking, baking or canning recipes and your home remedy prescriptions. Just the ones that have been passed along in your family or you have used successfully for years.

I'll tell you more about this plan in the next issue, but do start getting your very best recipes ready for me. Joyfully,

MRS. ANNIE TAYLOR.

Mothers Problems

PERSISTENCY PAYS

PERSISTENCY pays—in bringing up children as well as in anything else. Many a mother has started her baby out right in life by studying every available authority on baby care and doing nothing for her child which would not come under the head of "scientific care and feeding." She has brought her baby safely through those all important first weeks of his life; she has seen him safely through his first summer, and breathed a sigh of relief when the first set of teeth has been entirely cut. And then—oh, how many times it happens!—she seems to think he has got past the period when care must be taken with him. She grows careless about the food he eats, about the condition of his stomach and bowels, about his hours of sleep and the amount of excitement to which he is "treated." The child now, she thinks, is, in a measure, big enough to take care of himself!

But no child is big enough, either at four or five or six, to take care of himself, and decide what he should eat, when he should go to bed, and how many nights he shall be up late. To have as healthy school-age children as you have fat babies, there is but one rule to follow, and that is, "keep everlastingly at it!" Don't grow lax in the care of the older ones! Train them in right eating habits so that they may not become one of that vast army of undernourished children that fill our public schools! Insist upon the early bedtime hour that nerves may not be shattered by too-little sleep. Throw windows wide at night that lungs may be filled with health-giving, health-keeping oxygen while the children sleep.

Even though your children rank high in physical examinations, even though you know they are exceptionally well, don't relax in your efforts to maintain that fine standard of health. Keep at it, at it, at it! Your duty is not done when you have seen your children safely through babyhood, nor is it done when they are safely launched in childhood. Your goal is, or should be, strong, healthy, vigorous men and women. Persistency alone will fulfil that ambition. Persistency pays!—Margaret Bartlett.

The Runner's Bible

Our lives are hid with Christ in God (Col. 3:3). We dwell in the secret place of the Most High (Ps. 91:1). His presence shall go with us (Ex. 33:14). So shall we ward off the fiery darts of evil (Eph. 6:15-18), and need not fear what man can do unto us (Heb. 13:6). We shall be safe and can enjoy peace of mind thruout the day. We shall learn, too, that by thus daily seeking the kingdom of God, not only will things be added unto us (Matt. 6:33), but that understanding, will rapidly increase because Truth will be more and more revealed. If we desire the Truth which is the remedy for every inharmonious condition, seek it with love and kindness and do not be afraid to face the bare facts.

Personal Column

Little Girl In Trouble—Your case is truly a sad one and I am afraid you will have to make the best of it by smoothing out the road with your own loving kindness. The law is that you are under age until eighteen and if you went away, your father could bring you back or send you to some school for delinquent girls. The old clothes do not mean much for unhappiness, because we all have sometime or other had a dress made over from an older sister or aunts, so little reader do not feel badly about the made over clothes. You really are young to go to dances and it is alright so long as your father is with you. I would suggest your finding some girls your own age and try associating with them. Invite them to your home. What you need is the help and companionship of some good neighborly woman and I hope you will find her. Write again.

This is a lesson for the parent readers of M. B. F. Don't put too many burdens upon our young folks and cheat them out of their childhood. It is a big problem to know how and when to scold a girl or boy of tender years, especially between the ages of twelve and eighteen. Their minds are developing fast and they need courage and lots of attentions to guide them for their future life. The girl of twelve or fourteen who works too hard at home is spoiling her future life as a mother and wife.

Request—I should like to hear from any reader who likes to piece quilts. I have some nice gingham and percale quilt pieces, more than I shall ever use. I would exchange for anything useful. —Mrs. G. W. Morgan, R. 3, Vicksburg, Mich.

Making Blankets Over—Use your thin outing flannel blankets inside of quilts in place of cotton. If double blankets are used, thin at foot and fold so thin part comes in center.—Mrs. G. W. Morgan, Vicksburg, Mich.

Briar Rose—The poem "Briar Rose" was sent to Mrs. M., and she wants to thank the subscriber who sent it in and hopes to return the favor.

Sleeveless Sweaters—I should like to receive the address of lady who makes sleeveless sweaters. —Mrs. G. M.

Canning Horseradish—I carefully clean a quantiy of horseradish roots and grind them very fine with my food chopper. I fill a quart can nearly full and add four level tablespoons of granulated sugar, one teaspoon of salt and fill the can full of good vinegar. This will keep a year if kept in a dark place.—F. A. B.

One Year's Subscription for Mrs. M. E. S.—Mrs. M. E. S. has won a year's subscription on her garden letter and if we can have your full name would be glad to award it to you.

Absent—Why did he leave me,
Could I put forth my arm and stay him—
I would not for its God's decree,
Man must work out his own destiny.

If I could but aid him now,
My sorrow would be less, my happiness more,
I'll let go. God can have him as before.

Thoughts are mighty, Truth works in Unity,
Vibrating through ethereal space,
In one grand symphony.

Prophets, Seers, Illuminati,
Voiced this long before,
Many in body, but One in mind,
Present forever more. — Baker.

—This poem was sent in by a reader of M. B. F.

—A letter asking for recipe for canned meats came into our office and the following is from a subscriber. It sounds real good.

CANNED SAUSAGE MEAT

Here is a recipe a subscriber sent in and says it has always proved successful. I have kept sausage canned this way until Fall. Grind and season meat to taste as soon as possible after butchering so that it has no chance to taint. Stuff in links or make little pats not too thick, and just large enough to go into a quart or two quart can. For a small family one quart cans are better as the meat soon taints after it is opened. Fry sausage in frying pans on the top of the stove. The sausage should be fat enough to make half the grease required. If not, melt lard. Watch carefully and turn so that it does not burn. Fry until done and not too brown. It is then ready to put into cans that are ready, of course. Cans should be packed with sausage up to the shoulder. Pour the grease from frying pan into a small granite pan which should be kept hot on the stove. Then rinse the frying pan with boiling water to get the brown liquid. When this boils fill the can half full, then fill remainder of can with hot grease from the little pan and cover sausage with grease as the grease must cover the sausage to keep. If you have plenty of grease, all grease can be used to fill cans. It is then ready to seal.

Heat oven as for baking and cover the bottom of granite baking pans with sausage and roast in oven. Watch carefully so that they do not burn, and take pans out once and turn so that all sides are browned alike. Then put into cans and do the same as above recipe. The meat will have a better flavor by this recipe. It will keep just as well. Have tea kettle filled with boiling water while canning and can all sausage hot.

Sliced meat can be canned in the same way.

—I would like very much to secure the names of people who have Buff Cochins, Partridge Cochins and Bantams to sell and their prices for same.—Mrs. Hazen Miller, Route 2, Wheeler, Michigan.

Dear Mrs. Taylor—We have had sickness all winter and are very much in need of clothing. We have two little boys, age 4 years and one 4 months. We are trying to raise our children the best we know how. If any of the readers have any garments that would help, they would be very much appreciated.—Mrs. J. C.

—Any reader that will help Mrs. J. C., can have her address upon request.

Some time ago I noticed a request for a method of removing rust stains. The lady was told to use lemon juice and salt and place in the sun. I have found that it is much easier and quicker to place the spot over the top of a steaming teakettle after dipping in the solution of salt and lemon juice. If very bad it may need a second dip. The spot will disappear in a very few moments. Ink spots may be treated the same way and then washed in the usual way to remove the color in the ink. Or they may be washed first to remove the color, then the yellow spot that is left removed with the salt and lemon.

Will some reader tell me how to mend broken dishes so that they will stay mended even when washed in warm water. I read a way to do it once with alum or ashes or both but lost the article. Also wish to ask if any of the readers have had experience in shipping rabbits or other animals to the food and fur companies in New York City and Kansas City, Mo., who offer to buy all you raise if you buy stock of them.—Mrs. E. W. B.

—Can any reader answer these questions?

The article written by Margaret Bartlett was very interesting to me. Only one thing could have made it more perfect; had the mother explained to the daughter, she was sorry she was even momentarily angry, as the daughter was suffering for a mothers mistake.

I have two daughters woman grown and we are just pals together. There has been no misunderstandings. If a difference of opinion arose, it was easily explained, because of our great love for each other. This is a secret, Love is the connecting link (not disconnecting) every time. Where love is first, there is no discord. One daughter is an artist, the other a valuable cashier for a large firm, and when they return home we trio are arm in arm as heretofore, and often they say to me, Mother, you are as young as we are, thus we have happy times together.

So much happiness is in store for us if we are not oblivious of it.

You mothers that think your heart is breaking, yes and fathers too, go within yourselves and find that glorious calm, that serenity of peace that is ever there, and see only the wonderful beauty in your sons and daughters and rest assured it will come forth and love you. This I know from my own splendid daughters. Love fulfills everything.—L. Baker.

RECIPES

CANNING SMALL FISH

"All fish must be absolutely fresh for canning. Do not attempt to can fish that has been dead more than a few hours, for it deteriorates very quickly.

"To prepare fish, scale or skin, remove head, fins and entrails. They will scale more easily if dipped for a moment into boiling water. If they are large, remove back bone. Soak fish in brine made of 2 tablespoons salt to 1 quart water, from quarter of an hour to an hour, according to the thickness of the pieces. This draws out the blood. Drain, out into lengths or pieces desirable for packing and serving. Pack into jars, add hot brine made of 1½ tablespoons of salt to 1 quart of water. Partially seal, process pint jars 60 to 90 minutes of 15 lbs. steam pressure, seal. Canned fish may be served boiled, with sauce, rolled in meal or crumbs and fried, baked and basted with butter, deviled, scalloped, crouquettes, fish cakes, salads and in many other ways. The above directions may be used for all varieties of fish."—Mich. Agri. College.

RHUBARB CONSERVE

Many people have more rhubarb in their patch than they can use up in sauce for immediate consumption. Why not convert this into conserves? The following recipes are good:

Rhubarb and Prune Conserve

One quart rhubarb cut in small pieces.
One cup prune pulp.
Three cups sugar.
One lemon, juice and grated rind.
One-half cup English walnuts, chopped. Cook the rhubarb, the prune pulp and the sugar until the mixture is thick. Add the lemon juice and rind and the nuts. Cook slowly until the conserve has a rich, red color.

Note—One cup chopped raisins may be added.

Rhubarb and Pineapple Marmalade

Three pounds red rhubarb.
Two pounds sugar.
Two lemons, juice and rind grated.
One cup grated pineapple.

Cook the mixture slowly until it is thick and clear. Turn into glasses and seal.—Home Economics, Colorado Agricultural College.

RHUBARB SHORTCAKE

Mix and sift together two cups of flour, four teaspoons of baking powder, one-half teaspoon of salt and two-tablespoons of sugar. Rub in one-third cup of shortening and add one egg and enough milk to make a very soft dough. Spread the dough evenly in two small greased layer cake pans and bake in a hot oven—400 degrees—for ten minutes. Remove from pans, cool slightly. Spread stewed rhubarb very thick between and on top of the layers and serve with hard sauce, custard sauce or whipped cream.

RHUBARB JELLY

Wash rhubarb and cut into small pieces. Mix with just enough water to keep the rhubarb from burning. To each pound of rhubarb add juice of one orange and one lemon and the finely-chopped rind and inside white peel. Cook slowly until tender and pour into a jelly bag to drip. When all the juice has dripped through, measure and allow one pound of sugar to each pint of juice. Heat to boiling point and boil five minutes. Add sugar and boil until the mixture jellies from the spoon. Pour into sterilized jars and seal with paraffine.

—if you are well bred!

In public—only in crossing the street the boy takes a girl's arm.

The man always walks on the outside, even walking with two girls or more girls.

Always acknowledge acquaintanceship with bow or slight smile.

When in town do not walk more than three abreast on the sidewalk.

Patterns will be found on page 18.

Royal Gasoline Irons have already abolished the drudgery of ironing for over 1,000,000 women.

They require no stove fires, gas tubes, or electric cords. The heat is generated in the iron itself.

Handsomely nickel plated. Attractively designed. Inexpensive to operate. Ready at a moment's notice.

Deaf Can Hear Says Science
New Invention Aids Thousands

Here's good news for all who suffer from deafness. The Dictograph Products Corporation announces the perfection of a remarkable device which has enabled thousands of deaf persons to hear as well as ever. The makers of this wonderful device say it is too much to expect you to believe this, so they are going to give you a chance to try it at home. They offer to send it by prepaid parcel post on a ten-day free trial. They do not send it C. O. D.—they require no deposit—there is no obligation.

They send it entirely at their own expense and risk. They are making this extraordinary offer well knowing that the magic of this little instrument will so amaze and delight the user that the chances of its being returned are very slight. Thousands have already accepted this offer and report most gratifying results. There's no longer any need that you should endure the mental and physical strain which comes from a constant effort to hear. Now you can mingle with your friends without that feeling of sensitiveness from which all deaf persons suffer. Now you can take your place in the social and business world to which your talents entitle you and from which your affliction has, in a measure, excluded you. Just send your name and address to The Dictograph Products Corporation, Suite 1302Y, 220 N. 42nd St., New York City, for descriptive literature and request blank.

Before you buy an Engine, Separator, Spreader or any other machine get Galloway's new low prices, save one fourth to one half. 300,000 pleased customers testify to faultless designs, best materials. Satisfaction guaranteed. Send for new 1923 catalog

Registered Holstein Cattle—15 bulls with 7 and 365 day record backing. Five of the bulls are sired by Sir Pietertje Armsby Mercedes 40th and six by Charleviox Marbury.

19 Females—15 of them bred to the best Holstein bulls in the state. Four open.

20 Registered Duroc-Jersey Hogs—17 bred sows—6 bred to TOPMAST SENSATION—3 young serviceable boars.

Belgian Horses—1 pure-bred stud, 2 grade geldings and 2 grade mares.

LOEB FARMS, Charlevoix, Mich.

DAIRY and LIVESTOCK

SPRINGTIME IS PIGTIME

SPRINGTIME is pigtime on most farms. It is the season when more can be done than at any other time of the year to make pork production profitable, for a pig well started may be said to be well on the way to market. After he is a few weeks old and has successfully passed the weaning period he is pretty well able to take care of himself if he is given access to plenty of the right kinds of feed. Therefore, says the United States Department of Agriculture, we should take particular care at this time in order to make the job easier later in the season and the profits greater. A pig that grows well from start to finish is always the desirable and most profitable one no matter whether the price of hogs is high or low.

It should go without saying, although, unfortunately, it still needs repetition, that first of all the pig in order to be profitable must be well bred and of good type. He must have in his veins the blood of animals that have had the capacity to turn a minimum quantity of feed into a maximum quantity of meat. But even a pig starting with these advantages may be a poor piece of property if he is badly handled or if fed improperly. He may get a bad start in competition with his litter mates; he may be stunted at weaning time; worms may sap his vitality; the pasture provided may be insufficient for his needs; or, if precautions have not been taken, cholera may whisk him to an untimely and unprofitable end. But among these possibilities there is none that can not be guarded against.

The opinions of hog raisers vary widely as to the age at which pigs should be weaned. Some of them take the youngsters away from their mothers at 5 weeks, others at 12 weeks, while still others may make them shift for themselves at any age between these extremes. In exceptional cases breeders will leave pigs with the sows even when they are more than 3 months old. Unless there is some special reason for so doing, says the department, pigs should not be weaned until they are at least 10 weeks old, and a sow that will not suckle her litter for this period is undesirable as a mother and should be discarded from the herd.

Some farmers and breeders wean the pigs at an earlier age in order to get two litters a year. The department considers it better practice to give the pigs a stronger start and raise only 3 litters in 2 years. It is better to raise fewer pigs and have them well grown than to raise a larger number and have many of them stunted.

When a litter is to be weaned attention must be given to the sow's condition as well as to the pigs. To bring about a favorable condition for weaning, the quality and quantity of her feed should be reduced for 4 or 5 days before the pigs are to be taken away. This will result in a reduced flow of milk and tend to prevent udder troubles. The sow should be removed from the pigs rather than the pigs from the sow; the youngsters being left in the quarters to which they are accustomed and having access to a self feeder which they should have learned to use several weeks earlier. In case a sow's udder after she has been taken away becomes so distended with milk that it is painful she may me returned to her family for a short time for relief. It will seldom be necessary to return her more than once.

When the pigs are weaned do not change the ration. Leave them on good pasture, with access to the self feeder containing corn and shorts or middlings. If during the suckling period or after skim milk or butter milk is added to the ration, commence feeding it in small quantities, gradually increasing it from day to day. Sudden changes are always to be avoided.

Something may as well be said here concerning the question of raising 2 litters a year, since it is closely related to weaning. Just what a hog grower's practice should be depends upon his geographical location, his equipment for handling pigs during winter, and the kind of farming he is doing. Fall pigs require a great deal of attention and most farmers are not prepared to care for as many at this time as in the spring. In the northern half of this country pigs should not be farrowed after October 15 as they must have a good start before severe weather sets in. A large percentage of spring pigs are farrowed in March and April and most of the fall pigs come in September and October.

If a sow farrows March 15 and the pigs suckle 10 weeks they will be weaned May 24. If the sow is in good condition she may be immediately rebred, that is within 3 or 4 days after the pigs are weaned. If she were rebred on May 28 she would farrow again about September 16, and the pigs would be weaned November 25, making possible rebreeding for March 20 farrow. It is not always possible, however, to keep to such a schedule, and the raising of 2 litters a year and having them all come at the proper time is impossible. If, however, the pigs are allowed to suckle 10 weeks it should be easily possible for a sow to raise 3 litters in 2 years, and it is probable that more profit would be made this way than by crowding the sows too hard.

TWO NEW CHAMPIONS IN MICHIGAN

TWO Michigan Holsteins have outclassed former records of production for their age and length of test making them new state champions, one of them taking first place in two divisions.

Canary Maid Prometheus Champion is declared highest producer in Michigan as a senior three-year-old in both the seven day and thirty day division.

She is owned by the State Hospital at Newberry. In seven days she produced 674.5 pounds of fat or 34.87 pounds of butter. Her thirty day record is 2639.1 pounds of milk and 106.796 pounds of fat or 133.495 pounds of butter.

Segis Cornucopia Pauline, owned by W. C. Cornwell, Saginaw, Michigan, is a third new state champion. At full age in the ten months division she produced 22832.8 pounds of milk and 766.71 pounds of fat equal to 958.38 pounds of butter.

PRIZE COW AT M. A. C. SETS NEW MILK RECORD

PAULINE Jane Pontiac, a pure bred Holstein-Friestian cow owned by M. A. C., has set a new high mark for seven-day milk and butter fat production among all the state agricultural college herds in the United States.

She produced 731.1 pounds of milk, containing 36.58 pounds of 80 percent butter in the seven days of her official test.

That Pauline's performance is merely the result of careful breeding is pointed out by J. E. Burnett of the M. A. C. dairy department, who supervised the testing. Pauline was sired by Pauline Sir Pontiac, one of the best of the M. A. C. herd.

Another of his daughters, Pauline Segis Fayne, produced more than 21,000 pounds of milk as a junior two-year-old and still another, Pauline Colantha Fayne, produced 19,800 pounds of milk at the same age.

VETERINARY DEPARTMENT

HORSE HAS POLL EVIL

I have a horse four years old with a sore about as big around as a small lead pencil located in the edge of maine, about four inches behind his ear. It runs probably two tablespoons of thick yellow pus in twenty-four hours. Has been like that for sometime. Am of the opinion that there is a pipe in there. It isn't sore in the least around it and the horse acts all right and is doing well. What would you advise me to do for it?—H. B. H., Brant, Mich.

—In all probability this horse is suffering from poll evil, a disease which causes necrosis of the anterior part of the ligament that passes along the top of the spine of the cervical vertebrae. Two methods of treatment are commonly used by veterinarians for this disease. The one is to enlarge the opening and pack it with a fistula paste which is left in position for about a week or until the pipe or fistulas canal sloughs out. The wounds is then allowed to heal by second intention.

The other method of treatment and the one that proves most successful in the majority of cases is a surgical operation which consists in removing the diseased portion of the ligament. I would advise you to put your horse under the care of a competent veterinarian for treatment.—John P. Hutton, Assoc. Prof. of Surg. and Med., M. A. C.

SHEEP HAVE ACUTE INDIGESTION

I am writing to you in regards to my sheep and hope you will please inform me what to do. The sheep refuse to eat, stand around and stretch their front legs out forward and the hind legs backward, and the back seems to cave in. Some live a week and some longer. Urine alright but no bowel passage. None have lambed but are with lamb. Thought at first that was the trouble but the bucks are the same as the ewes. I am feeding fine timothy hay and alsike clover mixed. I have fed bean fodder. They have plenty of salt and I am feeding bran and linseed meal.—A. P., Gladwin, Mich.

—From the symptoms which you describe, I believe that your sheep are suffering from some form of acute indigestion. This may be due to some spoiled or mouldy feed, or it may be due to timothy stalks irritating the bowels, or even penetrating them, as they sometimes do.

I would advise that you give each one of these sheep about one-half pound of epsom salts as soon as the trouble is discovered, remove the timothy hay from the ration, and feed only clover hay and bean-fodder as roughage.—Geo. A. Brown, Prof. of Animal Husbandry, M. A. C.

COW SUFFERING FROM CHRONIC MASTITIS

I have a cow, 3rd generation from purebred bull. She gave a good lot of milk twice a day. Unusual for this county. Toward end of her milk season her milk got a little stringy in right hind quarter. I milked her out good for sometime, after about 8 weeks dry she calfed. Always was an easy milker, now that same quarter gives a small stream of milk, milks very hard and seems to be sore and tender. Can you advise me?—C. M.,Roscommon, Mich.

—The cow is suffering from chronic mastitis, a chronic inflamation of the gland of that quarter. The Treatment of cases like this is often very unsatisfactory. Milk out the affected quarter every two hours, message well with a mixture of sweet oil, one ounce; turpentine, one dram; and fluid extract of phytolacca, one dram three times daily. Give internally one ounce of artificial carlsbad salts night and morning for two weeks. If you have a good veterinarian in your locality I would suggest that you put the case in his hands and let him treat it as he will be able to treat the case much more satisfactorily than can be done by mail. —John P. Hutton, Asso. Prof. of Surgery and Medicine, M. A. C.

SYMPTOMS OF PIN WORMS AND BOTS

I would be pleased to know what are the symptoms of worms in horses, both pin worms and bots, also what is best to rid them of same.—C. M. R., Elkton, Mich.

—Pin worms (Oxuris curvula) are parasites that live in the large intestine of the horses. Frequently they are found in the rectum where they sometimes produce irritation and cause the patient to rub the root of the tail and buttocks. Sometimes as a result of catarrhal inflamation of the rectum a layer of white or yellowish dried exudate is found about the anus.

Bots affect principally colts and young horses which have been running on pasture during the summer. During the winter when the animals are stabled and on dry feed they become unthrifty and show poor appetite, sometimes intermittent attacks of colic. Edematous swelling commonly appears between the jaws. Where the invasion has been very great the patient eventually becomes very much emaciated.

When the parasite (Gastrophilus hemorrhoidalis) is present in the rectum it may cause the patient to become restless and rub its tail frequently. Whitish dried crusts sometimes appear about the anus.—John P. Hutton, Associate Prof. of Surg & Med., M. A. C.

COW GIVES THICK AND STRINGY MILK

Would like to know what to do for my cow. Her milk is thick and stringy from one quarter of her udder. She has been fresh about two months. She gets three quarts of ground oats twice daily and mixed clover and timothy hay. She is in fairly good condition.—G. M. P., Mackinaw City, Michigan.

—This cow is suffering from mastitis the treatment of which is very often unsatisfactory. I would suggest that if possible you put the case in the hands of a good veterinarian if there is one in your locality and let him treat it. It is usually very unsatisfactory to try to treat a case of this kind by mail. If you, however, do not have a veterinarian in your community and will write and give me the particulars about the case I will be very glad to help you in any way that I can.—John P. Hutton, Assoc. Prof. of Surg. and Med., M. A. C.

NEW MICHIGAN HOLSTEIN CHAMPION

TRAVERSE Echo Sylvia Walker, a Holstein cow owned by the State Hospital at Traverse City, is declared new state champion producer in the junior two year class for production of butterfat in thirty days. This cow produced 2300.0 pounds of milk and 80.453 pounds of butterfat according to official announcement from the Advanced Registry office. This butterfat production equals 100.56 pounds of butter.

The new champion takes the place of Eden Hope, owned by G. W. Ridgeman at Vassar.

LIKE AMERICAN BUTTER BETTER

OVER fifty percent of the butter now imported into the Dominican Republic comes from the United States, while until three years ago 90 percent of the butter importations into that country were of European origin, a report from Mr. Francisco Fiol of the American Consulate at Santo Domingo informs the Department of Commerce. It is believed that American dairy and nut butters will have an increasing market in the Dominican Republic provided that they are given due publicity in papers pamphlets, calendars, etc.

THE EXPERIENCE POOL

Bring your everyday problems in and get the experience of other farmers. Questions addressed to this department are published here and answered by you, our readers, who are graduates of the School of Hard Knocks and who have their diplomas from the College of Experience. If you don't want our editor's advice or an expert's advice, but just plain, everyday business farmers' advice, send in your question here. We will publish one each week. If you can answer the other fellow's question, please do so, he may answer one of yours some day! Address Experience Pool, care The Business Farmer, Mt. Clemens, Mich.

CAN YOU SUPPLY THIS INFORMATION

Has any reader ever used the well boring outfit put out by the Specialey Device Co., Cincinnati, Ohio? Did it give satisfaction? Did it do all they claim it will do? I will thank anyone for any information concerning this outfit.—J. W., Mich.

WART REMOVER

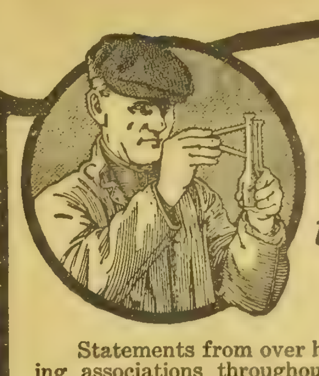
I would like to suggest a remedy for warts in the case of Mr. F. H. B., Cheboygan. If he will saturate the warts thoroughly with Castor oil every two days for a couple of weeks I think they will disappear. It might not be necessary to continue the treatment that long. I have taken them from cows teats with two applications. A neighbor told me of this 15 years ago. I have used it several times and it has never failed me yet. This will not make sores where the warts were. —Sanford McElhenie, Fremont, Ind.

BEST OF ALL HE READS

I was glad to renew my subscription for 2 years for I read several papers and believe yours to be the best of them all.—Eroul H. Roberts, Chicago, Ill.

Wife—"How many fish did you catch last Saturday, George?"
Husband—"Six, darling—all beauties."
Wife—"I thought so. That fish dealer has made a mistake again. He charged us for eight."

Ike—"Swim out here, fadder I'm sinking."
Abe—"I can't swim. Throw papa your watch and I vill pray for you."—Brown Jug.



~Cow Testers Know that De Laval Separators Skim the Cleanest

Statements from over half the cow testers employed by cow testing associations throughout the United States, reaching over 6000 farms, give additional proof of the superior skimming efficiency of De Laval Separators.

Cow testers know best of all what cream separators are used most, which skim cleanest and last longest, because they regularly test the skim-milk from the separators owned by their members. They say:

—"I find on an average De Laval Separators skim cleaner—from a trace to .04 of one per cent. Thirteen out of nineteen separators here are De Lavals."* (.01 of one per cent equals one lb. out of every 10,000.)

—"Out of 48 separator users 29 use De Lavals. I've found them the best skimmers for the longest time."*

—"26 members have separators, and 22 are De Lavals. They give the best satisfaction after considering all points."*

—"De Laval Separators have no equal for quality and efficiency. 15 out of 20 are De Lavals."*

—"90% of the separators used by my members are De Lavals. The majority skim closer than .02 of one per cent."*

—"The De Laval is a very close skimmer under any and all conditions. 95% of the separators here are De Lavals."*

—"I have 25 members and 18 use De Lavals. I have not had one test below .05 of one per cent."*

*Authorities for these statements from cow testers, together with many others equally good, are contained in a booklet entitled "Cow Testers—What They Do and What They Say About De Laval Cream Separators and Milkers." Send for it—contains information about the value of cow testing associations.

IT Is THE BEST

BINDER TWINE

THE PRICE IS RIGHT

Are you remembering in purchasing your binder twine that you have a factory of your own at Jackson?

It is making the best twine that can be placed on the market and has a mixture of fiber this year. Manila is added to the sisal to give extra strength.

The State Farm Bureau and other organizations and dealers of the state are in position to handle your twine. If they do not, write direct for prices as we want you to use your own twine as we make 14,000,000 lbs. more than Michigan can use.

THIS BEAUTIFUL BRIDAL WREATH

AND 4 OTHER HARDY ORNAMENTAL SHRUBS

Planting a few shrubs this season will soon make your home a beauty spot and a greater joy to live in. Also, if you should later decide to sell it, you will find it more salable and worth a few hundred dollars more. Our collection consists of the following five most desirable varieties. They are not little, greenhouse-rooted cuttings, such as are often given in offers of this kind. These shrubs are all field grown, healthy and thrifty, and are sure to give satisfaction. We would recommend that you accept our special offer without delay, as this offer may be withdrawn at any time.

Beautify Your Home at Our Expense

SPIREA VAN HOUTTEI (Bridal Wreath)—A leader among shrubs, and a beautiful ornament at all seasons. A round and graceful bush with arching branches, covered with white flowers in early summer. No doubt the most useful of all shrubs.

ALTHEA (Rose of Sharon)—A beautiful shrub that nearly everyone is familiar with. Flowers profusely in late summer and early fall, when few other shrubs are in bloom.

Spirea Von Houttei (Bridal Wreath)

Syringa (Mock Orange)

BUSH HONEYSUCKLE—Handsome bush with pink and white flowers in the eary spring, followed by beautiful and showy red berries during summer and fall.

FORSYTHIA (Golden Bell)—The first shrub to bloom in the spring, the golden-yellow flowers appearing before the leaves; frequently while the ground is still covered with snow. Branches cut off in winter and put in a vase of water will bloom in the house.

SYRINGA (Mock Orange)—One of the finest of the tall shrubs. Valuable for backgrounds, screens, grouping and specimens. Flowers white and very fragrant. Beautiful for cutting.

These are the five grandest shrubs for all climates, and will be delivered to you, by parcel post, postpaid, as per our special offer below.

OUR SPECIAL OFFER

ALL FIVE SHRUBS, above described, shipped from our Michigan nursery, direct to your mail box, postage paid and safe arrival guaranteed, for ONE DOLLAR, which includes a One Year New or Renewal subscription to The Michigan Business Farmer. This may apply on your own renewal or add any new name ONE FULL YEAR.

Order of THE BUSINESS FARMER, Mt. Clemens, Mich.

MICHIGAN CROPS

BOOSTING THE FALL WHEAT

ROLLING the fall wheat in the spring, after the ground has become sufficiently dry, has boosted many an unfavorable field of wheat. Packers, that are now a part of the equipment on many farms, are splendid for this work. They pulverize the soil to a finer degree than an ordinary roller, and leave the top of the ground in a condition that is less subject to a crust. They break the crust that is usually forming, fill the cracks, and press the freshly pulverized earth firmly against the roots of the plants. This not only gives the wheat a start but aids in preserving moisture that is often needed later on.

Last year the writer had an opportunity to witness the benefit that resulted from harrowing a field of fall wheat. The wheat had been sowed late in the fall, with very little growing weather following. In the spring it did not appear to be worth leaving; but when a little crust began to form on the top of the ground, and before it became hard, the owner ran over the field with the spike tooth harrows. The impression the harrows made upon the ground did not appear to be sufficient to merit the time spent, the wheat soon began to show improvement, and by harvest time had attained a normal height. This field of wheat, that at one time appeared to be a failure, returned a fair yield; and it payed the owner well for the little time spent in harrowing it.

The reason that rolling or harrowing the fall wheat is not practiced on more farms is because it needs to be done at that time of the year when work is usually crowding the farmer. But, when one can increase the yield of the wheat crop from one to three bushels per acre with so little effort it would be profitable to neglect less important work in order to give the fall wheat a boost.

Running over the fall wheat with the packer or spike-tooth harrows this spring may be the making of the crop.—L. W. Silverthorn.

OAT SMUT IS PREVENTABLE

Would like to get some information regarding treatment of oats and barley smut. Has the State Department of Agriculture a formula for the treatment of oats and barley smut? If they have a formula, will they furnish the anti-smut cure? What would be the cost?—J. A. B., Tawas City, Michigan.

—This disease is caused by a parasitic fungus—a small plant which makes no food for itself but steals its living from the oat. The body of the smut fungus is made up of threads, microscopic in size, which live inside the oat plant, growing up with it, and finally producing its own kind of fruit where the oat kernel should be produced. This fruiting mass of the oat fungus is the brown "smutty" powder. It is made up of the countless thousands of exceedingly minute balls. These balls are the "seed" of the smut fungus. They are called spores.

These seed-like bodies, the spores, are mature at threshing time. They get into the crevices of the grain and adhere to the surfaces. When the grain sprouts, the smut fungus sprouts too, and bores into the young seedling. This is the only period when smut can infect the oats. Once inside, the smut grows as the oat plant grows, keeping pace with its progress. When the oat matures, the smut matures also and completely replaces the normal grain with the "smutty" powder. The seed for next year's crop becomes heavily dusted with its powder during threshing. It is not too much to say that, year in and year out, smut destroys 8 to 10 per cent of the untreated Michigan oat crop—approximately one acre out of every ten planted. This amounts to nearly four million dollars annually.

Prevention of oat smut is possible by taking advantage of the fact that the smut can only enter the grain at sprouting time, the seed grain itself being the source of infection.

Seed treatments kill the spores on the outside of the grain, without injuring the grain itself.

Smut is now so common everywhere that untreated grain gives a heavily smutted crop; treated oats give clean, healthy plants.

Clean the oats of all weeds, chaff, and light grains by means of a fanning mill.

Treat seed oats for smut either by the well known sprinkling method or by the new concentrated formaldehyde treatment.

Mix one pint fresh formaldehyde with 40 gallons of water. Clean a place on the barn floor and sprinkle with this solution. Spread the oats in a thin layer (four inches) and sprinkle with the dilute solution of the formaldehyde. Shovel over and over until every kernel is moist. Add layer after layer, sprinkling as before. Two quarts of solution is enough to allow to a bushel. When all the grain is moistened, shovel into a compact heap, cover two hours with a blanket or canvas, then spread out to dry and air. Do not let the wet grain freeze, mould or sprout.

The grain may be planted as soon as it is dry enough to run through the drill. Make allowance for the slightly swollen condition when planting. One pint of formaldehyde will treat from 50 to 60 bushels.

The treatment may be modified by dipping the grain, one-half to one bushel at a time, in a barrel or tub of the dilute solution. Drain, cover for two hours, dry and the oats are ready for planting.

Formaldehyde Treatment

Use formaldehyde at the rate of one pint to 50 bushels of grain. For smaller amounts of grain correspondingly smaller amounts of formaldehyde. It is unnecessary and unsafe to use more formaldehyde than the amount recommended. Put the right amount of fresh formaldehyde just as it comes from the druggist, into a pint or quart hand spray or atomizer and spray the grain as it is shoveled over and over. If the sprayer is kept close to the grain and if the treatment is given in a room where there is a good draft, the penetrating odor of the formaldehyde will give no discomfort.

When the right amount of formaldehyde has been applied, shovel the oats into a heap and cover for exactly four hours with a canvas or blanket.

The grain should then be spread out thinly for a thorough airing in a warm place. Rake the grain over during this airing, then plant at once.

Wheat, barley and rye may be treated in the same way as for oats.

Injury to the wheat will result if directions are not followed, or if the ragin is allowed to stand after treating. Plant the same day.

With either treatment avoid contaminating the grain with dust from old sacks or from the drill. To disinfect the sacks, soak in formaldehyde, two tablespoonfuls to a pail of water. To disinfect the drill, pour this solution through it.

Ask any druggist for fresh formaldehyde.—G. H. Coons, Botany Department, M. A. C.

White Diarrhea

Remarkable Experience of Mrs. C. M. Bradshaw in Preventing White Diarrhea

The following letter will no doubt be of utmost interest to poultry raisers who have had serious losses from White Diarrhea. We will let Mrs. Bradshaw tell of her experience in her own words:

"Gentlemen: I see reports of so many losing their little chicks with White Diarrhea, so thought I would tell my experience. I used to lose a great many from this cause, tried many remedies and was about discouraged. As a last resort I sent to the Walker Remedy Co., Dept. 687, Waterloo, Iowa, for their Walko White Diarrhea Remedy. I used two 50c packages, raised 300 White Wyandottes and never lost one or had one sick after giving the medicine and my chickens are larger and healthier than ever before. I have found this company thoroughly reliable and always get the remedy by return mail.—Mrs. C. M. Bradshaw, Beaconsfield, Iowa."

Cause of White Diarrhea

White Diarrhea is caused by the Bacillus Bacterium Pullorum. This germ is transmitted to the baby chick through the yolk of the newly hatched egg. Readers are warned to beware of White Diarrhea. Don't wait until it kills half your chicks. Take the "stitch in time that save nine." Remember, there is scarcely a hatch without some infected chicks. Don't let these few infect your entire flock. Prevent it. Give Walko in all drinking water for the first two weeks and you won't lose one chick where you lost hundreds before. These letters prove it:

Never Lost a Single Chick

Mrs. L. L. Tam, Burnetts Creek, Ind., writes: "I have lost my share of chicks from White Diarrhea. Finally I sent for two packages of Walko. I raised over 500 chicks and I never lost a single chick from White Diarrhea. Walko not only prevents White Diarrhea, but it gives the chicks strength and vigor; they develop quicker and feather earlier."

Never Lost One After First Dose

Mrs. Ethel Rhoades, Shennandoah, Iowa, writes: "My first incubator chicks, when but a few days old, began to die by the dozens with White Diarrhea. I tried different remedies and was about discouraged with the chicken business. Finally, I sent to the Walker Remedy Co., Waterloo, Iowa, for a box of their Walko White Diarrhea Remedy. It's just the only thing for this terrible disease. We raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."

You Run No Risk

We will send Walko White Diarrhea Remedy entirely at our risk—postage prepaid—so you can see for yourself what a wonder-working remedy it is for White Diarrhea in baby chicks. So you can prove—as thousands have proven—that it will stop your losses and double, treble, even quadruple your profits. Send 50c for package of Walko—give it in all drinking water for the first two weeks and watch results. You'll find you won't lose one chick where you lost hundreds before. It's a positive fact. We guarantee it. The Leavitt & Johnson National Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of this guarantee. You run no risk. If you don't find it the greatest little chick saver you ever used, your money will be instantly rerfunded.

WALKER REMEDY CO., Dept. 687
Waterloo, Iowa.

Send me the ( ) 50c regular size for ( ) $1 economical large size) package of Walko White Diarrhea Remedy to try at your risk. Send it on your positive guarantee to instantly refund my mony if not satisfactory in every way. I am enclosing 50c (or $1.00). (P. O. money order, check or currency acceptable.)

POULTRY

VERY SUCCESSFUL INCUBATION

Can you give me complete directions on how to hatch chicks from incubator without losing so many large full grown chicks which die in shell? I have trouble every time. I lose about 40 out of 100 chicks or I will say I sat 135 eggs and will test out about 24 and at the end of hatch I usually get about 75 to 80, the rest die. I run a hot water heating system and also one hot air system. How many geese can you breed with one gander? Does it make difference in fertility of eggs if you use your own gander from same flock? Can you incubate turkey and geese eggs?—Mrs. C. A. S., Onaway, Mich.

—Statistics gathered from every part of the state this season indicate that the average hatch has been about fifty per cent. I note you received from 75 to 80 chicks from 135 eggs set and would consider this very successful incubation especially during the months of March and early April. Later in the season when the birds are permitted free range a few dead chicks will be found in the shell and the mortality during the incubation period will be greatly lessened.

Low hatchability of the egg involves many factors. The breeding stock should of course be in the best physical condition. Artifical illumination, heavy protein feeding, and over crowding in damp and poorly ventilated buildings all have a tendency to decrease both fertility and hatchability. Immature breeding stock frequently produces a high percentage of weak germs. The fate of the chick is more easily determined before it is produced and therefore the incubator should not be too severely critized for the resultant low hatches early in the season. Hot water machines are usually the most satisfactory during the early months because the air at that time is relatively dry and the moisture machines, on an average, will produce more successful hatches. Later in the season, however, when the humidity of the air increases the hot air machines may excel the hot water type.

It is unadvisable to inbreed with either turkey or geese as the infertility usually runs much higher and the offspring is often lacking in constitutional vigor. It is not ordinarily advisable to use over three geese with one gander. Both turkey and geese eggs have been successfully incubated by artificial means although it is generally advisable to set the domestic hen early in the season thereby inducing the goose and turkey hen to produce as many eggs as possible. The latter can be used for incubation work later in the season. —E. C. Foreman, Associate Professor of Poultry Husbandry, M. A. C.

REQUIREMENTS OF WHITE WYANDOTTE

Will you please advise me the requirements of a pure-bred White Wyandotte?—S. E. D., Tustin, Mich.

—We are herewith publishing the requirements for the White Wyandotte, as given in the American Standard of Perfection.

Disqualifications: Ear lobes more than one quarter positive enamel white.

Shape: Head: short, round, broad. Beak: short, well curved. Eyes: full, oval. Comb: Rose, low, firm on head, top free from hollow center, oval, and surface covered with small rounded points, tapering to a well defined point at rear; the entire comb conforming to the shape of skull. Wattles and Ear-lobes: Wattles, moderately long, nicely rounded at lower edges, equal in length, fine in texture, free from wrinkles or folds. Ear-lobes, well defined, hanging about one third the length of wattles; smooth. Neck: short, well arched; Hackle, abundant, flowing well over shoulders. Wings: medium in size, not carried too closely to body; sides well rounded. Back: short, broad, flat at shoulders; saddle, broad, full, rising with concave sweep to tail; saddle feathers abundant. Tail: short, well spread at base; carried at an angle of fifty degrees above the horizontal; sickles, moderately long, curving

Rheumatism

A Remarkable Home Treatment Given by One Who Had It

In the year 1893 I was attacked by Muscular and Sub-Acute Rheumatism. I suffered as only those who are thus afflicted know for over three years. I tried remedy after remedy, but such relief as I obtained was only temporary. Finally, I found a treatment that cured me completely and such a pitiful condition has never returned. I have given it to a number who were terribly afflicted, even bedridden, some of them seventy to eighty years old, and the results were the same as in my own case.

I want every sufferer from any form of muscular and sub-acute (swelling at the joints) rheumatism, to try the great value of my improved "Home Treatment" for its remarkable healing power. Don't send a cent; simply mail your name and address, and I will send it free to try. After you have used it, and it has proven itself to be that long-looked for means of getting rid of such forms of rheumatism, you may send the price of it, One Dollar, but understand I do not want your money unless you are perfectly satisfied to send it. Isn't that fair? Why suffer any longer, when relief is thus offered you free. Don't delay. Write today.

REQUIREMENTS OF WHITE WYANDOTTE

(Continued from Page 25)

gracefully and closefully over tail; coverts, abundant, filling out well in front, hiding the stiff feathers. Breast: broad, deep, round. Body and Fluff: Body, moderately short, deep, round; fluff, full-feathered, well rounded. Legs and Toes: Thighs, short, stought, showing outlines when viewed sideways, well covered with short feathers; shanks, short and stout, set well apart, well rounded; Toes, straight.—E. C. Foreman, Associate Professor of Poultry Husbandry, M. A. C.

FEEDING CHICKS AND CHICKENS—SOME OF MY RESULTS

When chicks are first received from the company or hatched by your own hens it is not best to feed them until they are thirty-six hours old, as the youk of the egg provided them with nourishment until they reach this age. Feeding before this time causes many deaths because the system is not ready to receive the food and bowel trouble results.

For their first meal a good feed would be a boiled egg, shell and all chopped fine mixed with three times its amount in bread crumbs. After a week or two a more sutiable food for growing chicks would be rolled oats or screenings. Chicks need water constantly in summer and winter. Green fed is used as an appetizer.

After the chicks are a month old they need heavier food to build up their systems. Along with this heavier feed a soft mash should be fed. The ratio being one feed of soft buttermilk mash to every two feeds of grain.

Chicks must have animal feed, when they are on free range they can pick up bugs and worms themselves, but if they are confined you must give it to them in the form of meat scrap. Another thing they must be provided with, if confined it needs chick size grit because it is important to help them digest their food. Fine scratch sand should be provided for them if it is not possible to get grit.

After the chicks have been reared cracked corn and wheat give excellent exercise, if fed in litters from 3 to 6 inches deep so they will have to scratch for it. Hens cannot get too much exercise for if they don't have to work they get too fat and can't lay.

By feeding my chicks in this way I have raised them by having only eight deaths out of eighty. My hens have produced in the month of January, 214 eggs; February, 460 eggs; and March, 1,002 eggs, making a total of 1,676 eggs. Of these I have sold 128 dozens, besides using in our home 11 2-3 dozens and selling two settings at $1.00 each. Selling the 128 dozens at an average of 40c. I have received $55.73 and $2.00 for setting making a total of $57.73. The feed used amounted to $23.45, netting me $34.28.—Grant Gallup, Member Boys' and Girls' Club, Iron County, Mich.

CULLING HENS

In many flocks a large loss is maintained every year through the keeping of unprofitable hens and it is important that culling be done regularly, but to do it right is the important thing. The two common methods resorted to for culling hens is to sell off those that have the rough, scaly legs whether or not their age is known. Scaly legs instead of indicating age, are caused by a microscopic mits known as the "scaly leg mite." This pest gets under the scales of the shank and toes and naturally the advance stages are more marked on the older chickens. This is not a reliable rule to follow in selecting the old hens.

There are two methods for marking birds, which can be followed successfully. When the chicks are newly hatched, it is an easy matter to clip the rear toenail, which if [illegible] clipped will never grow out again. This will not cause the chick any inconvenience and serves as a means of identification. To illustrate: the rear toenail of the left foot of all the chicks hatched in 1923 can be clipped. In the 1924 hatch clip the rear toenail of the right foot. In this way in the spring of 1925 all the chicks hatched in 1923 can be sold

BABY CHICKS

Best Paying, Heavy Laying, Pure Bred Tom Barron English White Leghorns, S. C. Rhode Island Reds, Park's Barred Rocks. Strong Healty Chicks hatched from greatest and best incubator known. Chicks are given full twenty-one days and hatched under proper temperature.

The Court of Last Appeal

YOU are the judge and the jury. Your verdict is final. There can be no appeal—for this is the High Court of Public Opinion.

The wares of the world must appear before you—the product of every factory—the merchandise of every store. Those things that fail to measure up to your requirements are quickly condemned to oblivion.

The manufacturer who advertises deliberately places his merchandise on trial. He openly courts your critical inspection. He invites comparison. He directs your attention to his goods and then forces those goods to stand on their own merits.

If he were not sure of his wares he would not dare to advertise. For advertising would put him to a test he could not meet, and thus hasten the end of his business career. It would be business suicide.

You can depend on the man who advertises. He KNOWS his product is good.

That's one reason why it pays to read the advertisements you find in this paper. It is through advertising that you are able to keep in touch with the GOOD things that progressive business men are spending their money to introduce and to keep before you.

Base your judgment on the advertisements

and the newer hatched chicks can be marked with the 1923 system.

The average hen does not lay enough eggs to pay for her keep after the second year or laying season and unless she is of exceptional value as a breeder she should be disposed of. It is during the pullet year that the majority of hens make the best egg records and therefore it is good practice to feed for egg production the first year. The second year the hens that were the best layers and of strong vitality should be used for breeding. The third year they should be disposed of.

Another reason for culling hens is to keep down disease. For example one disease in particular is more evident in farm flocks than is generally thought of and that is tuberculosis. Where the disease is present in the flock, the older fowls show the larger percentage of infection and are usually in the advance stages of the disease. So culling will be a great help in doing away with this trouble.

We would not cull now if hens are laying, but do so as soon as the laying period is over this spring.

HOW TO PREVENT DISEASE

THERE is no doubt that fowls under modern forced conditions have more ills than fowls did years ago when they roamed the fields in an almost wild state. Forcing and pampering and inbreeding in various ways has caused it. But who would be willing to give up the various improvements and go back to the woods' fowls of various types and colors and laying about 59 eggs a year and that in the late springtime?

Thousands of progressive and successful poultrymen and up-to-date farmers are faithfully striving to banish the conditions which produce disease, and are living examples of how fowls should be kept for health. Fowls kept in close confinement with no possible chance to escape the existing conditions very frequently are subject to about as many ills as their keepers, and that means legion, it would seem. The great harvest of death among the feathered tribes due to the sins of commission and omission is too great even to estimate. As someone has said, "stop sinning and attend to business," applies admirably in this case.

The secret of sickness has been discovered. Disease is due to germs of a certain kind which devlop or sprout, if you please, when the conditions are just right, when the tilth—or rather the filth—is right. The blood and tissues of the fowl are the garden for the germs. The feed in the digestive tract is very often the seed-bed for these disease germs. You may read of them as microbes, basteria, ferments and the like. We are told that there are germs in a healthy organism which devour or destroy the enemy germs so that they fail to get in their work. They are of various names and character and so numerous that the average man of practical ideas does not have the time or the inclination to study them individually enough to do him any good in his life-work. On the other hand, it is very essential for him to know that stagnant pools of water with a green scum over it, stale garbage heaps, impure air, damp chilly houses and coops are all favorable breeding places for the disease germs, and hostile to the good health of poultry.

The question then resolves itself into whether the poultry man shall look well to the sanitary conditions with which he may surround his poultry by careful work, or utterly ignore all such things, allowing his flocks to drift into a state of disease and trouble at almost any time, and depend upon doctoring to get results.

Preventative measures not only consist in sanitary measures but in starting with good stock, and if any new fowls are purchased proceeding to put them through quarantine until you are satisfied that they have no diseases which may be transmitted to your own flocks before putting them with them. The same course should be pursued in handling your own stock. If any should develop disease take it away from the balance of the flock to treat it, and do it at once. Do not put it back until you are sure that all traces of trouble have passed. Should it be badly affected the safest remedy is the hatchet and burying deep or burning. Too close confinement in small

PULLETS, HENS AND COCKERELS
S. C. White Leghorns and S. C. and R. C. Black Minorcas. Must make room before cold weather. Almost ready to lay.
LAPHAM FARMS, Pinckney, Mich.

JOHN'S BIG BEAUTIFUL BARRED ROCKS are hen hatched, good layers, quick growers, light and dark matings, 30 eggs $3.50; 50-$5.00 postage paid circulars. **John Northon, Clare, Mich.**

SICILIAN BUTTERCUPS. GOOD YEAR around layers of large white eggs, also White Rocks, good laying strain. Eggs $1.50 per 15.
IDA PRAUSE, R. 3, Maple City, Michigan

HATCHING EGGS

HATCHING EGGS
S. C. White Leghorns. Tom Barron Strain, 250 egg utility line. November to April, average 65 per cent. Pure white plumage. Range grown, healthy, vigorous stock. Eggs $1.50 per 15; $4.00 per 50; $7.00 per 100. Prepaid. Limited supply. Order from this ad now.
MAPLEWOOD POULTRY FARMS
C. W. Bovee, Prop. North Star, Michigan.

BUFF ROCK EGGS BY 10 LB. MALES and 1st Cincinnati, Ohio winners. Hogan tested hens, heavy layers.
J. C. CLIPP & SONS, Box M, Saltillo, Ind.

THOROUGHBRED BUFF ROCK EGGS from Blue Ribbon Winners, $1.50 per 15; $9.00 per 100.
BALDWIN & NOWLIN, R. 4, Laingsburg, Mich.

ARISTOCRAT DARK BARRED PLYMOUTH Rocks. Foundation stock direct from Holterman's choicest matings. Eggs from special pen at $8 for 15 prepaid. From other pens at $3 and $5. Satisfaction guaranteed. **R. W. BRANDT, R. 4, Box B, Saginaw, W. S., Michigan.**

White and Barred Rock Eggs for Hatching. Pure, Prize winning, utility strains, selected pens, $1.35 per setting, flock $1.00 a setting, delivered P. P. special on quantity. **Dawson's Farm, R. No. 4, Muskegon, Michigan.**

BARRED ROCK HATCHING EGGS. NORMAN Heavy Laying Strain.
MRS. JESSIE B. DEAN, R. 1, Mason, Mich.

BARRED ROCK HATCHING EGGS. PARKS 200 egg strain. $2 per 15; $5 per 50; $10 per 100 by prepaid parcel post.
R. G. KIRBY, R. 1, East Lansing, Michigan.

White Rocks. Heavy Layers, Choice Birds. Prepaid guaranteed eggs, 15, $1.50; 50, $3.50; 100 $6.50. **Mrs. Florence Howard, Petersburg, Mich.**

FOR SALE—BARRED ROCK HATCHING EGGS from good winter layers. $1.25 per 15 or $2.00 per 30 postpaid.
Mrs. Frank Millikin, R. 1, Roscommon, Mich.

PURE BRED BUFF ORPINGTON EGGS AT $2 15; $5.50-50. Prepaid.
MRS. ANNA LA NOUE, Fostoria, Michigan.

THOMPSON STRAIN BARRED ROCK EGGS by 9 lb. males, bred to lay. Dark matings $1.75 per 15; $3.00 per 30 prepaid.
MRS. FRED KLOMP, St. Charles, Michigan.

SINGLE COMB RHODE ISLAND WHITES. Eggs now $1.75 per fifteen.
JNO. A. HARTGERINK, Box W., Zeeland, Mich.

ROSE COMB RHODE ISLAND REDS. HATCH-ing eggs $1.25 per setting. Postpaid.
Mrs. Albert Harwood, R. 4, Charlevoix, Mich.

REDS: BOTH COMBS, CHESTER COUNTY and Harrison Pierce strain. Eggs $1.50 per 15 postpaid. **Leo Van Conant, New Haven, Mich.**

EGGS FOR HATCHING—UTILITY STOCK. Grand White Wyandottes—M. A. C. Champions. Good, square deal. Reasonable prices. Send for price list.
C. W. HEIMBACH, R. 5, Big Rapids, Michigan.

WHITE WYANDOTTES MARTIN STRAIN, Eggs for hatching.
WAYNE CHIPMAN, R. 2, Washington, Mich.

SILVER LACED AND WHITE WYANDOTTES Four large, beautiful roosters. Eggs $1.50 per 15.
C. W. BROWNING, Portland, Michigan.

S. C. ANCONAS (SHEPPARD STRAIN) EX-cellent layers. Eggs $1.25 per 15.
MRS. GILBERT BROWN, Wheeler, Michigan.

SILVER SPANGLED HAMBURG Eggs for Hatching, $1.50 setting. Write for prices on all varieties.
ROSEDALE FARMS, Port Huron, Michigan.

BOURBON RED TURKEYS. EGGS 50c EACH.
THOS G. CALLAGHAN, Fenton, Michigan.

Mammoth Bronze Turkey Eggs for Hatching. Large, Pure, Disease-free birds, 55c each delivered P. P. **Dawson's Farm, R. 4, Muskegon, Mich.**

MAMMOTH PEKIN DUCK EGGS FOR SETTING $2.00 or two settings $3.00. Also **Wild Mallard** Duck eggs same price. Very choicest stock. All orders prepaid. **Cedar Bend Farm, Okemos, Mich.**

ROUEN DUCK EGGS BY SETTING OR 100
Mrs. Arthur Rutledge, R. 4, Big Rapids, Mich.

LEGHORNS

LEGHORNS
S. C. Buff Leghorn Hens, Pullets and Cockerels. Hens and pullets $2.50 each; cockerels $3.00 to $5.00 each. Show birds a matter of correspondence. **LAPHAM FARMS, Pinckney, Mich.**

PULLETS BARRON ENGLISH WHITE Leghorns, eight weeks to maturity—May to October. Breeding flocks repeatedly culled by experts. Extra large and vigorous. Wedge shaped bodies, big looped combs. "Lay-bilt" in every way. Also breeding cockerels. Satisfaction and more or money back.
MORSE WHITE LEGHORN FARM,
Belding, Michigan.

TURKEYS—DUCKS—GEESE

M. BRONZE TOMS, 16 LBS. $17.00; HENS, 10 lbs. $15; 5 eggs prepaid, $4; 10, $7.50.
RALPH WISE NURSERIES, Plainwell, Mich.

HIGHEST PRICES PAID FOR LIVE AND Dressed Poultry, Veal, Eggs. A square deal always.
C. E. McNEILL & CO.,
825 W. So. Water St., Chicago, Ill.

HOW TO PREVENT DISEASE

(Continued from Page 27)

houses with insufficient ventilation is a very common cause of disease. Let everything be light and airy and full of sunshine.

Keep the houses and coops clean and free from mites and lice, both of which are deadly enemies to fowls. Do not wait for a sign of mites to appear but go right after them, and use methods to destroy them if they are present.

The feeding should be carefully guarded, and nothing but the finest and soundest of grain and feedstuff used. Musty grain will put a lot of fowls on the dumps about as quick as anything we can think of. They may not get sick unto death right off but they will get mightly out of condition and be hard to get right again. Good fresh, cool water and shade are real essentials.

A great preventative of disease is found in the use of Epsom salts given once in two weeks during the hot months, and once a month during the rest of the year. It should be given at the rate of one-third teaspoon to the fowl, dissolved in water and then used to wet a mash for them; fed in the morning is preferable. This item is too important to be neglected, so take notice.

A TEN DOLLAR START

"WHEN I came out here on my little acre and a half, nine years ago, I had only $10 left on which to live until I could get a start with poultry," began Mrs. C. Jewett of Auburn. "I came largely for my health, since the doctors told me I wouldn't live. I had to do all the work myself, but it was the making of me and I built up my little home, which I would not trade for the best property in Seattle.

"I began with what few ducks I could buy and three duck eggs. A friend of mine received a half dozen eggs from England and she divided with me. All I got out of the setting was a drake, but I have kept him for breeding up the flock. I also secured some good African geese and I still have a gander, which I call Jiggers, and five hens.

"A few years later I got started with China pheasants by buying a few eggs. I had to pay a license of $10 to begin and $5 each year thereafter. I find that they pay well, mostly from the sale of eggs and young pheasants, but I prefer to sell the eggs, since there is less labor involved. This spring I took a contract to hatch 200 pheasant eggs for the county game commission and will use Japanese Silky hens, since they can handle pheasant eggs better than a larger hen. They also make good mothers for the young birds after they are hatched."

Mrs. Jewett also has a pen of Light Brahmas, which she is raising for the production of capons. She has found a good demand for well-fattened capons, and has a few which have been fattened over winter and weigh six pounds at the age of 7 months, dressed and drawn. This flock will be increased this year, and a new cockeral secured with the idea of producing as many capons as possible during the next few years.

In another pen Mrs. Jewett keeps a flock of hens which are crossed between White Leghorns and Wyandottes. While she does not recommend this cross, she merely gives the figures showing the egg production for January to show what can be done with a small flock. The 50 hens produced a total of 84 dozen eggs during the month, which were sold at an average of 27 cents a dozen. This made a total of $22, $14 of which was clear profit above the cost of feed. The birds got a balanced ration of scratch feed and egg mash together with such green feeds as cabbage, carrots and other roots furnished from the home garden. This pen will be kept as a commercial flock.

A few turkeys are kept merely to supply the demand for turkey eggs, and only a few eggs are hatched under hens which are not sold immediately for setting. A number of bantams are also kept about the place, partly for curiosities, and also to supply a small demand for eggs.

"I have had better success with my ducks and geese than I had ever expected and think it is one of the most interesting games of the poultry industry," remarked Mrs. Jewett. "I have only 19 ducks and three drakes, but I have gotten as many as 17 eggs a day and never get less than 13 at this time of the year.

"There has been a good demand for setting eggs and I have sold most of the eggs for this purpose. I can also get a good price for the young goslings and have found it profitable to set a few of the Rhode Island Red hens with duck eggs. They make good mothers, but I prefer to raise the ducklings under a home-made brooder and set the hens over again.

"I have always kept the ducks and geese in the same lot and find that they do not interfere with each other. A small pond or swiming tank is always kept full of running water and they are allowed access to this at all times. I have just 10 geese now, since I just sold off some of the best stock. There are two breeds, the Toulouse and the African. There is a demand for both the young stock and for the setting eggs, but I would just as soon sell the eggs, as I can easily get 50 cents each.

"Geese are very easy to raise, since they need very little grain during the summer, but will get the biggest part of their living from grass and other green stuff that can be spared from the garden. I have a small lot in which the geese and ducks are kept and I will have it plowed and seeded to rye. This will be fenced off and the birds turned in when the grain is about six inches high.

"While both the ducks and the geese are very fond of water, it is not necessary that they have access to a pond. The ducks are what are called dry land ducks and will get along with very little water. They are better contented, however, if they can have a small pond to swim in and it is not so hard to furnish such in almost any lot. It is also a good plan to furnish boxes or small houses where the ducks can have their nests. Some of them will lay on the ground, anyway, but it is well to encourage them to use the nests.

"I have a home garden in which I raise a large part of my table supply," explained Mrs. Jewett. "This is good garden soil, and I keep it well fertilized with hen manure and can grow almost anything. The garden also furnishes a good source of green feeds for the birds, and I can keep practically all of the pens supplied during the summer. While I have a large collection of flowers about the house. I do not plan on selling anything of this kind. They are used more to add beauty to the yard and to create a more home like appearance.

"It has been hard work to build up even as small a home as this, but it has been well worth while. I have done practically all of the work myself up until last summer, am 52 years old, and was never healthier in my life. I attribute it all to the abundance of outside air and exercise which a person gets when doing hard work of this kind. I have had good offers for my place, but have refused them all because I much prefer a home to the money it would bring. I would be a long time building up another, and I would probably spend the money before another home was completed."—Washington Farmer.

DISTINCT POULTRY BRANCHES

The poultry Business, east and west, is going broken up into several distinct branches—breeding, producing market eggs, producing market fowls, hatching, selling day-old chicks, etc., and Professor A. G. Lunn of the Poultry Department of the Oregon Agricultural college believes that if the entire east develops as a market producing section the demand for stock will find its way to the Pacific coast. Then if the time ever comes when the west can not compete with the east in commercial egg production our opportunity to develop poultry farms will come along the line of breeding.

JES' THE SAME

"A lot of talk," said Uncle Eben, "don't interest nobody ceppin' de person dat's doin' it; same as what you say to a mule or a pair o'dice."
—Washington Star.

HIGH COST OF MARRIAGE

"It's got so these days that a man can hardly wed unless he can show the girl two licenses."

"Two licenses?"

"Yes, marriage and Automobile."

I wish we could have The Michigan Business Farmer come every week. I can hardly wait two weeks for my paper, but the old saying is "good things come to he who waits."—E. G. Hale, Turner, Michigan.

The Agricultural and Business Situation

Revised Monthly by the Department of Research of the American Farm Bureau Federation.

A committee of eighteen economists called by Secretary H. C. Wallace to consider the agricultural outlook and to prepare a statement which will provide a basis upon which readjustment to meet the economic situation may be made by agricultural producers, reported on foreign and domestic demand and certain leading products as follows:

FOREIGN DEMAND:

The foreign outlook, on the demand side, seems slightly less favorable to our farmers in 1923 than it was in 1922. The favorable factors with respect to demand are: First, the influence of American prosperity upon the demand for European goods; and second, the possibility that the slight business recovery that has occurred in a number of European countries may gradually gain momentum. Despite the tariff, European exports to the United States in recent months have been considerably larger than for the same period a year ago.

The unfavorable factors are: First, the progressive piling up of Government debts on the continent of Europe, with its effect upon exchange, currency and business; second, the Ruhr situation.

DOMESTIC DEMAND:

Most competent observers seem to agree that we may expect general business prosperity to last at least six to nine months longer. If this opinion is correct, demand will be distinctly more active next autumn than it was last autumn insofar as the demand for farm products depends upon the purchase of American families, not themselves on the farms.

WHEAT:

The American exports of wheat during the last two years were unusually large owing to the low exports from eastern Europe, and continued low production in some countries in Europe. These exports should not be taken as normal nor be expected to continue permanently. The European countries are making efforts to put their grain production on a pre-war basis and as they become able to accomplish this it is to be expected that our exports will decline and that our production should be readjusted to meet these changing conditions.

The condition of the winter wheat crop in the United States is unfavorable. The intended plantings of spring wheat are 94.5 per cent of last year's acreage and weather thus far has been unafvorable for spring planting.

COTTON:

The world's consumption of American cotton in 1921-22 was about 12,600,000 bales; the indicated world's consumption for the year 1922-23 is not less than 13,000,000 bales. There is no evidence at present that the consumption of 1923-24 will fall below this figure.

The available information indicates, however, that the world carry-over of all cotton on July 31, 1923, will be 6,800,000 bales (largely of foreign short staple cotton), compared with 6,700,000 bales in 1922 and 10,500,000 bales in 1921, and that the use of American cotton will be little, if any, restricted on account of foreign production.

On the basis of farmers' intentions to plant 12 per cent greater acreage than they planted in 1922, the cotton acreage harvested in 1923 would be 36,888,000 acres. If the yield per acre in 1923 should prove to be the same as the average for the five years 1918-22, the total crop would be 11,810,000 bales.

TOBACCO:

The intended plantings for 1923 exceeds the acreage of 1922 by 10 per cent, the average acreage for 1918-22 by nearly 9 per cent, and the average acreage for 1909-13 by 55 per cent. Conditions of production and supply in the main control. There is nothing in the probable demand sufficient to offset the contemplated increase of 10 per cent in planted acreage; particularly when we consider that the 1922 acreage was above the normal and that the trend of prices since 1920 has, on the whole, been downward.

CORN AND HOGS:

The corn situation at this date is about normal, stocks on farms being almost exactly the same as the 5-year pre-war average. Between now and the time the new crop is harvested there will be some tendency toward corn shortage because of the large number of hogs on feed. Hog production has been heavy and is still in a state of expansion.

The prospects which producers must face before a year has elapsed is the absorption by domestic and foreign consumers of a surplus of over six million hogs and 250 million pounds of stored products. This represents a surplus of over seven million hogs, approximately 12 per cent, above last year's production.

Butter	155	157	129
Wool	211	211	133

4. Relative Purchasing Power of Farm Products:

(U. S. Bureau of Agricultural Economics)

The quantity of various commodities which a given amount of each farm product would purchase at prices prevailing in 1913 is put equal to 100. The figures given represent the percentage of this quantity which the same amount of farm products would purchase in February, 1923. Prices at the farm are used for agricultural products, and wholesale prices at central markets for other commodities.

	All Commodities	Cloths, etc.	Fuel, etc.	Metals, etc.	Building Mtls.	House Furn'gs
Cotton	143	113	106	161	117	122

MARKET FLASHES

MARKET SUMMARY

All grains are easy after declines in prices on opening day of week. Beans unchanged and inactive. Potatoes are easy with receipts fair. Butter and eggs active and firm. Receipts of live poultry exceed demand. Firm tone to dressed calves. Cattle not wanted. Hogs easy and lower. Sheep steady and higher.

(Note: The above summarized information was received **AFTER** the balance of the market page was set in type. It contains last minute information up to within one-half hour of going to press —Editor.)

FOOTE'S MARKET LETTER

By W. W. Foote

Good Agricultural Outlook

LABOR was never before so well employed throughout the United States, and wages are far the highest ever paid, with increasing wages in quite a number of lines of industry. The railroads are doing the greatest business on record; and people are spending more money than ever before, a great deal being expended for meats, flour and other farm products. Meanwhile, marketing of grain and live stock helps farmers to liquidate part of their indebtedness, and there are fewer applications received by country bankers from farmers for loans. Our exports to other countries are on a large scale, especially of provisions, these greatly exceeding such exports made a year ago. The government's forecast of planting, the first ever attempted, indicates an increased acreage of corn, oats, barley, flax, tobacco and cotton. In the southern states planters are reported to be lowering their corn acreage and materially increasing the cotton acreage. The past year was a very unfavorable one for marketing both Irish and sweet potatoes, because of overproduction, and consequently farmers are reported as lowering their acreage for these important vegetables. The spring was unusually late, and this means late seeding of crops in some places lessened planting. Naturally, there is widespread interest shown in the reports of large losses of pigs on account of the late cold, wet spring, but it is probable that these reports were overdrawn in numerous instances and losses will be partly offset by the much increased breeding in most farm districts. The recent advance in prices of lamb in Chicago and other markets was due to a great falling off in the receipts, the Colorado fed lambs having been mostly marketed, while the crop of southern spring lamb furnished by Kentucky and Tennessee will not be ready to market before June, owing to the late spring. Great interest is manifested in the sheep industry in the middle west, and farmers owning plenty of hardy breeding ewes may consider themselves in luck.

Curtailment of Wheat Acreage

Fluctuations in wheat prices during recent weeks were apt to be greater than usual, changing crop reports being the principal factor in the market. Not long ago prices were much higher, but deliveries on May contracts were about the largest on record, causing a temporary large reaction in quotations. At last the weather turned warm, after the long spell of unseasonably cold and wet weather, and crop prospects are improved. However, rains came too late, it is claimed, to make good crops in Nebraska and western Kansas, and a great many tracts of winter wheat fields of the southwest had to be abondoned. In the northwest many farmers have been insisting upon getting higher prices for their wheat, and it is reported that foreigners have been buying wheat in the Canadian northwest, oriental business being especially heavy. Our exports of wheat and flour week after week are running far ahead of last year, while prices are much lower than at that period. The visible wheat supply in the United States is not looked upon as unduly large, although it is 44,521,000 bushels, comparing with 31,281,000 bushels a year ago. Rye, which is in large demand for export, mainly to Germany, is much below the prices paid a year ago, with the visable supply up to 19,459,000 bushels, whereas a year ago it was down to 8,163,000 bushels. Corn and oats exports are much less in volume than a year ago, while supplies in sight are much less than then, the oats visible supply being only 21,932,000 bushels, comparing with 55,837,000 bushels last year. Taking a wide-spread view of general conditions, the outlook for the grain markets appears to be encouraging. Late sales for May delivery were made in Chicago of wheat at $1.20, comparing with $1.39½ a year ago; corn at 81 cents, comparing with 62 cents a year ago; oats at 44 cents, comparing with 37½ cents a year ago; and rye at 82 cents, comparing with $1.06⅝ a year ago.

The Cattle Outlook

While it is difficult to tell what the future will bring forth, from all that can be learned it may be said that better prices are expected within the next two or three months. More feeding was carried on in important cattle feeding districts last winter, and the mild weather greatly favored owners, as less corn than usual was needed. Marketings of cattle for the year so far show heavy increases over corresponding periods in recent years, and liberal supplies are expected so long as the supply holds out. But decidedly fewer stock and feeder cattle have been shipped from the western markets than a year ago, owing to the fact that many farmers thought the prices asked for well-bred stockers and feeders were too high as compared to prices prevailing for finished beef steers. The nearness of the grazing season has started up somewhat larger buying for stock cattle, but as yet shipments to country points have been only moderate in numbers. However, some of the veterans in stock feeding are going to continue in the business the same as ever, and James W. Wadsworth, United States senator from western New York, showed up in the Chicago stock yards recently for the purpose of buying about twenty car loads of thin cattle for feeding. He said farmers in his part of the country were in the habit of grazing a great many cattle for autumn marketing, and they see no reason for abandoning the custom now. Mr. Wadsworth divided his purchases pretty evenly between steers and cows. The cows average from 850 to 950 pounds, and he estimated that they would show average summer gains of about 275 pounds. Recent sales of stockers and feeders in Chicago have been largely at $7 to $8.25, a few prime fleshy lots of feeders selling up to $8.50 to $9. Beef steers have been bringing $6.75 to $7.50 for the cheaper class of light weights up to $9 to $10 for the better class of steers carrying good weight, with a few extra fine lots going as high as $10.25. The bulk of the steers go at $8 to $10. Cows and heifers sell mainly at $5.25 to $8, prime heifers going as high as $9 to $9.25. Calves sell mostly at $8.50 to $10 per 100 pounds. Milkers and springers are wanted at $60 to $95, prime Holstein cows going highest.

Abundance of Hogs

Farmers have been breeding swine to a remarkably large extent for a year, and the result is vastly larger marketings at packing points this year than for recent years. It happens that the consumption throughout the country of lard, fresh and cured meats has been almost phenomenally large for many months, and this has been an important factor in the hog market, while exports of lard and cured meats have kept on running from week to week far ahead of a year ago in volume. But the marketing of hogs in Chicago and Missouri River markets has been much larger than in other years that stocks of provisions are piling up, and this is a bearish factor that cannot fail to make itself felt in making hog values. Hogs in Chicago market show up well in quality, their recent average weight being 238 pounds, and the highest prices are obtained for prime light bacon hogs. Reactions in prices are to be expected of course from time to time, but the prevailing belief is that later on values will go lower. The advance in corn prices has caused many stockmen to hurry up shipments of cattle and hogs to market. Last week's Chicago receipts ran far larger than a week earlier, sales ranging at $6.50 to $8.30. The best light lots sold a dime higher than the best heavy butchers. Western packing for the summer season, beginning March 24, is reported as 7,464,000 hogs, comparing with 4,696,000 a year ago.

High Prices for Lambs

Most of the Colorado fed lambs have been shipped to market, and as the spring lambs of Kentucky and Tennessee will not be ready for marketing until June because of the cold, wet spring, there has been a real scarcity of fat lambs in the Chicago market lately and the highest prices of the year. The best wooled lambs have sold up to $15.35 per 100 lbs. but lambs are now mostly clipped before marketing. Heavy clipped lambs are wanted part of the time for export, and foreign buyers are the only active ones for such flocks. Exports of such lambs from Chicago for the year to recent date amount to 7,500 head. During a recent week exporters purchased about 600 shorn lambs which averaged around 105 pounds. The wool market is extremely firm. Meager receipts last week made higher prices, clipped lambs selling at $10.50 to $13.15.

WHEAT

Wheat prices show decided declines for the past week and declines were made in the face of unfavorable news which appeared on the market nearly every day of the week. Weather that helped the winter wheat outlook was mainly responsible for the weakness in the market. There was rain over a great deal of the dry country and the crop gained in many places although the rains came too late to do much good in the worst district of the southwest, where abandoned acreage makes a large total. The weather over the spring wheat states improved also, and this is too late to prevent the abandonment of much land and the substitution of other crops for wheat. The seeding of spring wheat is about three weeks late and not more than half finished in some of the important states, giving the crop a very doubtful promise. The unfavorable conditions were all known a week ago when prices were high and the better weather of last week caused much selling for the taking of profits bringing a weak tone. There are many bearish dealers in the market. They believe the pressure of cash wheat will force prices down in the absence of an active foreign demand. The export business improved during the week, but the foreigners took Canadian wheat in nearly all cases and the supply in this country seeking a market is very large. Austrailia reports an export surplus this year of less than half the previous year's exports.

Prices

Detroit—Cash No. 2 red, $1.32; No. 2 white, $1.32; No. 2 mixed, $1.32.

Chicago—Cash No. 2 red, $1.25; No. 2 hard, $1.19¾@1.20¼.

New York—Cash No. 2 red, $1.42¾; No. 2 hard, $1.32¼.

Prices one year ago—Detroit, Cash No. 2 red, $1.37; No. 2 white and No. 2 mixed, $1.35.

CORN

Corn weakened some last week but prices did not decline as much as in wheat because of small receipts and good demand from various industries. Only 971,000 bushels was received at Chicago last week while 2,397,000 bushels was shipped out. This naturally caused a decrease in stocks and had a steadying effect on the market. Corn for September delivery is weak at present as weather is generally favorable for spring work and much plowing has been done and indications are that this year's acreage will show a fair increase over last year. Export trade has been fair.

Prices

Detroit—Cash No. 2 yellow, 86c; No. 3, 85c; No. 4, 83c.

Chicago—Cash No. 2 mixed, 79½@80½c; No. 2 yellow, 80½@81c.

New York—Cash No. 2 yellow, and No. 2 white, 98½c; No. 2 mixed, 98c.

Prices one year ago—Detroit, No. 2 yellow, 67c; No. 3, 65½c; No. 4, 64c.

OATS

The oat market is somewhat improved in tone because of a good volume of business which the market has enjoyed the past week. Country offerings to arrive are practically nil.

Prices

Detroit—Cash No. 2 white, 50½c; No. 3, 49c; No. 4, 47½c.

Chicago—No. 2 white, 45½@46½c; No. 3, 45@46c.

New York—Cash No. 2 white, 55½@56c.

Prices one year ago—Detroit, Cash No. 2 white, 45c; No. 3, 43c; No. 4, 40c.

RYE

Rye seems to be in good demand and prices are holding steady at many points. The market is quiet at Detroit.

Prices

Detroit—Cash No. 2, 81½c.

Chicago—Cash No. 2, 78¾@79¼c.

Prices one year ago—Detroit, Cash No. 2, $1.08.

BEANS

There has been a small decline in the price of beans during the last week but it is believed that this is only temporary and that the price will advance in the near future. There are no more beans in Michigan than are needed and orderly marketing will bring the price up. There is a campaign on to increase bean acreage throughout the country, according to reports, and it is intended to increase consumption by educating the consumer to make beans a more important part of his food.

Prices

Detroit—C. H. P., $6.80 per cwt.

Chicago—C. H. P., $7.25@7.75 per cwt.

Prices one year ago today—Detroit, C. H. P., $7.20 per cwt.

POTATOES

Old potatoes reached the highest price level of the season during the fore part of the past two weeks but the price did not hold owing to large receipts of new potatoes. Shipments have been light. Floods have held up shipping from Maine and the growers of Michigan are inclined to wait for higher prices. Smallness of receipts has not been felt to any extent as yet as most markets had a good supply on hand. The tone of the Detroit market is easier.

Prices

Detroit—Michigan, $1.43 @ 1.50 per cwt.

Chicago—Wisconsin and Round whites, $1.10 per cwt.

Prices one year ago—Detroit, Michigan, $2.06@2.17 per cwt.

HAY

The hay markets generally have been steady especially on the top grades. Good qualities have continued firm at most markets because of light receipts, but poorer sorts are abundant and are generally dull and lower. Country shipments are diminishing on account of spring work and although the demand is of moderate volume, markets are steady at the close. Clover and mixtures are dull except in the west.

Prices

Detroit—No. 1 timothy, $17.50@18; standard $16.50@17; light mixed, $16.50@17; No. 2 timothy, $15.-

50@16.50; No. 1 clover mixed, $14 @15; No. 1 clover, $13@14.

Chicago—No. 1 timothy, $21@22; light mixed, $19@20; No. 2 timothy, $18@20; No. 1 clover, $15 @16; No. 2 clover, $13@14.

New York—No. 1 timothy, $27; standard, $13@16; No. 2 timothy, $23@26; No. 1 clover mixed, $26@27.

Prices one year ago—Detroit, standard timothy, $21@22; No. 2 timothy, $20@21; No. 1 light mixed, $21@22; No. 1 clover, $16@17.

Alfalfa—Detroit, $13@17; Chicago, $16@23.

WOOL MARKETS

Midwestern wool trade remains on about the levels recently established, with a good firm tone. Prices are about unchanged from the previous week, but reports of contracting at higher levels in the west lend a feeling of strength to the local situation.

Foreign markets are closing their sales at firm to higher levels, and the position of holders seems, in the eyes of most of the trade, to be a strong one.

Quotations on midwestern or so-called "native" wool in large lots—such prices as are obtained by the farmers' pools—are as follows (f. o. b. Chicago): Fine and medium staple, 56@57c; ½ blood staple, 54 @55c; ½ blood clothing, 51@52c.

BUSY PLOWING FOR CORN AND SEEDING OATS

Crop report for southern part of Jackson county: Weather very dry. Rain needed. Farmers very busy plowing for corn and seeding oats. Clover seeding in bad shape. Help very scarce. Many farmers leaving farms. If the bars of immigration are not let down the farmers will be without labor to run the farms, as all the farm help has left the country to work in the cities, and wages are so high that the farmers can not pay them, and make expenses.—G. S.

PRITCHARD'S
WEATHER
FORECAST
INTERPRETED BY THE STARS

Week of May 13

THE early part of the week of May 13 will be stormy and the latter part mostly fair in Michigan. Temperatures will average normal or above during first part and below last part.

During first few days winds will be strong and rainfall quite heavy in sections but during middle part of week skies will clear, air become drier and temperatures fall to or almost to frost levels. At end of week possible frost will endanger early cherries, early strawberries, grape and garden truck.

Pastures and winter wheat will not have rapid growth at this time. Germination of rye and oats will be slow. Some early corn and potatoes can be planted at end of week and plowing for beans and late potatoes can be started.

Week of May 20

Average temperatures for this week will range below normal. From the beginning of the week until the middle part they will be rising but from then until the following Sunday they will be falling.

Generally fair weather is to be expected in Michigan during early part of week but during middle days, especially Wednesday, Thursday and Friday, light to heavy showers of rain are to be expected with electrical storms in scattered sections. The week ends with fair weather.

Season Backward

The next few weeks will prove backward to the average Michigan farmer and there will be much delay in planting and other outdoor operations. Plant on well drained land. To insure proper germination plant just prior to warm periods or as late in the season as practical.

LEGISLATURE CLOSES SESSION IN WAR-LIKE ARRAY

(Continued from Page 3)

eases among bees, by the establishment of sanitory regulations and quarantine rules was passed by the Senate 30 to 0. The bill is aimed chiefly to prevent the spread of foul brood among Michigan bees.

Defeat of the Smith automobile weight tax bill by a vote of 41 yeas to 56 nays marked to climax of the closing hours of the 52nd session of the Michigan state legislature. The final vote was preceeded by one of the most intense and dramatic debates in the history of Michigan's law-making bodies.

Acting under a "call of the House," which prevented any members from leaving the chamber, the fight was waged back and forth for two hours while the members and spectators who packed the galleries and side lines to capacity went without their dinner until 2:30, when the final roll call was taken.

Debate on this bill was tinged more or less with the intense bitterness which was developed among the representatives by the Governor's gas veto. Rep. Chas. Evans, leader of the "bitter-enders" among the gas tax forces voiced this sentiment when he said "This has ceased to be a question of a gas tax or a weight tax. It is now a question of whether or not representative government shall prevail in Michigan." He said that the eyes of the people from every section of the state were riveted on the actions of the members of the House and declared that the methods used to secure the passage of the weight tax bill endangered the integrity of the state. He voiced the sentiment that when 80 representatives and 19 senators should vote for a measure which they felt that their constituents demanded, it was hardly fitting for the Governor to exercise his veto power.

Rep. Evans quoted Sen. Sligh's remark that the weight tax bill was "conceived in sin and born in iniquity" and declared that the real purpose of the bill was not to raise more revenue but to place the state highway department under the control of the State Administrative Board. Rep. John Espie of Clinton county voiced similar sentiments when he said that to pass this measure would make the state highway commissioner a mere office boy for the administrative board and would assist to build up a more powerful political machine in Michigan.

Voicing additional protests against the passage of the bill, Rep. Elijah Howarth of Royal Oak pointed out the big loss which would be sustained by the counties under the system of distributing the highway funds proposed by the weight tax, which returns only one third of the receipts to the counties instead of one half as at present. Other speakers who spoke in opposition to the final passage of the bill were Rep. David Butler of Lapeer county and Rep. Dykstra of Grand Rapids.

After calling the speaker pro tem to preside, Speaker Geo. Welsh of Grand Rapids took the floor in support of the bill. He vindicated his own stand in the matter and urged the members to vote in accordance with their convictions. He declared that if representative government were in danger in Michigan it was not because of our able Governor but because the members feared to vote as they saw fit. Finally some one moved the previous question and further debate was shut off and the representatives lined up as follows:

YEAS: Barnard, Bartlett, Braun Gus. A., Bristow, Burns, Carter, Corliss, Culver, Dacey. Farrier, Ferris, Frees, Green, Hewlett, Ray L., Howell, Jewell, Johnson, Jolly, Ladd, Lee, Little, Lennon, McKinnon, Manwaring, Miles, O'Brien, Ormsbee, Palmer, Raucholz, Read, Richardson, Sargent, Smith, Stevenson, Titus, Wardell, Watson, Geo. C., Watson, Joseph E., Wood, Woodruff. Welsh—41.

NAYS: Baxter, Bradley, Brake, Braman, Brown, Geo., Bryan, Butler, Byrum, Curtis, Dawe, Deshano, Dexter, Dykstra, Emerson, Espie, Evans, Fuller, Gillett, Haight, Holland, Hosking, Howarth, Hubbard, Hulett, Orvy, Jones, Kirby, Kooyers, Lewis, Chas. F., Lewis, Rollie L., Long, Look, MacDonald, McEachron, Meggison, Miller, Ming, Morrison, Nevins, O'Beirne, O'Connell, Odell, Osborn, Pitkin, Preston, Rasmussen, Richards, Robertson, Rowe, Roxburgh, Sanson, Strauch, Thomas, Town, Wade, Warner, Wells.—56.

It was a foregone conclusion that if the House should kill this bill that the Senate would kill the Byrum income tax and the Meggison primary school fund bill.
